SELECTED WATER RESOURCES ABSTRACTS

VOLUME 10, NUMBER 5
MARCH 1, 1977

The Library of the
MAY 3 1977
University of Illinois
at Urbana-Champaign

W77-02076 -- W77-02575
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 10, NUMBER 5
MARCH 1, 1977

W77-02076 -- W77-02575

ecretary of the U.S. Department of the Interior has de-
ed that the publication of this periodical is necessary in the
ction of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

1A. Properties

CONFIGURATION INTERACTION STUDIES OF THE EXCITED STATES OF WATER,
Aerospace Corp., El Segundo, Calif.
N. W. Winter, W. A. Goddard, III, and F. W. Bobrowicz.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A010 599, Price codes: A03 in paper copy, A01 in microfiche. Report No. SAMSO-TR-75-129, April 15, 1975. 29 p, 4 tab, 40 ref. F04701-74-C-0075.

Descriptors: *Water chemistry, *Water properties, *Molecular structure, *Mathematical studies, *Water structure, Equations, Laboratory tests.
Identifiers: *Excited states, *Water molecule, *Configuration interactions, *Electron impact excitation, *Transition energies, Electron orbitals, Excitation energies, Rydberg constant, Electron impact spectra.

The results of extensive configuration interaction studies of 16 excited states of water were reported. These states can be accurately described as corresponding to excitation from one of the highest two molecular orbitals (1b sub 1 or 3a sub 1) of the ground state into either the 3s or one of the three 3p Rydberg orbitals. The results provide the most accurate and consistent treatment of these states to date (within 0.1 eV for all known transitions) and form a reliable basis for the assignment of the photon and electron impact spectra of H2O. 2A. General

UTILITY OF URBAN RUNOFF MODELING, (PROCEEDINGS OF A SPECIAL SESSION, SPRING ANNUAL MEETING, AMERICAN GEOPHYSICAL UNION, WASHINGTON, D.C. 14 APRIL 1976.
American Society of Civil Engineers, New York.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 460, Price codes: A07 in paper copy, A01 in microfiche. ASCE, Urban Water Resources Research Program Technical, Memorandum No. 31, July, 1976, 126 p., 8 tab., 32 fig., 99 ref. OWRT C-5045(No. 4224)(7).

Descriptors: *Urbanization, *Urban runoff, *Computer models, *Local governments, *Water pollution sources, *Project planning, *Automatic control, *Design, Data collections, Storm drains, Water quality control, Land use, United States, Rainfall-runoff relationships, Forecasting, Detention reservoirs, Canada, Australia, Combined sewers, Simulation analysis, Cities, *Urban drainage, Mathematical models, Model studies.
Identifiers: *Urban rainfall-runoff-quality relationships, Storm sewer discharges, Combined sewer overflows, Urban runoff gaging, Federal Republic of Germany.

The proceedings of a Special Session, Spring Annual Meeting, American Geophysical Union, Washington, D.C., 14 April 1976 include three invited papers by a Panel on Local Government Model Use and Need, seven related invited papers, two written discussions, and the full text of all Session floor discussion. A third of the about 60 participants contributed to the floor discussion, which occupied two-fifths of the total Session duration. The thrust of the Session was an attempt to define reasons why mathematical models of urban runoff should be used more extensively and more effectively in local government projects; that is, why the use of more sophisticated models would be more cost-effective than simpler, traditional procedures. Rationales were identified for planning, design and automatic control applications. The Session provided an outstanding opportunity for communication between users of the findings of research products and science-oriented researchers.

A MODEL FOR PREDICTING FLOOD HAZARDS DUE TO SPECIFIC LAND-USE PRACTICES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
B. B. Ross, D. N. Contractor, E. A. Li, V. O. Shanholtz, and J. C. Corr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 389, Price codes: A06 in paper copy, A01 in microfiche. Virginia Water Resources Research Center, Blacksburg, Bulletin 99, September 1976, 118 p, 36 fig, 18 tab, 99 ref. OWRT A-062-VA(2).

Descriptors: *Overland flow, *Channel flow, *Computer models, Infiltration, Land use, *Finite element analysis, Model studies, *Virginia, *Precipitation excess, Hurricanes, Simulation analysis, *Flood forecasting, Watershed management, Rainfall-runoff relationships.
Identifiers: *Hydrologic response units, *Hurricane Camille, Flood hazards, *South River watershed(VA).

This investigation developed a finite element model for mathematically routing overland and channel flow when rainfall excess is known. To determine rainfall excess, a procedure was developed to subdivide a drainage area into similarly responding units, defined as hydrologic response units. These units were functions of soil texture, soil depth, land use, and hydrology group classification. A computer model, based on the Mein and Larson and Holtan infiltration equations, was developed to generate excess precipitation for each hydrologic response unit. A finite element grid, devised for both the watershed and the main streams, allowed use of the hydrologic response units within an element to obtain weighted rainfall excess values for each element. A one-dimensional finite element scheme, in conjunction with Galerkin's residual method, simulated overland and open channel flow. Hurricane Camille (August 1969) provided an event by which the model was tested and calibrated on the South River watershed in Augusta County, Virginia. Having the ability to report changes in land use, the finite element procedure allowed several arbitrary land-use changes to be incorporated into the model in order to observe the river's response under flood conditions. The effects of changes in the number and size of the elements in the watershed and in the streams also were observed, along with changes in the size of the time increment.
W77-02078

AN ANALYSIS OF THE EFFECTS OF PARAMETER UNCERTAINTY IN DETERMINISTIC HYDROLOGIC MODELS,
International Inst. for Applied Systems Analysis, Laxenburg (Austria).
E. F. Wood.
Water Resources Research, Vol. 12, No. 5, p 925-932, October 1976. 12 fig, 1 tab, 6 ref.

Descriptors: *Parametric hydrology, *Model studies, Analytical techniques, *Flood frequency, *Simulation analysis, *Rainfall-runoff relationships, Stochastic processes, Water resources, Water loss, Systems analysis, Equations, Risks.
Identifiers: *Deterministic models.

The uncertainty in the output of deterministic models, due to the uncertainty in the parameters of the model, is analyzed and compared to current procedures of using average values for the uncertain parameters. The present analysis considers an analytical rainfall-runoff flood frequency model where the infiltration parameter is considered as a stochastic variable. The same conceptual procedure can be used to analyze fixed but uncertain (unknown) parameters. The extension to analyzing parameter uncertainty in large simulation models is indicated, and the importance of such analyses is discussed. (Bell-Cornell)

SELECTION OF STREAMFLOW AND RESERVOIR-RELEASE MODELS FOR RIVER-QUALTIY ASSESSMENT,
Geological Survey, Jackson, Miss.; and Geological Survey, Lakewood, Colo. Water Resources Div.
M. E. Jennings, J. O. Shearman, and D. P. Bauer.
Available from Branch of Distribution, USGS, 1200 S. Eads St., Arlington, VA, 22202. Circular 715-E, 1976. 11 p, 4 fig, 1 tab, 35 ref.

Descriptors: *Mathematical models, *Streamflow, *Reservoir releases, Model studies, Methodology, Reviews, Project planning, Water quality control, Hydrology, Evaporation.
Identifiers: Flow routing.

Sound water-resource planning requires consideration of realistic alternatives. Digital models, based on hydraulic and hydrologic principles and utilizing adequate input data, can be used to simulate the response(s) of a water-resource system to various alternatives. Streamflow and reservoir modeling methods are reviewed, including a discussion of general data requirements. Guidelines for model selection are presented with both hypothetical and actual studies used to illustrate possible selection procedures. (Woodard-USGS)

MATHEMATICAL MODELS IN HYDRAULICS AND COASTAL ENGINEERING,
International Courses in Hydraulic and Sanitary Engineering, Delft (Netherlands).
M. B. Abbott.
Terra et Aqua, No. 11, p 8-17, 1976. 13 fig, 12 ref.

Descriptors: *Mathematical models, *Mathematical studies, *Hydraulics, *Coastal engineering, Model studies, Research and development, Design, Hydrologic data, Mathematics, Environment.
Identifiers: *One dimensional, *Two dimensional, Model calibration, Three dimensional.

The paper described various aspects of mathematical models and their applications in hydraulics and coastal engineering problems. Mathematical models were advocated not as a replacement for physical modeling, but as a complementary tool to solve hydraulic problems. It was pointed out that the possibilities of making serious errors are much greater with the mathematical approach. It was also emphasized that mathematical modeling

UNIV. OF ILL. URBANA-CHAMPAIGN

should be integrated closely with the rest of the investigation and design process which implied that the organizations best suited to build these models are the ones that possess extensive facilities for field measurements, laboratory testing, instrument development, data processing, and problem analysis. PROGRAM REPORT-FY 1975, ATMOSPHERIC AND GEOPHYSICAL SCIENCES DIVISION, PHYSICS DEPARTMENT.
California Univ., Livermore. Lawrence Livermore Lab.
Report UCRL-51444-75, October 8, 1975. 36 p, 11 fig, 42 ref, 2 append. ERDA W-7405-Eng-48.

Descriptors: *Projects, *Model studies, *Atmosphere, Mathematical models, Air pollution, Climatology, Nuclear wastes, Nuclear explosions, Remote sensing, Satellites(Artificial), Precipitation(Atmospheric), Forests, Dusts, Boundary layers, Meteorology.

The FY 1975 research program conducted by the Atmospheric and Geophysical Sciences Division and supporting segments at Lawrence Livermore Laboratory was reviewed briefly. Specific projects were described, and significant findings of the work were indicated. Unique numerical modeling capabilities in use and under development were described; these tools can be brought to bear on many energy-environmental relationships and problems. (Sims-ISWS)
W77-02157

PRECIPITATION ON INTERMOUNTAIN RANGELAND IN THE WESTERN UNITED STATES,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
K. G. Renard, and D. L. Brakensiek.
In: Watershed Management on Range and Forest Lands. Proceedings, 5th Workshop of the United States/Australia Rangelands Panel, Boise, Idaho, June 15-22, 1975. Utah Water Research Laboratory, College of Engineering, Utah State University, Logan, Utah. p 39-59, 14 fig, 4 tab, 49 ref.

Descriptors: *Rainfall, *Rainfall disposition, *Rain gages, *Ranges, Seasonal, Rainfall intensity, Atmospheric pressure, Orography, Thunderstorms, Depth-Area-Duration analysis, Snowfall, Weather patterns, Photogrammetry, Precipitation(Atmospheric).

Precipitation varies widely in basin and range areas as well as major mountain areas in most of the western United States rangeland. Precipitation characteristics depend on the atmospheric moisture source, season, elevation and other factors. Much of the winter moisture in western rangeland areas is due to Pacific Ocean moisture carried into the area by prevailing westerly winds; such winds may cause orographic precipitation patterns with more rainfall and snow at high elevations. In other seasons, and especially in the southwestern U.S., atmospheric moisture results from slow air movement from the Bermuda high pressure area toward a thermal low pressure area; thunderstorms are common under such conditions. These and other rainfall events are discussed. Orographic precipitation patterns, redistribution of blowing snow and small thunderstorms contribute to the steep isohyetal gradients and limit rain gage data except at the point considered. Other topics considered include distribution of rainfall depths, thunderstorm patterns, low elevation winter precipitation, measurement by a dual gage system and by photogrammetry, and snowmelt studies. THE ANNUAL VOLUME OF U.S. PRECIPITATION AND ITS VARIATIONS FOR THE PERIOD 1931-1971,
Eastern Washington State College, Cheney. Dept. of Physics.
J. R. Marshall.
Journal of Geophysical Research, Vol. 81, No. 24, p 4485-4486, August 20, 1976. 1 fig, 2 tab, 2 ref.

Descriptors: *Precipitation(Atmospheric), *Annual, *United States, Volume, Average, Fluctuations, Weather, Droughts, Wet seasons, Variability, Climatology.
Identifiers: *Precipitation variations.

The average annual volume of United States precipitation was calculated to be 5759 cu km for the 41-yr period from 1931 through 1971 inclusive. The standard deviation was + or - 7.1%. The extremes were 15% (1957) and -14% (1956). A significant conclusion was that wet years are more numerous than dry years; but, on the average, dry years are drier than wet years are wet. (Sims-ISWS)
W77-02483

A TECHNIQUE FOR ESTIMATING TROPICAL OPEN-OCEAN RAINFALL FROM SATELLITE OBSERVATIONS,
Hawaii Univ., Honolulu. Dept. of Meteorology.
B. J. Kilonsky, and C. S. Ramage.
Journal of Applied Meteorology, Vol. 15, No. 9, p 972-975, September 1976. 5 fig, 13 ref. NSF DES 74-22685.

Descriptors: *Remote sensing, *Rainfall, *Oceans, *Pacific Ocean, Satellites(Artificial), Analytical techniques, Data processing, Correlation analysis, Estimating, Clouds, Storms, Meteorology.

A procedure has been devised for extracting the frequency of highly reflective clouds from visual satellite picture mosaics of the tropical Pacific Ocean. Over the period May 1971 through April 1973, monthly frequencies of highly reflective clouds were statistically tested for a regression relationship with 820 station-months of coral island rainfall. The correlation coefficient was +0.75 while the line of regression passed near the origin and was equidistant from the abscissa and ordinate. The F calculated from an analysis of variance table was highly significant at the 1% level. The rainfall estimated from highly reflective cloud frequencies was then compared to other tropical Pacific Ocean climatological rainfall estimates. (Sims-ISWS)

THE SURVIVAL OF ICE PARTICLES FALLING FROM CIRRUS CLOUDS IN SUBSATURATED AIR,
California Univ., Los Angeles. Dept. of Meteorology.
W. D. Hall, and H. R. Pruppacher
Journal of the Atmospheric Sciences, Vol. 33, No. 10, p 1995-2006, October 1976. 9 fig, 4 tab, 45 ref, 1 append. NSF DES75-09999.

Descriptors: *Ice, *Cloud physics, *Model studies, Clouds, Crystals, Particle shape, Sublimation, Evaporation, Equations, Mathematical models, Temperature, Air temperature, Humidity, Moisture, Meteorology.
Identifiers: *Cirrus clouds, Ice particles.

A theoretical study was carried out to determine the relevant microphysical processes which control the survival distance of ice particles falling from cirrus clouds in subsaturated air and to determine the atmospheric conditions which are necessary for such particles to 'seed' lower level supercooled clouds and thereby initiate glaciation. Differential equations were developed which describe the heat and mass transfer during the evaporation of cirrus ice particles. In these equations, forced convection and kinetic effects were included. Spherical, columnar, and plate-like ice particles were considered. The effect of radiative heat exchange between an ice particle and its environment was studied in terms of maximum and minimum physical limits for the upward and downward radiation fluxes. Using these limits and the known emission and absorption properties of ice, it was concluded that radiative heat transfer changes the survival distance of columnar ice crystals falling from cirrus clouds by less than 10% if the relative humidity of the environmental air is less than 70%. Considering the radiative effects and a wide range of values for the initial size and ice particle bulk density and for the temperature and humidity conditions of the ambient air, the present theoretical model showed that ice particles could survive distances of up to 2 km when the relative humidity with respect to ice was below 70% in a typical mid-latitude atmosphere. Larger survival distances are possible only if the ambient air has relative humidities larger than 70%. The theoretical model was compared to several field observations on evaporating cirrus ice particles. Good agreement was found with observational data when the atmospheric temperature and humidity profiles were available for the site at which the ice particles were sampled. (Sims-ISWS)
W77-02488

EVOLUTION OF RAINDROP SPECTRA WITH COLLISION-INDUCED BREAKUP,
Toronto Univ. (Ontario). Dept. of Physics.
R. List, and J. R. Gillespie.
Journal of the Atmospheric Sciences, Vol. 33, No. 10, p 2007-2013, October 1976. 3 fig, 23 ref.

Descriptors: *Raindrops, *Cloud physics, *Model studies, Mathematical models, Distribution, Particle size, Precipitation(Atmospheric), Laboratory tests, Coalescence, Rain, Equations, Meteorology.
Identifiers: *Raindrop breakup, Raindrop spectra, Drop collisions, Raindrop size, Rain processes.

A numerical model was set up to study the evolution of raindrop spectra by collision-induced breakup as measured in the laboratory. The main conclusion was that drops with diameters larger than 2-3 mm, falling in a population of smaller drops typical of natural rain, break up in comparatively short times (1-5 min in rainfalls of 100 mm/h). The presence of large drops (4-6 mm) in (cold) rain produced by the Wegener-Bergeron-Findeisen mechanism through melting of ice particles can be attributed to the short time available for large drops to break up in sufficient numbers during the time of fall after melting. Large drops are scarce in (steady-state) warm rain because they break up in collisions and rarely reach diameters larger than 2.5 mm. Hence, the standard notion of a critical diameter of 5-6 mm which raindrops are supposed to reach before breakup due to aerodynamic instability is no longer acceptable. (Sims-ISWS)
W77-02489

USE OF THE LANDSAT-2 DATA COLLECTION SYSTEM IN THE COLORADO RIVER BASIN WEATHER MODIFICATION PROGRAM,
Bureau of Reclamation, Denver, Colo. Div. of Atmospheric Water Resources Management.
A. M. Kahan.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-16525, Price codes: A02 in paper copy, A01 in microfiche. Report NASA-CR-146035, March 31, 1975. 11 p, 2 fig, 2 tab. NASA LANDSAT Inv. No. 23030.

Descriptors: *Remote sensing, *Equipment, *Instrumentation, Precipitation(Atmospheric), *Weather modification, Snow cover, Water resources, Water temperature, Winds, Weather data, Data collections, Hydrologic data.
Identifiers: *LANDSAT, *Data collection platforms, Satellite data collection systems.

This report described the progress made during the initial quarter of the Bureau of Reclamation's LANDSAT follow-on investigation. This investigation was conducted within the Bureau's Colorado River Basin Weather Modification Program, with primary emphasis away from the demonstration and testing of the LANDSAT Data Collection System toward its use as an operational tool in monitoring weather conditions for cloud seeding control. Five LANDSAT Data Collection Platforms were operated during the reporting period and proved to be reliable weather resistant units suitable for the collection of hydrometeorological data from remote, severe winter environments. The data relayed by LANDSAT satellite were available in near real-time for project forecasting. A significant accomplishment toward improving the LANDSAT DCS was the development of a system for averaging wind speed and wind direction data and on-site storage of hourly averaged data. (Sims-ISWS)
W77-02500

USE OF RADAR INFORMATION IN DETERMINING FLASH FLOOD POTENTIAL,
National Weather Service, Garden City, N. Y. Eastern Region.
S. E. Wasserman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 071, Price codes: A02 in paper copy, A01 in microfiche. Technical Memorandum NWS ER-60, December 1975. 10 p, 3 tab, 4 ref.

Descriptors: *Flash floods, *Flood forecasting, *Warning systems, *Radar, Rainfall, Floods, Remote sensing, Precipitation(Atmospheric), Rates, *Excessive precipitation, Measurement, Weather, Runoff, Meteorology, Hydrology.
Identifiers: *Weather radar.

An improved method was designed for the use of radar information by operational people in the flash flood program. Radar estimates of maximum precipitation were compared objectively with the minimum, three-hour precipitation amounts required for flash flooding. Through this comparison, areas that have a potential for flash flooding were determined. Information concerning the minimum rainfall required for flash flooding, called Flash Flood Guidance, was prepared and disseminated daily by River Forecast Centers. (Sims-ISWS)

2C. Snow, Ice, and Frost

ARIZONA'S FROZEN ASSETS: SNOWPACK MANAGEMENT,
Arizona Univ., Tucson. School of Renewable Natural Resources.
D. B. Thorud, and P. F. Ffolliott.
In: 19th Annual Arizona Watershed Symposium Proceedings, Report No. 7, p 31-34, Sept. 1975. 17 ref. OWRT A-045-ARIZ(6).

Descriptors: *Snowpacks, *Snow management, *Arizona, *Melt water, *Forest management, *Surface runoff, Water yield, Water yield improvement, Canopy.
Identifiers: *Runoff efficiency.

Reviews are presented of various snow research projects in Arizona over the past decade to demonstrate possibilities for enhancing snowmelt water yield, especially from forested watersheds. Between 1 1/4 and 2 1/2 million acre-feet of water can be in storage as snowpacks just before snowmelt runoff in early spring; a 10% increase in snowmelt water yields would mean an additional 125,000 to 250,000 acre-feet of water in the state. Research indicates that forest management practices affect the snowpack and cause increased snowmelt runoff; thinning and clearing of forest overstories to increase snowmelt water yield can be made compatible with timber, forage and wildlife production as well as recreational use. Development of forest management guidelines is discussed. Several process and theoretical studies were conducted to determine the relationships between snowpack conditions and forest overstories. Runoff efficiency, defined as the portion of a snowpack which is converted into recoverable surface water, was studied in several watersheds. Efficiencies appear to vary from year to year; however, there is a general trend of low efficiency at the start of a melt season, higher toward the middle, and gradually lower efficiency toward the season's end. (See also W77-02104) (Jahns-Arizona)
W77-02106

ARIZONA'S FROZEN ASSETS: VOLUMETRIC FORECASTS FROM SNOWPACK,
Arizona Water Commission, Phoenix.
E. Kirdar.
19th Annual Arizona Watershed Symposium Proceedings, Report No. 7, p 37-38, Sept. 1975.

Descriptors: *Watershed management, *Arizona, *Snow management, *Snowpacks, *Volumetric analysis, Snowmelt, Runoff, Runoff forecasting, Water resources development, Project planning, Water yield.
Identifiers: *Salt River Valley(Arizona), *Salt River Project, *Volumetric forecasting.

Snowfall is the main form of precipitation from winter storms which account for some 75% of the mean annual runoff in the three major drainage basins of the Salt River Valley in Arizona. About 90% of the total watershed lies below 7000 feet, and snowfall here tends to melt rapidly. Large runoff volumes may result in relatively short periods of time, causing major flooding potential if reservoir storage is high. The aims of the Salt River Project include providing sufficient water for municipal, agricultural and other needs of the valley, insuring reservoir carry-over, maximizing hydroelectric generation during summer months when power demand is high, and minimizing required pumping. The formulation of a Project Reservoir Operating Plan is discussed and the Index Forecast Method of predicting seasonal runoff outlined. Forecasting involves correlations of historical runoff with indices of important determinants of runoff for the area. Seasonal volumetric runoff forecasts are provided using bi-weekly snow survey information from mid-January to April 1. Other watershed information needed for management decisions is also discussed. MEASUREMENTS OF THE TURBULENT BOUNDARY LAYER UNDER PACK ICE,
Washington Univ., Seattle. Dept of Geophysics.
M. G. McPhee, and J. D. Smith.
Journal of Physical Oceanography, Vol. 6, No. 5, p 696-711, September 1976. 17 fig, 7 tab, 23 ref. ONR N-00014-67-0103-0021, ONR N-00014-67-0103-0034.

Descriptors: *Boundary layers, *Turbulence, *Ice cover, Sea ice, Turbulent boundary layers, Model studies, Mathematical models, On-site investigations, Oceans, Currents(Water), Flow, Current meters, Measurement, Friction, Oceanography.

The mean and turbulent flow structure under pack ice was measured during the 1972 AIDJEX pilot study with small mechanical current meter triplets at eight levels in the planetary boundary layer. CTD profiles showed a well-mixed layer of nearly neutral stability to about 35 m, bounded below by a strong pycnocline. The skin friction velocity u* was determined by measuring the Reynolds stress at 2 and 4 m below the ice (beyond the surface layer) and from consideration of other terms in the mean momentum equation. Local pressure gradients and advective acceleration due to topography could not be ignored; when an estimate of the effect was included, u* was 1.0 + or - 0.1 cm/s when the ice velocity relative to the ocean was 24 cm/s. With the proper coordinate transformation, the planetary boundary layer of the ocean resembles that of the atmosphere. Composite averages of non-dimensional Reynolds stress and mean flow in the ocean, when compared with recent models of a neutrally buoyant, horizontally homogeneous atmosphere, fit the model predictions fairly well. However, the lateral component (perpendicular to surface stress) departed markedly from those predictions, indicating that form drag associated with pressure ridge keels is important. Peaks in spectra of vertical velocity were used to estimate eddy viscosity proportional to mixing length at eight levels in the outer layer. Results agreed well with the models, but this eddy viscosity did not provide a simple relation between Reynolds stress and mean flow shear. (Sims-ISWS)

KAISER EFFECT IN SNOW,
Montana State Univ., Bozeman.
C. C. Bradley, and W. St. Lawrence.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A022 528, Price codes: A02 in paper copy, A01 in

microfiche. Report ARO 11042.4-EN, 1975. Reprint from the Proceedings of the Grindelwald Symposium on Snow Mechanics held April 1974. IAHS-AISH publication No. 114, p 145-154, 1975. 5 fig, 3 ref. Army DA-ARO-D-31-124-73-G175.

Descriptors: *Snow, *Stress, *Sounds, Laboratory tests, Physical properties, Tension, Pressure, Loads(Forces), Graphical analysis, Mechanics.
Identifiers: *Kaiser effect(Snow).

Acoustical signals emanating from stressed snow indicated that snow, in common with other crystalline materials, exhibits Kaiser effect or 'memory' of previous stress. This memory can be quite specific as to the magnitude of the prestress. It also appears to be usable for identifying the mode of the prestress (compressive or tensile). These conclusions were drawn from laboratory experiments in which dimensioned snow columns were subjected to uniaxial dead loads both in compression and in tension, and then restressed after relaxation periods. Experiments on the longevity of the memory function indicated that most of the decay takes place in the first 6 h, but that it is still detectable after relaxation periods of up to 24 h. (Sims-ISWS)

WATER FLOW IN GLACIERS: JOKULHLAUPS, TUNNELS AND VEINS,
Bristol Univ. (England). H. H. Wills Physics Lab.
J. F. Nye.
Journal of Glaciology, Vol. 17, No. 76, p 181-207, 1976. 13 fig, 1 tab, 25 ref, 3 append.

Descriptors: *Glaciers, *Melt water, *Lakes, *Blowouts, Flow, Water, Tunnels, Glaciology, Ice, Theoretical analysis, Thermodynamic behavior, Heat transfer, Floods, Melting, Equations.
Identifiers: *Iceland, *Lake Grimsvotn, Ice-dammed lake, *Jokulhlaups.

The physics of water flow within and under glacier ice was examined with special reference to the periodic catastrophic outbursts of water (jokulhlaups) from the subglacial lake Grimsvotn, Vatnajokull, Iceland. The lake is sealed until it reaches a critical level which enables it to lift the glacier helped by a hydrostatic cantilever effect. The differential equations for non-steady water flow in a subglacial tunnel were derived and applied to the 1972 Grimsvotn outburst. The discharge time relation observed during the growth stage and the abrupt ending of the flood were both very well accounted for by a theory which is insensitive to the details of the subglacial tunnel system. The steady state, in which an intergranular vein or tunnel is simultaneously melted open by frictional heat and closed by plastic deformation, may be stable or unstable according to the conditions imposed at the ends. This explains why the flow of water in a vein does not normally increase unstably as in a jokulhlaup. An ice-dammed lake does not drain away through the vein system because the driving force on the vein-water is towards the lake rather than away from it. (Humphreys-ISWS)

THE EFFECT OF SUBGLACIAL CHEMICAL PROCESSES ON GLACIER SLIDING,
California Univ., Los Angeles. Dept. of Geology.
B. Hallet.
Journal of Glaciology, Vol. 17, No. 76, p 209-221, 1976. 4 fig, 17 ref, 1 append. NSF GA 40497X.

Descriptors: *Glaciers; *Ice, *Ice-water interfaces, Movement, Glaciology, Temperate, Subarctic, Theoretical analysis, Surfaces, Boundaries(Surfaces), Velocity, Equations, Freezing, Melting.
Identifiers: *Glacier sliding, Chemical processes, Chemical deposits.

The glacier sliding theory of Nye was modified to include the effect of solutes in subglacial regelation waters on the sliding process. Motivation for this development stems from studies of subglacially formed chemical deposits that appear to be widespread on rock surfaces recently exposed by retreating temperate glaciers. These deposits indicate clearly that considerable local concentration of solutes commonly occurs subglacially as a result of the selective rejection of solutes into the melt during the freezing associated with regelation sliding. Because solutes accumulate where regelation waters refreeze, they tend to lower the temperature there and, hence, inhibit the heat transport away from these areas which is essential for regelation sliding. For a simple sinusoidal bed and solute distribution in the regelation water film, the modified theory showed that a maximum excess of solutes of, for example, several millimoles/l of dissolved CaC03 along lee surfaces relative to stoss surfaces impedes basal sliding significantly, especially if the bed roughness wavelength does not exceed approximately one meter. THE BEARING CAPACITY OF FLOATING ICE PLATES SUBJECTED TO STATIC OR QUASI-STATIC LOADS,
Princeton Univ., N. J. Dept. of Civil Engineering.
A. D. Kerr.
Journal of Glaciology, Vol. 17, No. 76, p 229-268, 1976. 28 fig, 3 tab, 153 ref.

Descriptors: *Reviews, *Ice, *Mechanical properties, *Strength of materials, Publications, Documentation, Ice loads, Loads(Forces), Ice cover, Elasticity(Mechanical), Plasticity, Shear, Bearing strength, Flexibility, Load distribution, Analytical techniques, On-site tests, Laboratory tests, Analysis, Equations, Bibliographies.
Identifiers: Floating ice plates.

This paper reported a critical survey of the literature on the bearing capacity of floating ice plates. The report consisted of a discussion of general questions, a critical survey of analytical attempts to determine the bearing capacity of floating ice plates, and a survey of field and laboratory tests on floating ice plates and their relation to the analytical results. It concluded with a systematic summary of the results, a discussion of observed shortcomings, and suggestions for needed investigations. (Humphreys-ISWS)

THE APPLICATION OF FRACTURE MECHANICS TO THE PROBLEM OF CREVASSE PENETRATION,
Cambridge Univ., (England). Dept. of Engineering.
R. A. Smith.
Journal of Glaciology, Vol. 17, No. 76, p 223-228, 1976. 4 fig, 7 ref.

Descriptors: *Glaciers, *Cracks, *Model studies, *Ice, Mathematical models, Theoretical analysis, Failure(Mechanics), Rupturing, Depth.
Identifiers: *Crevasses.

The elastic stress intensity factor is a paramter used in fracture mechanics to describe stress conditions in the vicinity of the tip of a sharp crack. By superimposing solutions of stress intensity factors for different loading conditions, equations were derived which model crevasses in ice. Solutions were presented for the theoretical depth of isolated crevasses, free from or partially filled with water. Close agreement existed with a previous calculation by Weertman using a different technique. The effect of crevasse spacing was investigated. It was demonstrated that closer spacing always reduces crevasse depth, but, over a wide range of spacing, the predicted variation in depth is slight. (Humphreys-ISWS) (See also W74-09335)

MEASUREMENTS OF ACOUSTIC PROPERTIES OF HARD-PACK SNOW,
Montana State Univ., Bozeman. Dept. of Civil Engineering and Engineering Mechanics.
T. E. Lang.
Journal of Glaciology, Vol. 17, No. 76, p 269-276, 1976. 8 fig, 1 tab, 5 ref. NSF GA-3943, DA-ARO-D-31-124-71-G59.

Descriptors: *Snowpacks, *Acoustics, *Sound waves, Snow, Physical properties, *Measurement, On-site tests, Laboratory tests, Equipment, Analysis, Frequency.

Three experiments were conducted to assess acoustic properties of hard-pack snow. One test involved transmission of acoustic signals in the frequency range 100-20,000 Hz through natural snowpack in order to measure signal loss of a point acoustic source. It was found that at all frequencies, the relatively high-energy input signal decays rapidly by energy dissipation, with nominal dissusion occurring at large distances from the source. Signal persistence is greatest in the frequency range 100-200 Hz. In a second test, acoustic bursts in snow columns under deformation were recorded. Spectrum analysis in the frequency range 500-14,000 Hz revealed dominance of signal amplitudes at frequencies between 1000 and 10,000 Hz. This dominance was attributed to the strong attenuation properties of snow and suggests the use of waveguide or collector techniques to monitor natural acoustic emissions in snowpack. In a third test, several waveguide geometries and materials were evaluated for their acoustic signal interception and transmission characteristics. In general, metallic waveguides show the least attenuation of the configurations tested. (Humphreys-ISWS)

SNOW PRESSURE ON RIGID OBSTACLES,
Washington Univ., Seattle. Geophysics Program.
D. McClung.
Journal of Glaciology, Vol. 17, No. 76, p 277-285, 1976. 8 fig, 8 ref.

Descriptors: *Snow, *Load distribution, *Physical properties, Pressure, Loads(Forces), Viscous flow, Movement, Analysis, Theoretical analysis, Dynamics, Drag, Deformation, Snowpacks.
Identifiers: Retaining structures.

A continuum mechanical formulation of snow pressure was given. The snow pressure against retaining structures on slopes was considered in two separate parts: (1) the static component due to the regression of transverse expansion, and (2) the dynamic component due to the interruption of the creep (internal deformation) and glide (slip of the entire snow cover over the ground). Snow pressure calculations made using non-linear viscous constitutive equations were given for the plane

strain-rate problem of a rigid barrier on a snow-covered slope. These calculations were compared with the previous formulation of snow pressure given by Haefeli for the expected range of boundary conditions for the structure and for the snow-earth interface. The results showed that the original formulation by Haefeli gives a dynamic component of similar magnitude to the present calculations. Substantial differences were apparent when the up-slope distances for interruption of the creep and glide processes were compared. Any slope geometry, barrier geometry, distribution of density, and distribution of ground roughness are easily incorporated into the calculations. (Humphreys-ISWS)

THE ORIGIN OF GLACIALLY FLUTED SURFACES - OBSERVATIONS AND THEORY,
University of East Anglia, Norwich (England). School of Environmental Sciences.
G. S. Boulton.
Journal of Glaciology, Vol. 17, No. 76, p 287-309, 1976. 18 fig, 17 ref.

Descriptors: *Glaciology, *Geomorphology, *On-site investigations, Ice, Movement, Till, Glaciers, Cirques, Topography, Shape, Theoretical analysis, Boulders.
Identifiers: *Alps, *Flutes, *Iceland, *Spitsbergen, *Norway, Subglacial, Flute formation.

Studies of fluted surfaces beyond the margins of glaciers in Spitsbergen, Iceland, Norway, and the Alps show that almost all fluted surfaces emanate from rigid obstructions, commonly boulders in till. Field relations of flutes were described, and it was shown that a relationship exists between flute height and the height of the initiating obstruction. Subglacial observations indicated that flutes form when till is intruded into tunnels which tend to open up in the lee of obstacles. The pattern of strain implied by this process was shown to be reflected by micro- and macro-fabrics in the till. The commonly found occurrence of an average spacing between flutes does not arise because of some rhythmic or periodic mechanism in the glacier but is produced by the random seeding of boulders which themselves generate flutes. It was suggested that the term 'flute' be used as a genetic rather than a descriptive term and be restricted to long parallel-sided ridges which reflect accurately the direction of ice movement and which form when deformable subglacial materials are intruded into tunnels which tend to open up on the lee sides of single rigid obstructions on the glacier bed. (Humphreys-ISWS)

A THEORETICAL ANALYSIS OF THE FORMATION OF GLACIAL FLUTES,
University of East Anglia, Norwich (England). School of Environmental Sciences.
E. M. Morris, and L. W. Morland.
Journal of Glaciology, Vol. 17, No. 76, p 311-323, 1976. 5 fig, 1 tab, 20 ref.

Descriptors: *Glaciology, *Geomorphology, *Ice, Movement, Till, Glaciers, Cirques, Theoretical analysis, Topography, Shape, Equations, Mathematical studies, Glacial sediments.
Identifiers: *Flutes, *Iceland, *Flute formation.

In an analysis of the formation of flutes by subglacial cavities, the flute-forming sediment was treated as a linear isotropic elastic material prior to failure, which occurs when Coulomb's law is satisfied. The maximum height of a flute was derived as a function of the mechanical properties of its material, and the factors controlling the variation of height with distance along the flute were analyzed. The flow pattern of material during the formation of a flute which the theory suggests was similar to the patterns which have been determined in a till fabric analysis of flutes near Breioamerkurjokull, Iceland. CLIMATIC INFERENCES FROM FORMER GLACIERS IN THE SOUTH-EAST GRAMPIAN HIGHLANDS, SCOTLAND,
Edinburgh Univ., (Scotland). Dept. of Geography.
J. B. Sissons, and D. G. Sutherland.
Journal of Glaciology, Vol. 17, No. 76, p 325-346, 1976. 4 fig, 7 tab, 34 ref.

Descriptors: *Glaciers, *Climatology, *Precipitation(Atmospheric), Firn, Glaciation, Ablation, Albedo, Glaciology, Geomorphology, Snow, Snowfall, Temperature, Solar radiation, Quaternary period, Climatic data, Analysis, Foreign countries.
Identifiers: *Scotland, *Younger Dryas.

Altitudes, lengths, areas, maximum thicknesses, and volumes of 27 glaciers that built up in a small area of the Scottish Highlands during the Loch Lomond (Younger Dryas) stadial were given. The influence of direct radiation on the glaciers was calculated taking into account transmissivity of the atmosphere, glacier aspect and surface gradient, and the albedos of ice and snow. Equilibrium firn lines for the glaciers were determined. The computed regional firn line, incorporating the influence of direct radiation, had a gradient of 14.5 m/km. Former precipitation values were based on an equation for average annual mass balances of the glaciers during the stadial that incorporates glacier altitude, regional ablation gradient, direct radiation, the influence of avalanching and blowing of snow, and final glacier volume. Average July and January sea-level temperatures of 6C and at least -8C, respectively, were inferred. Snowfall was principally associated with south-east winds and was similar in total to present day but rather differently distributed. Cloud amounts, at least in summer, were greater than now. A more vigorous atmospheric circulation with many depressions moving along more southerly tracks than now may have been related to the junction of polar water and North Atlantic Drift water in the immediate vicinity of the British Isles. (Humphreys-ISWS)

AUTOMATED SEISMIC MONITORING SYSTEM FOR LAKE MICHIGAN ICE STUDIES,
Wisconsin Univ., Milwaukee. Dept. of Geological Sciences.
R. W. Taylor, J. P. Kovach, and N. P. Lasca.
Journal of Glaciology, Vol. 17, No. 76, p 347-350, 1976. 2 fig, 1 ref. NSF KG-41011.

Descriptors: *Lake ice, *Lake Michigan, *Data processing, *Seismic properties, Seismic waves, Instrumentation, Ice, Data storage and retrieval, Monitoring, Basic data collections, Automation.

A simple, relatively inexpensive system for signal recovery in retrospect was designed to record lake-ice seismic events. The system is broad-band, D.C. to 100 Hz, light-weight and may be added to any existing data-acquisition equipment. The system may be used (1) to initiate high speed paper recordings in the field, (2) to store transient events on magnetic tape while in the field, or (3) for the unattended laboratory-recovery of transient events from a continuous field recording. Continuous, high resolution, broad-band recordings of seismic events occurring in lake ice over a period of weeks may be stored on a single reel of magnetic tape. The initial cost of the device is rapidly equaled by the savings in tape cost and man hours expended in signal recovery. (Humphreys-ISWS)
W77-02468

A NOTE ON THE CONTRIBUTION OF RIME AND SURFACE HOAR TO THE ACCUMULATION ON THE ROSS ICE SHELF, ANTARCTICA,
Nevada Univ., Reno. Desert Research Inst.
G. O. Linkletter, and J. A. Warburton.
Journal of Glaciology, Vol. 17, No. 76, p 351-354, 1976. 1 fig, 1 tab, 14 ref. NSF OPP73-05843-A01.

Descriptors: *Antarctic, *Ice, *On-site investigations, *Fog, Frost, Snow, Snow packs, Snow surveys, Rime, Surfaces.
Identifiers: *Ross Ice Shelf.

Observations and measurements made on the Ross Ice Shelf during 1974 suggested that rime and surface hoar deposited on the surface during fogs may contribute 5-10% of the annual accumulation. Layers formed during such fogs may be mistaken for depth hoar layers in the snow-pack. (Humphreys-ISWS)

A CONCISE METHOD FOR ANALYZING THE ICE-MELTING PERFORMANCE OF A HEATED DISC,
Sun Oil Co., Richardson, Tex. Science and Technology Div.
J. F. Lea.
Journal of Glaciology, Vol. 17, No. 76, p 355-358, 1976. 1 fig, 2 ref.

Descriptors: *Ice, *Melting, *Mathematical studies, Heat transfer, Temperature, Theoretical analysis, Equations, Analytical techniques, Mathematics, Numerical analysis.
Identifiers: *Heated disc.

Shreve (1962) evaluated the performance of solid-nose hotpoints of various geometries. A more concise method for analysis of the special case of a flat disc melting into ice was presented. In contrast to the numerical solution presented by Shreve, this method resulted in a closed analytical solution, based on constant properties, which is corrected using a property ratio scheme. This technique allowed the substitution of various fluid properties into the solutions as might be required when considering contaminated or saline ice or other liquids. Shreve's method would require some additional numerical work to evaluate various properties because the temperature dependence of the viscosity of water is integrated into the results. Results obtained for the flat disc using this method were shown to compare favorably with Shreve's indicating that this type of analysis may be applicable to other meltunit geometries. (Humphreys-ISWS)

ICE MOVEMENT AND DISTRIBUTION IN THE BERING SEA FROM MARCH TO JUNE 1974,
Alaska Univ., College. Inst. of Marine Science.
R. D. Muench, and K. Ahlnas.
Journal of Geophysical Research, Vol. 81, No. 24, p 4467-4476, August 20, 1976. 12 fig, 1 tab, 14 ref. NOAA 5-35190.

Descriptors: *Sea ice, *Ice cover, Movement, *Distribution, Winds, Surveys, Remote sensing, Satellites(Artificial), Distribution patterns, Heat transfer, Ice, Circulation, Water circulation, Oceanography.
Identifiers: *Bering Sea, *Ice movement.

Ice distribution and motion in the Bering Sea from March to June 1974 were observed by imagery from the NOAA 2 and 3 VHRR (very high resolution radiometer) satellites. The southerly ice edge was nearly constant in position from Marsch to mid-May, when ice disintegration had progressed to a point where the edge was undefined. Ice movement was southerly in response to northerly winds until late April, after which variable ice motion reflected variable winds. The southerly motion created regions of ice divergence south of islands and along east-west trending southern coasts. In some areas such as the Bering Strait, water motion exerted sufficient stress on the ice to balance the wind stress, resulting in stationary ice of northerly ice motion. The Bering Sea ice cover is conceptualized as northern source and southern

sink regions connected by an intermediate zone of southerly ice motion. A mean observed southerly ice motion of 18 cm/s requires heat losses for ice formation of the order of 10 g-cal/sq m/s or an order of magnitude greater if most ice is assumed to form in divergent areas covered by thin ice or that have open water. These values are in agreement with previous estimates of sea-air heat flux in the Arctic. (Sims-ISWS)

AN OPERATIONAL APPLICATION OF SATELLITE SNOW COVER OBSERVATIONS - NORTHWEST UNITED STATES,
Bonneville Power Administration, Portland, Oreg.
J. P. Dillard.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-16599, Price Codes: A02 in paper copy, A01 in microfiche. Report NASA CR-144723, November 1975. 32 p, 2 fig, 3 tab, 3 ref, 1 append. NASA S-53877.

Descriptors: *Remote sensing, *Snow cover, *Pacific northwest U.S., *Satellites(Artificial), Surveys, Mapping, Water resources, Snow, Precipitation(Atmospheric), Snowmelt, Runoff, Snow surveys, Aircraft, Watersheds(Basins), Rivers, Water levels, Hydroelectric power, Powerplants.
Identifiers: *LANDSAT.

LANDSAT-1 imagery showing extent of snow cover was collected for the 1973 and 1974 snowmelt seasons for the following Columbia River Basins: North Santiam River Basin above Detroit Dam, Oregon; Upper Snake River Basin above Palisades Dam, Idaho; and Boise River Basin above Lucky Peak Dam, Idaho. The primary objective of this study was to map snowlines and determine the aerial snow cover using satellite data. A secondary objective was to compare satellite snow mapping products to products from conventional information sources. A long-term objective was to develop or to modify methods in an operational mode to incorporate satellite-derived snow cover data to improve runoff forecasting techniques. Available satellite data were successfully analyzed by radiance thresholding to determine snowlines and the attendant snow-covered area. Conventional data sources were used to verify the data obtained from satellite imagery. A computer model capable of reconstituting streamflow was one such source used for this verification. Verification of the LANDSAT-1 data was generally good, although there were exceptions. Two major problems were (1) a lack of adequate cloud-free satellite imagery of high resolution, and (2) need for a way to determine snowlines in forested areas. (Sims-ISWS)

RELATIVE IMPORTANCE OF SOIL RESISTANCE AND PLANT RESISTANCE IN ROOT WATER ABSORPTION,
Agricultural Research Service, Florence, S. C. Southern Region.
D. C. Reicosky, and J. T. Ritchie.
Soil Science Society of America Journal, Vol. 40, No. 2, p 293-297, March-April, 1976. 3 fig, 1 tab, 32 ref.

Descriptors: *Soil-water-plant relationships, *Moisture uptake, *Soil water, *Transpiration, Water loss, Leaves, Corn, Sorghum, Nutrients, Root zone, Absorption, Sands, Soil types, Clays, Hydraulic conductivity.

The relative importance of soil and plant resistances and their influence on leaf water potential and transpiration over a range of measured hydraulic conductivities and matric potentials commonly encountered in Varina sandy loam and Houston Black Clay was evaluated. Experiments were conducted on corn grown in a greenhouse and sorghum grown in a field. Soil water potentials, leaf water potentials, and transpiration rates were determined to evaluate the magnitude of the combined soil and plant resistances to water flow in the plant system. Results show that when root density was not unusually low, plant resistance to water transport was much larger than soil resistance until a higher threshold soil hydraulic conductivity was reached. These findings emphasize the need to consider plant resistance in moisture uptake calculations when using equations that evaluate water potential gradients along the water flow path. (Jamail-Arizona)

WATER FLOW IN WHEAT SEEDLINGS AFTER SMALL WATER DEFICITS,
Lund Univ. (Sweden). Dept. of Plant Physiology.
A. Nordin.
Physiologia Plantarum, Vol. 37, No. 2, p 157-162, 1976. 7 fig, 2 tab, 19 ref.

Descriptors: *Moisture stress, *Moisture uptake, *Moisture deficit, *Moisture content, *Moisture availability, Root zone, Root systems, Stress, Wheat, Transpiration, Hygrometry, Moisture meters, Leaves, Stomata, Conductivity, Ion transport, Water balance.

The after-effects of slightly increased leaf water deficits on water flow through wheat seedlings are discussed. Transpiration and water uptake were measured simultaneously using a micro-wave hygrometer and a recording potometer. It is known that water deficits can be achieved by cooling the roots while the shoots are subject to conditions for high transpiration rate. An experiment was conducted to find out if root cooling without accompanying leaf stress, will induce changes in water flow. Wheat seedlings were kept with the roots at one degree centrigrade in nutrient solution and the shoots in air at 20 degrees centigrade for 24 hours. This treatment induced a 2 percent decrease in relative water content of the leaves which rapidly disappeared after a return to normal root temperatures. The magnitude of the after-effects varied with leaf water content, though some contribution of root cooling to the after-effects cannot be excluded. The decreased water flow through the plant after removal of stress can be attributed mainly to increased stomatal resistance and not to effects on root conductivity. The increased stomatal resistance appears linked to increased membrane permeability rather than to a decrease in the active mechanism for ion uptake. (Jamail-Arizona)

SENSITIVITY AND MODEL VARIANCE ANALYSIS APPLIED TO SOME EVAPORATION AND EVAPORTRANSPIRATION MODELS,
Agricultural Research Service, Chickasha, Okla.
G. Coleman, and D. G. DeCoursey.
Water Resources Research, Vol. 12, No. 5, p 873-879, October 1976. 2 fig, 2 tab, 16 ref.

Descriptors: *Analytical techniques, *Mathematical models, Forecasting, *Evaporation, *Evapotranspiration, Model studies.
Identifiers: *Sensitivity analysis, *Error variance analysis, Finite difference.

Variable sensitivity and error variance of six evaporation and evapotranspiration models were calculated. Their sensitivity values were computed by approximating the partial derivatives by finite differences. To compare the models, relative sensitivity was computed as the percent change in evaporation per unit change in the input variable. A second relative sensitivity was calculated to compare the relative importance of the different input variables. Error variance was analyzed to find the variance of error due to instrument inaccuracies using instrument variance estimated from the manufacturer's statements. Although no tests were conducted to determine the bias or prediction accuracy of the model, a technique was proposed to show how the instrument error variance could be added to the prediction error variance to determine the overall system variance. In model development the best model will be one whose sum of these two variances is a minimum if there is no prediction bias.

PATTERNS OF LEAF RESISTANCE TO LODGEPOLE PINE TRANSPIRATION IN WYOMING,
Wyoming Univ., Laramie. Dept. of Botany.
N. Fetcher
Ecology, Vol. 57, No. 2, p 339-345, Early Spring 1976. 4 fig, 27 ref. OWRT A-011-WYO(1). 14-31-0001-3551, 3851, 4051, 5051.

Descriptors: *Conifers, *Stomata, *Transpiration, *Lodgepole pine trees, *Wyoming.
Identifiers: *Leaf resistance, Mountain watersheds, Stomatal behavior, Water potential.

Leaf resistance of lodgepole pine was measured with an aspirated porometer at three sites in the Medicine Bow Mountains, Wyoming. In the early part of the growing season all the sites had low leaf resistance (3-5 s/cm) and few significant changes in leaf resistance during the day. Towards the end of the growing season, in August, significant increases in midday leaf resistance occurred at all sites. The greatest increase (to 57 s/cm) was found on the driest site. Smaller increases (to 10-14 s/cm) were measured at a dry-mesic site and a mesic site. The results indicate that stomatal control of transpiration is more important towards the end of the growing season and that the degree of control varies with the soil water regime of the site. The response to soil water status appears to be nonlinear. When base pressure potential readings were above an upper threshold, leaf resistance did not increase during the day. Below a lower threshold it increased significantly. Between the two thresholds, changes in leaf resistance under high light conditions are explained more readily by the interaction between vapor pressure deficit and soil water status than by either factor alone.

EVAPOTRANSPIRATION MODEL TESTED FOR SOYBEAN AND SORGHUM,
Kansas State Univ., Manhattan. Dept. of Agronomy.
E. T. Kanemasu, L. R. Stone, and W. L. Powers.
Agronomy JOurnal, Vol. 68, No. 4, p 569-572, July-August 1976. 3 fig, 3 tab, 13 ref. OWRT A-056-KAN(3).

Descriptors: *Evapotranspiration, *Sorghum, *Soybeans, *Model studies, Evaporation, Transpiration, Advection, Stomata, Lysimeters, Temperature, Soil moisture, Soil water movement, Solar radiation.
Identifiers: Stomatal resistance, Leaf area index.

Daily evapotranspiration estimated using a new model applied to sorghum and soybeans was within 2 mm of estimates by lysimetric observation. The model employs daily inputs of temperature, solar radiation and leaf area index; outputs include transpiration and evaporation. The model has potential in scheduling irrigation on a routine basis. Seasonal evaporation accounted for 15 to 20% of the evapotranspiration which was about 10% greater from soybeans than from sorghum. Nightime evapotranspiration losses (lysimetric) from soybeans were also 1.8 times greater, indicating lower stomatal resistance. Leaf area indices indicated a greater surface resistance for sorghum. SYNTHETIC DESIGN HYETOGRAPH AND RATIONAL RUNOFF COEFFICIENT,
American Consulting Services, Inc., Minneapolis, Minn. Environmental Engineering.
J-S. Chien, and S. Sarikelle.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol. 102, No. IR3, Proceedings Paper 12375, p 307-315, September 1976. 3 fig, 3 tab, 11 ref, 2 append.

Descriptors: *Urban hydrology, *Hydrographs, *Hyetographs, *Rainfall intensity, Rational formula, Runoff coefficient, Urban runoff, Hydrology, Rainfall, Drainage, Time of concentration, Storms.
Identifiers: *Synthetic hyetograph, *Rational runoff coefficient, Average runoff coefficient.

A simple method of establishing the synthetic design hyetograph was presented. The method was based on rainfall intensity-duration-frequency curves with simple computation. The method incorporated the rainfall duration, rainfall depth, and the advancing storm patterns. In addition, a method of computing the average runoff coefficient for the Rational Method was developed. This method was predicated on the principle of mass conservation using Horner's field data. Examples were given for the establishment of synthetic design hyetograph and its application to the determination of average runoff coefficient. The methods presented were useful tools for drainage analysis. (Lee-ISWS)

FLOW RECESSION IN THE EPHEMERAL STREAM,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
R. W. Peebles.
Ph.D. Dissertation, 1975. 88 p, 13 fig, 4 tab, 11 ref.

Descriptors: *Streamflow, *Recession curves, *Ephemeral streams, *Hydraulic models, Model studies, Hydrographs, Discharge(Water), Stage-discharge relations, Streamflow forecasting, Equations, Continuity equation, Reservoir leakage, *Arizona.
Identifiers: *Walnut Gulch Experimental Watershed(Ariz), Pantano Wash(Ariz).

The flow recession portion of the ephemeral stream flood hydrograph is modeled as a conceptual analog of the discharge from a leaky reservoir. This model may be used where flow data is absent and as an operational tool. The reservoir approximates physically the portion of the ephemeral stream channel that is flowing at the start of recession. The reservoir model is described by a continuity equation, a discharge-stage relation (rating) and a storage-stage relation that conveys reservoir shape. A good agreement between observed and model curves is achieved by optimizing reservoir leakage rate and initial storage and is most sensitive to changes in initial storage. Streamflow records used in the study are from the Walnut Gulch Experimental Watershed and Pantano Wash, both in Arizona. The best parameter values are physically realistic; the best reservoir configuration has leakage that varies directly with stage (depth) and storage that varies as the square of the stage. Results suggest that a characteristic shape may exist for recession at a point on the stream (Jahns-Arizona)

D. A. Rickert, W. G. Hines, and S. W. McKenzie.
Available from Branch of Distribution, USGS, 1200 S. Eads St., Arlington, Va., 22202. Circular 715-C, 1976. 31 p, 7 fig, 3 tab, 43 ref.

Descriptors: *Water quality, *Project planning, *Rivers, *Oregon, Evaluation, Methodology, Water quality control, Model studies, Land development, Environmental effects, Water pollution sources, Trace elements, Bottom sediments, Algae, Dissolved oxygen, Erosion.
Identifiers: *Willamette River(Oreg).

The U. S. Geological Survey recently (1976) completed an intensive river-quality assessment in the Willamette River basin, Oregon. This circular covers aspects of overall project development and methods and data programs used to assess four river-quality problems. The assessed problems were (1) the effect of population and industrial growth and resulting waste discharges on dissolved oxygen, (2) the potentially harmful effects on land and river quality of accelerated erosion resulting from intensified land use, (3) the potential for nuisance algal growths, and (4) the possibility of trace-metal accumulation in river-bottom sediments. Described are the approaches and rationales used to organize the project, to select and formulate the assessment methods, and to design the data programs. (Woodard-USGS)

TRANSVERSE MIXING IN NATURAL CHANNELS,
Geological Survey, Reston, Va. Water Resources Div.
N. Yoksukura, and W. W. Sayre.
Water Resources Research, Vol 12, No 4, p 695-704, August 1976. 8 fig, 25 ref.

Descriptors: *Diffusion, *Solutes, *Natural streams, *Steady flow, *Mathematical models, Forecasting, Water quality, Equations, Natural flow, Channel flow, *Mixing, Meanders, Evaluation, Data collections.
Identifiers: *Transverse mixing.

A mathematical model is presented for predicting the steady state two-dimensional distribution of solute concentration in a meandering nonuniform natural channel. Two features of the convection-diffusion (mixing) equation derived are that it employs the transverse cumulative discharge as an independent variable replacing the transverse distance and that it is developed in an orthogonal curvilinear (natural) coordinate system which follows the general direction of the channel flow. The transformed mixing equation unifies and generalizes essential concepts of several existing models which have been used successfully for simulating steady state transverse mixing in irregular natural channels. Solution methods, both analytical and numerical, and parameter estimation methods are presented. Results of simulation are compared with observed data. (Woodard-USGS)

COMPARISON OF LINEAR SYSTEMS AND FINITE DIFFERENCE FLOW-ROUTING TECHNIQUES,
Geological Survey, Jackson, Miss. Water Resources Div.
T. N. Keefer.
Water Resources Research, Vol 12, No 5, p 997-1006, October 1976. 10 fig, 13 ref.

Descriptors: *Streamflow forecasting, *Model studies, *Flow characteristics, Routing, *Finite element analysis, Evaluation, *Linear programming, Systems analysis.

Identifiers: Streamflow model comparison, *Finite difference method.

A single-input linear system model and a multiple-input linear system model are compared to a finite difference model. Comparisons are based on the ability of the models to predict discharge at the downstream end of a 24.14-km reach of prismatic channel. Four types of channels and two slopes covering a wide range of conditions are evaluated. The single-input model compares favorably in cases where flood wave celerity does not vary greatly with discharge. The multiple-input model can be made to compare favorably in all cases. Linear model parameters cannot be set accurately without calibration, except in the case of rectangular channels. The single-input model is approximately one sixth as costly as the finite difference model, and the multiple-input model is approximately one half as costly for the conditions investigated. GEOPHYSICAL STUDY OF THE WATERBEARING STRATA IN BITTERROOT VALLEY, MONTANA,
Montana Univ., Missoula. Dept of Geology.
G. W. Crosby.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 390, Price codes: A05 in paper copy, A01 in microfiche. Montana University Joint Water Resources Research Center, Bozeman, Report No. 80, September 1976. 68 p, 23 fig, 3 tab, 52 ref. OWRT A-063-MONT(1). OWRT 14-31-0001-4026.

Descriptors: *Hydrogeology, *Groundwater resources, Magnetic studies, Seismic studies, *Subsurface mapping, *Montana, Model studies.
Identifiers: *Bitterroot Valley(Mont), *Bouguer anomaly, Ambrose Creek area(Mont).

A map of the complete Bouguer anomaly for the Bitterroot Valley in Western Montana is produced and interpreted to yield the general geometry of Cenozoic valley fill sediments. Various steps in processing the gravity data are discussed including lowpass, frequency domain filtering and two and three dimensional modeling. Refraction and reflection seismic data are analyzed for the area north of Stevensville to verify the models generated from the gravity data and to investigate the possibility of using seismic methods to gain meaningful data for ground water prospecting. A map of the total magnetic intensity is presented for the area north of Stevensville. Depth estimates based upon the magnetic data indicate anomalies originating from several levels in the subsurface in the vicinity of Ambrose Creek. Three dimensional modeling of the magnetic field verified the existence of a multilayer anomalous body. Results indicate the existence of a continuous surface which extends from the eastern face of the Bitterroot Range and intersects the anomalous magnetic body in the Ambrose Creek area. Punjab Agricultural University, Ludhiana (India). Dept. of Soil and Water Engineering
S. R. Singh, and C. M. Jacob.
Journal of the Engineering Mechanics Division, American Society of Civil Engineers, Vol. 102, No. EM5, Proceedings Paper 12463, p 807-824, October 1976. 4 fig, 24 ref, 2 append

Descriptors: *Aquifers, *Groundwater, *Mathematical models, *Numerical analysis, Water resources, Analytical techniques, Seepage, Hydrology, Equations, Model studies, Flow
Identifiers: *Boussinesq equation, Travel waves, Crank-Nicolson finite difference scheme, Phreatic aquifer.

The Boussinesq equation is a mathematical model of unconfined groundwater flow. Since the equation is nonlinear, finite difference methods offer a possible technique for solutions. In this study, an extrapolated Crank-Nicolson finite difference scheme for one-dimensional Boussinesq equation with source and sink terms was described to model the flow through a phreatic aquifer lying between two open channels. Generalized traveling wave solutions of the same equation were also obtained A comparison of the extrapolated Crank-Nicolson solution with a traveling wave solution confirmed the accuracy of the former. Details of the response of an unconfined aquifer subject to different rates of recharge and withdrawal were presented. (Lee-ISWS)

San Jose State Univ., Calif.
R. Singh.
Water Resources Research, Vol. 12, No. 4, p 775-780, August 1976. 8 fig, 17 ref. NSF GK-18526.

Descriptors: *Groundwater recharge, *Unsteady flow, *Laplaces equation, Recharge, Mathematical studies, Water table, Porous media, Dimensional analysis, Analysis, Computers, Groundwater, Graphical analysis, Equations.
Identifiers: *Finite difference analysis, Boundary conditions.

Design of recharge facilities close to urban centers requires determination of the transient water table in the vicinity of the recharge site. This involves solution of the Laplace equation subject to appropriate boundary and initial conditions which are nonlinear and extremely complex for a phreatic surface with or without accretion. Previous solutions have been obtained either by linearization of the phreatic surface conditions or by utilization of other simplifying assumptions. These solutions are usually inapplicable in regions with steep hydraulic gradients. A technique for computing the transient location of the water table under finite width longitudinal and circular recharge basins was developed. The technique avoided limiting assumptions and linearization. The computations were carried out on a digital computer. Results were presented graphically and compared with other solutions where appropriate. (Adams-ISWS)

THE DETERMINATION OF SEASONAL VARIATIONS IN GROUNDWATER RECHARGE BY DEUTERIUM AND OXYGEN-18 ANALYSIS FOR THE TUCSON BASIN, ARIZONA,
Arizona Univ., Tucson. Dept. of Geosciences.
R. S. White
Master of Science Thesis, 1976. 45 p, 10 fig, 4 tab, 40 ref, 2 append

Descriptors: *Isotope studies, *Deuterium, *Groundwater recharge, *Water management(Applied), *Oxygen isotopes, Recharge, Aquifers, Seepage, Natural recharge, Subsurface waters, Water shortage, Precipitation(Atmospheric), Rainfall, *Arizona, Semiarid climates, Seasonal.
Identifiers: *Tucson Basin(Ariz)

A study was conducted to develop a method for determining the source of groundwater recharge in the Tucson Basin, in southern Arizona. Once these source areas have been defined, isotopic analysis of the water now in storage can help determine whether winter or summer precipitation is more important toward recharge, thus facilitating water management. Paths of recharge were traced by using oxygen-18 and deuterium. It was found that deuterium and oxygen-18 have a distinct differentiation between summer and winter sequences of rain, with the summer precipitation being enriched in deuterium and oxygen-18, due mostly to evaporation fractionation. This distinctive characteristic of the precipitation should help make the identification of recharge areas and recharge paths throughout the basin possible (Jamail-Arizona)
W77-02169

HYDROGEOLOGIC CHARACTERISTICS OF THE MISSOURI RIVER VALLEY FLOOD PLAIN,
Missouri Univ., Columbia. Dept. of Geology.
J. M. Sharp, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 355, Price codes: A04 in paper copy, A01 in microfiche Missouri Water Resources Research Center, Columbia, Completion Report, October 1, 1976. 60 p, 25 fig, 2 tab, 21 ref. OWRT A-085-MO(1), 14-34-0001-6026.

Descriptors: *Missouri River, *Flood plains, *Alluvial aquifers, Mathematical models, Bank storage, *Hydrogeology, Groundwater, Model studies, Water levels.
Identifiers: Lower Missouri River Valley

A combination study of field investigation, yearlong monitoring of river stage and ground-water conditions, and mathematical modelling provided insights into the unexpected variability of floodplain hydrogeology. The ground-water system reflects a continum of change rather than variations from a steady-state condition. Factors controlling ground-water levels are: distance from the river, time since any change in river stage, the geometry of river meanders and valley walls, inhomogeneities in top stratum materials, position of tributary creeks and whether these creeks are influent or effluent, long-term ground-water levels

near valley walls, and pumping. It was possible to separate the flood-plain study area into four types of ground-water response: areas of continuing ground-water high, areas of predominantly down valley flow, areas of slow ground-water response, and areas of rapidly fluctuating ground-water levels. River-ground water interactions were found to be predominantly effluent, predominantly influent, or alternating influent-effluent. Examination of field data cast serious doubts on the validity of common bank-storage model assumptions. Major alluvial aquifers are inhomogeneous and may be confined and/or unconfined. Furthermore, the Dupuit-Forcheimer conditions are not valid nor is the assumption of fully penetrating streams. The lower Missouri River Valley alluvium represents a major, but relatively little used aquifer.

STATUS OF GROUND-WATER MODELING IN THE U.S. GEOLOGICAL SURVEY,
Geological Survey, Reston, Va. Water Resources Div.
C. A. Appel, and J. D. Bredehoeft.
Available from the Branch of Distribution, USGS, 1200 S. Eads St., Arlington, Va., 22202. Circular 737, 1976. 9 p, 1 tab, 93 ref.

Descriptors: *Groundwater, *Model studies, *Research and development, *Hydrogeology, *Aquifer characteristics, Groundwater movement, Land subsidence, Surface-groundwater relationships, Water pollution sources, Path of pollutants, Geothermal studies, Economic feasibility.
Identifiers: *Groundwater modeling.

The U.S. Geological Survey is active in the development and use of models for the analysis of various types of ground-water problems. Types of problems for which models have been, or are being, developed include: (1) ground-water flow in saturated or partially unsaturated materials, (2) land subsidence resulting from ground-water extraction, (3) flow in coupled ground water-stream systems, (4) coupling of rainfall-runoff basin models with soil moisture accounting and aquifer flow models, (5) interaction of economic and hydrologic considerations, (6) predicting the transport of contaminants in an aquifer, and (7) estimating the effects of proposed development schemes for geothermal systems. The status of modeling activity for various models is reported as being in a developmental, verification, operational, or continued improvement phase. Recently published references that provide useful details on the characteristics of the models are identified. (Woodard-USGS)

STRATIGRAPHY OF THE PALEOCENE AND LOWER PART OF THE EOCENE IN WESTERN TENNESSEE,
Geological Survey, Nashville, Tenn. Water Resources Div.
W. S. Parks.
Tennessee Department of Conservation, Nashville, Division of Geology, Bulletin 75, p B1-B55, 1975. 34 fig, 1 plate, 2 tab, 67 ref.

Descriptors: *Geologic formations, *Stratigraphy, *Bedrock, *Fluvial sediments, *Tennessee, Hydrogeology, Groundwater, Aggregates, Geologic time, Geologic mapping, Petrology.
Identifiers: Western Tennessee, Paleocene, Eocene.

In 1965 the U.S. Geological Survey, Water Resources Division, in cooperation with the Tennessee Department of Conservation, Division of Geology, began a project to complete the geologic mapping of the outcrop area of the Paleocene and lower part of the Eocene in western Tennessee. The project area includes twenty-eight 7.5-minute quadrangles. The objective of the investigation was to provide detailed maps that would help inventory the mineral resources and to provide geologic information that would augment understanding of the ground-water resources in western Tennessee. The Clayton Formation and Porters Creek Clay (Midway Group) of the Paleocene Series and the Wilcox Formation and the lower part of the Claiborne Formation of the Eocene Series are the bedrock formations. The boundary between the Clayton Formation, the basal Paleocene unit, and the underlying formations of the Upper Cretaceous Series is within a sequence of similar sediments in most of western Tennessee. The fluvial deposits and alluvium make up surficial deposits, which cover the bedrock formations in extensive areas. Most of these deposits, which consist of sand, gravel, silt, and clay, are a part of the Pleistocene and Holocene Series, but some of the high-level fluvial deposits may be a part of the Pliocene Series. Southeastern Geology, Vol 16, No 4, p 227-240, May, 1975. 8 fig, 3 tab, 17 ref. OWRT A-025-FLA(1). 14-31-0001-5009.

Descriptors: *Groundwater movement, *Porosity, *Permeability, *Florida, *Resistivity, Measurement, Water level, Karst, Subsurface flow.

Preliminary electrical resistivity investigations in a low-relief karst terrain with a shallow water table provide a simple and inexpensive technique to identify possible water-filled solution cavities at shallow (0-50 feet) depths. Values from profiling and sounding measurements employing the Wenner electrode arrangement in Citrus County, Florida, were interpreted as indicative of solution cavities at a depth of 38 feet at one site and 20 feet at another. A shallow drilling program at the sites encountered solution voids at these depths, substantiating the effectiveness of the method. In addition, the measurements suggest lateral extent of the subsurface cavities and demonstrate a valuable auxiliary tool for the planning of drilling programs to detect subsurface cavities. SEDIMENTOLOGY AND PALEOECOLOGY OF MIDDLE AND UPPER EOCENE CARBONATE SHORELINE SEQUENCES, CRYSTAL RIVER, FLORIDA, U.S.A.,
Florida Univ., Gainesville. Dept. of Geology.
A. F. Randazzo, and H. C. Saroop.
Sedimentary Geology, 15, p 259-291, 1976. 12 fig, 2 tab, 65 ref. OWRT A-025-FLA(2). 14-31-0001-5009.

Descriptors: *Groundwater movement, *Porosity, *Permeability, *Sedimentology, *Florida, *Petrography, Petrology, Diagenesis, Lithification, Carbonates.
Identifiers: *Crystal River(Fla), *Lithofacies.

Petrographic analyses of six cores penetrating the Inglis and Avon Park Formations, from Crystal River, Florida, reveal a general regressive-transgressive cycle, aerial exposure and diagenesis. Three distinct lithofacies are represented: (I) biomicrite-poorly washed biosparite; (II) dolomitized biopelmicrite-biosparite and algal dololithite; and (III) pellet and intraclast-bearing biosparite. These lithofacies were deposited under shallow-marine conditions, at times even above the strand line. Lithofacies I was deposited in a shallow basin partly covered by marine grasses and dasyclad algae. Lithofacies II was deposited in the supratidal and intertidal zones and closely resembles the sedimentary characteristics of Holocene mud-flat deposits. Lithofacies III is the shallow-marine counterpart of the supratidal dolostone of lithofacies II and can be compared with a Holocene bank environment. This study illustrates the importance of Holocene analogues in determining and interpreting environments and demonstrates the need to consider sedimentary processes, both physical and biological, which operate in these zones. THE USE OF A SPECIFIC ION ELECTRODE FOR DETERMINATION OF BROMIDE IN SOILS,
Texas Engineering Experiment Station, College Station.
A. B. Onken, R. S. Hargrove, C. W. Wendt, and O. C. Wilke.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1223-1225, November-December 1975. 3 tab, 9 ref.

Descriptors: *Bromides, *Electrodes, *Tracers, Soil tests, Soil investigations, Chloride, Anions, *Soil analysis, Water analysis, Pollutant identification, *Soil chemistry.

Bromide has desirable characteristics for use as a tracer for NO3- in some soil studies. However, its quantitative determination in the presence of Cl-, which occurs in interfering quantities in many soils, requires lengthy procedures. Further, Br- interferes with the quantitative determination of Cl- for which concentrations may also need to be determined. To facilitate the use of Br- as a tracer in such tests, a procedure for the rapid and accurate determination of water-extractable Br- in the presence of Cl- and Cl- in the presence of Br- was developed. These quantitative determinations over a wide range of concentrations were accomplished by use of standard curves, interference curves, and successive approximations. Bromide added to soil over a wide range of concentrations was quantitatively recovered. (Skogerboe-Colo St)

Identifiers: *Conformal mapping, Vedernikov's solution.

An analytical solution which takes into account the general anisotropic behavior of the porous medium was found for the problem of seepage flow from an unlined trapezoidal canal. Since a canal in an anisotropic medium transforms into one with unequal slopes in an equivalent isotropic porous medium, the solution here was concerned with the problem of seepage flow from an unsymmetrical trapezoidal canal. The method of inversion of hodograph was made use of, and expressions for the seepage loss and the locations of the phreatic lines were obtained. Numerical results were presented for the equivalent isotropic flow domain. Using the transformation formulas given, the actual discharge and the locations of phreatic lines in anisotropic medium can be easily obtained for given physical parameters of the actual flow domain. The nonsymmetry of trapezoidal canals of side slopes less than one has considerable influence on the quantity of seepage. (Lee-ISWS)

TRANSIENT MOVEMENT OF WATER AND SOLUTES IN UNSATURATED SOIL SYSTEMS, PHASE II,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. D. Evans, T. W. Sammis, and A. W. Warrick.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 348, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, September 1976. 40 p, 14 fig, 9 tab, 12 ref. OWRT B-040-ARIZ(1), 14-31-0001-4059.

Descriptors: *Unsaturated flow, *Tritium, *Soil water movement, *Arizona, *Solutes, Deep percolation, *Seepage, Methodology, Salts, Aquifers, Water quality, Pollutant identification, Darcys law.
Identifiers: Deep seepage, Temperature profiles, *Phoenix(Ariz)

This project yielded results on the movement of water and solutes from beneath the root zone to a water table aquifer in an irrigated area near Phoenix, Arizona. Three methods were explored for estimating deep seepage rates. They were: (1) measurement of the hydraulic conductivities and gradients and by Darcy's equation calculating the seepage rate; (2) measurement of the temperature profile and calculating the seepage rate from the shape of the profile curve; and (3) measurement of he tritium concentation of the soil water and relating it to the history of the tritium concentration of precipitation. The different methods were used at one site where a deep well was drilled to obtain samples, but the temperature-profile method was tried at other locations. Errors are involved in all of the methods so results differed. At the principal site of study the Darcian velocity estimate (volume of flow per unit area per unit time) ranged from 9 to 38 cm/yr, while the actual velocity estimate (pore velocity) ranged from 57 to 130 cm/yr. The results from other sites indicated an even lower rate of seepage. The solute concentration of the soil water was higher than the aquifer water but, at the one site, the effect of salts in the seepage water should not significantly alter the quality of the aquifer water. Descriptors: *Trace elements, *Soil analysis, *Copper, *Manganese, Distribution patterns, Or-

ganic matter, Nitrogen, Carbon, Oxidation-reduction potential, Rivers, River beds.
Identifiers: Dnieper-Bug Rivers(USSR), *Liman soils.

The Cu content of the liman soils was 10(-5) -5.10(-3%) and that of MN 10(-2) -4.10(-1%). The distribution over the bottom was determined by the mechanical composition of the soil and its content of organic matter. Statistical calculations confirmed the close correlation between the content of Cu and Mn and Corg and Norg. An average inverse dependence on the pH value and redox potential of the soil columns was determined for Mn (USSR).--Copyright 1976, Biological Abstracts, Inc.

NITROGEN FIXATION BY ALGAE IN FESCUEGRASS SOIL CRUSTS,
Georgia Univ., Athens. Dept. of Agronomy.
G. B. Reddy, and J. Giddens.
Soil Science Society of America Proceedings, Vol. 39, No. 4, p 654-656, July-August 1975. 1 fig, 3 tab, 21 ref.

Descriptors: *Grasses, *Subsoils, *Nitrogen fixation, Nitrogen, Nutrients, Algae, Fertilization, Carbon, Fescues.

Soil crusts and subsoil samples of different ages of tall fescuegrass were collected and analyzed for N, C, and acetylene reduction. Total N and C in the crust was 0.18% and 2.76%, respectively, in 4-year old soil crust as compared to 0.06% and 0.67% respectively, in fallow soil. The amount of acetylene reduction after 5 days' incubation was 13.77 micro-mole/flash (9.6 cm2) for the 4-year-old sod crust compared to 3.06 micro-mole/flask for the fallow control. Ammonium nitrate reduced and liming increased N fixation in the crust. Nitrogen fixation in the crust was highest at 55% shade. Greater nitrogen fixation occurred when moss was present in crust. RATE OF DISSOLUTION OF PHOSPHATE FROM MINERALS AND SOILS,
Montana State Univ., Bozeman. Dept. of Chemistry.
R. A. Olsen.
Soil Science Society of America Proceedings, Vol. 39, No. 4, p 634-639, July-August 1975. 9 fig, 2 tab, 18 ref.

Descriptors: *Phosphates, Nutrients, Soil investigations, Laboratory tests, Roots, Minerology, Dispersion, Path of pollutants.

A laboratory technique was devised for conveniently measuring the rate of dissolution of phosphates in minerals and soils. The conditions imposed upon the samples were believed to be similar in several important respects to those in the close proximity of plant roots. An equation was derived which was reasonably descriptive of the dissolution process even in widely different soils. The technique was used to measure the rate of dissolution of a number of well-characterized rock phosphate samples and of may soils. The data were found to rate the samples very well with regard to their value as a source of phosphate to plants. (Skogerboe-Colo St)

THE EFFECT OF AMMONIA AND AMMONIA-SULFUR SOLUTIONS ON NITRIFICATION RATES AND CHEMICAL PROPERTIES OF A CALCAREOUS SOIL,
Texas Tech Univ., Lubbock. Dept. of Agronomy.
R. G. Stevens, and J. O. Reuss.
Soil Science Society of America Proceedings, Vol. 39, No. 4, p 787-793, July-August 1975. 7 fig, 2 tab, 25 ref.

Descriptors: *Nitrification, *Soil chemistry, *Soil chemical properties, *Chemical properties, *Ammonia, Soil properties, Nitrates, Nitrites, Sulfur.
Identifiers: Ammonia-sulfur solutions, Calcereous soils.

Nitrification rates and changes in chemical properties of a calcareous soil were investigated after injection of liquid anhydrous NH3 and anhydrous NH3-S solutions. Nitrification rates (on a whole pot basis) of 15.7, 25.3, and 32.2 mg of N per pot per day were found with the application of 200, 400, and 600 mg of N/pot, respectively. These nitrification rates were recorded during the initial 14 days of the study when total NO3- accumulation appeared to be linear. (Skogerboe-Colo St)

POTASSIUM-CALCIUM EXCHANGE EQUILIBRIA IN VOLCANIC-ASH SOILS,
Chile Univ., Santiago. Dept. of Chemistry.
E. B. Schalscha, P. F. Pratt, and L. Andrade.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1069-1072, November-December 1975. 3 fig, 4 tab, 12 ref.

Descriptors: *Potassium, *Calcium, Soils, Soil investigations, Soil chemistry, Chemical reactions, Equilibrium, *Cation exchange, Ion exchange.
Identifiers: *Potassium-calcium exchange equilibria, *Chile(Soils), *Volcanic-ash soils.

Potassium-Ca exchange equilibria were determined at potassium adsorption ratios (PAR) of 0.2, 2.0, and 20 for pH values of 4.8, 6.0, and 7.5 for four volcanic-ash soils of southern Chile. Increases in pH produced large increases in cation exchange capacity (CEC) which were largely balanced by increases in the amount of Ca adsorbed. The increases in exchangeable K with increase in CEC were relatively small. The relative affinities for K versus Ca at a PAR of 0.2 indicated that for each soil a small, but nearly constant, amount of negative charge had a high specificity for K. Beyond this small amount of CEC with a high affinity for K, the affinities for K were relatively low. (Skogerboe-Colo St)

A MODEL FOR THE SIMULTANEOUS PRODUCTION AND DIFFUSION OF FERROUS IRON IN SUBMERGED SOILS,
Agricultural Univ., Wageningen (Netherlands). Dept. of Soils and Fertilizers.
K. Harmsen, and N. Van Breemen.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1063-1068, November-December 1975. 4 fig, 19 ref.

Descriptors: *Model studies, *Iron, *Saturated soils, Soil horizons, Soils, Soil investigations, Rice, Diffusion, Path of pollutants, Soil profiles.
Identifiers: Rice paddy soils.

The model describes the distribution of dissolved ferrous iron as a function of time and depth in a flooded soil profile consisting of three distinct horizons. In this soil profile, the production of dissolved ferrous iron is high and constant with depth in the surface horizon, low and constant with depth in the subsoil, and varies linearly with depth between these two values in the intermediate horizon. The Fe2+ concentration is found as the difference of the rate of ferrous iron production, integrated over time and a diffusion term consisting of an infinite series of the third and fifth repeated integral of the complementary error function. The parameters considered are (1) three constants specifying the dependence of the ferrous iron formation on time and depth, (2) the depths of the three horizons, and (3) the apparent diffusion coefficient. As shown by one example, the general solution can be greatly simplified for many cases of practical interest. The inherent assumptions of the model and its application to actual waterlogged soils are discussed. (Skogerboe-Colo St)

FIXATION OF IRON AND ZINC APPLIED AS CHELATES INTO A SOIL COLUMN DURING LEACHING,
Hebrew Univ., Rehovoth (Israel). Dept. of Soil and Water Science.
N. Lahav, and M. Hochberg.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1213-1215, November-December 1975. 4 fig, 3 ref.

Descriptors: *Iron, *Zinc, *Leaching, Infiltration, Soil investigations, Sands, Chelation.
Identifiers: *Soil columns, Breakthrough curves.

The movement of iron in the form of FeEDDHA and FeEDTA and zinc in the form of ZnEDTA was studied in columns of Rehovot sand under several flow rates and in the presence of either Ca(N03)2 or KN03 with the same ionic strength of 0.0375M/liter. Chloride was used as a tracer. FeEDDHA was neither adsorbed nor fixed by the soil. Both ZnEDTA and FeEDTA were fixed in the soil column in the presence of Ca2+ but not in the presence of K+. ZnEDTA was not adsorbed significantly, whereas FeEDTA was adsorbed in the presence of either KN03 or Ca(N03)2 solutions. Reasonable agreement was obtained between experimental results and theoretical calculations of the breakthrough curves, based on the analytical solution of the general dispersion equation. DISSOLUTION OF ILLITE--A POSSIBLE MECHANISM OF POTASSIUM RELEASE,
Agricultural Research Organization, Bet-Dagan (Israel). Inst. of Soils and Water.
S. Feigenbaum, and I. Shainberg.
Soil Science Society of America Proceedings, Vol. 39, No. 5, p 985-990, September-October 1975. 3 fig, 2 tab, 18 ref.

Descriptors: *Potassium, *Aluminum, *Iron, *Magnesium, *Illite, Chemical reations, Diffusion, Soils.

The rate of potassium, aluminum, iron and magnesium release from Fithian illite in dilute salt

solutions and at pH > 3 was studied. Cumulative cation release was proportional to the square root of the duration of the treatment. The rate of Al release was similar to the rate of K release, whereas the rate of Fe and Mg release was about three x that of K and Al release. Since the only known mechanism for the release of the lattice cations is the dissolution of the clay, it is proposed that dissolution of the clay lattice is also the dominant mechanism by which potassium is released from the clay. Two consecutive reactions, a rapid exchange reaction and a slow first-order reaction, explain the experimental observations. (Skogerboe-Colo St)

SOIL CHANGES RESULTING FROM CROPPING,
Agricultural Research Service, Manhattan, Kans.
E. L. Skidmore, W. A. Carstenson, and E. E. Banbury.
Soil Science Society of America Proceedings, Vol. 39, No. 5, p 964-967, September - October 1975. 3 fig, 2 tab, 24 ref.

Descriptors: *Crops, Crop production, *Soil investigations, *Soil properties, Grasses, Pastures, Soil structure, Organic matter, Cultivation.

The need to document further the changes in soil properties from various cropping systems and the uniqueness of a long-time cultivated field adjacent to buffalograss pasture prompted the evaluation of soil-property changes of a Keith silt loam characteristic of that pasture and field. In the fall of 1973, the sod of the buffalograss pasture was broken for analysis. Soil samples were obtained from the pasture (newly broken sod) and the adjacent cultivated field. The wet aggregates from the pasture were stabler as compared with the cultivated field for both flash and vacuum wetting. However, the dry aggregates from the cultivated field were slightly stabler than those from the pasture. (Skogerboe-Colo St)

A THERMODYNAMIC MODEL FOR PREDICTING THE FORMATION, STABILITY, AND WEATHERING OF COMMON SOIL MINERALS,
Batelle-Northwest, Richland, Wash.
D. Rai, and W. L. Lindsay.
Soil Science Society of America Proceedings, Vol. 39, No. 5, p 991-996, September-October 1975. 5 fig, 2 tab, 33 ref.

Descriptors: *Model studies, *Weathering, Soils, Soil investigations, Mineralogy.
Identifiers: *Mineral transformations, *Thermodynamic models.

Numerous workers have examined the weathering products of soil minerals and have proposed empirical weathering sequences. Development is described of a thermodynamic model that predicts in a systematic way several mineral transformations that can occur in soils. According to this model, the stability of primary minerals increases in the order: Na-glass, K-glass, pyroxene, analcime, anorthite, low albite, muscovite, microcline, and quartz. The stability of secondary clay minerals depends on soluble silica. At pH 6 with high silica the order of increasing stability is: chlorite, halloysite, gibbsite, illite, dickite, beidellite, kaolinite, and montmorillonite; at low silica the order is: chlorite, halloysite, illite, beidellite, montmorillonite, dickite, kaolinite, and gibbsite. The stability of both primary and secondary minerals increases with pH. (Skogerboe-Colo St)

EFFECT OF DEGREE OF SOIL PROFILE DISRUPTION ON PLANT GROWTH AND SOIL WATER EXTRACTION,
Academy of Agricultural Sciences, Sofia (Bulgaria). Inst. of Soil Science.
K. Rakov, and H. V. Eck.
Soil Science Society of America Proceedings, Vol. 39, No. 4, p 744-746, July-August 1975. 3 fig, 3 tab, 9 ref.

Descriptors: *Soil profiles, *Infiltration, Soil investigations, Soil environment, Soil water, Soil horizons, Permeability.

Modification of slowly permeable soil profiles has been effective in ameliorating undesirable soil conditions. Various methods and depths of modification have been studied but little attention has been given to (1) the degree of disruption necessary to accomplish satisfactory profile modification or (2) the relative merits of topsoil-subsoil mixing and stockpiling and returning topsoil to the surface after profile modification. Seven degrees of profile disruption (clod size distributions in the B22t and mixing of topsoil with that horizon) were studied in simulated soil profiles in the greenhouse. Grain sorghum was grown on Pullman clay loam. Disturbance of the B22t layer increased yields but once that layer was disturbed, degree of disturbance had no further effect on yield. Compared with retaining topsoil on the surface, mixing it with the B22t did not affect yields. (Skogerboe-Colo St)

INTERACTIONS OF MICRONUTRIENTS IN BARLEY GROWN ON ZINC-POLLUTED SOILS,
Himachal Pradesh Univ., Palampur (India).
B. R. Singh, and K. Steenberg.
Soil Science Society of America Proceedings, Vol. 39, No. 4, p 674-679, July-August 1975. 2 fig, 7 tab, 41 ref.

Descriptors: *Nutrients, *Barley, *Zinc, Soil tests, Soil investigations, Crop response, Water pollution sources.
Identifiers: *Micronutrients.

Barley grown in zinc-polluted soils with variable levels of Zn, Mn, and Fe showed no marked differences in the yield attributable to these variables in both soils investigated. However, in direct contrast to results reported by other investigators, concentrations of 65Zn and total zinc were found to increase with increased levels of added Mn and/or Fe with few exceptions. Similarly, concentrations of 54Mn and total Mn also increased with increased levels of Zn and/or Fe. The effects of Zn and Mn on the concentrations of 59Fe and total Fe were inconsistent. The concentration of Mo was found to decrease with increased levels of Zn, Mn, and Fe and the decrease was more pronounced in one soil than in the other. (Skogerboe-Colo St)

NITRATE-NITROGEN REMOVAL FROM SOIL PROFILES BY ALFALFA,
Southwestern Great Plains Research Center, Bushland, Tex.
A. C. Mathers, B. A. Stewart, and B. Blair.
Journal of Environmental Quality, Vol. 4, No. 3, 1975. p 403-405, 3 fig, 3 tab, 12 ref.

Descriptors: *Nitrates, *Nitrogen, *Alfalfa, Crop response, Crop production, Phosphorus, Soil investigations, *Soil profiles, *Farm wastes, *Nutrient removal.
Identifiers: *Nitrate-nitrogen removal.

Alfalfa was established in the fall of 1971 on plots previously treated with 0, 22, 45, 112, or 224 metric tons/ha of manure annually for 3 years. Additional plots had received 224 kg N/ha annually for 3 years. Nitrate-nitrogen and water contents of the soil profile were determined by 30-cm increments to 6 m prior to planting. Nitrate-nitrogen was found to 6 m, but the largest concentrations were in the top 1.8 m, where amounts of NO3(-)-N varied from 100 to 2,400 kg/ha. Additional profile samples were taken in 1972 and 1973 after the final cutting of alfalfa. Alfalfa removed water and NO3(-)-N to a 1.8-m depth the first year and to 3.6 m the second year. These results indicate that alfalfa could remove NO3(-)-N from the lower depth of soil profiles where annual crops were not effective. Yield, NO3(-)-N, and P contents of alfalfa were increased by manure. Total N taken up by the crop was directly related to the yield. (Skogerboe-Colo St)

Shano silt loam soil developed from loessial and volcanic materials of recent origin under mild weathering conditions. It contains less than 5% of clay and 60% or more of silt. The rate of release of mineral K (Km) in this soil to 1N Cl solutions decreased in the order Na greater than Ca greater than Mg much greater than NH4. Release of Km may have involved some framework silicates, but for practical purposes the layer silicates controlled Km activity. (Skogerboe-Colo St)

REMOTE SENSING OF SOIL MOISTURE BY A 21-CM PASSIVE RADIOMETER,
Kansas Univ. Lawrence.
J. R. Eagleman, and W. C. Lin.
Journal of Geophysical Research, Vol. 81, No. 21, p 3660-3666, July 20, 1976. 6 fig, 2 tab, 16 ref. NASA NAS-9-13273.

Descriptors: *Remote sensing, *Soil moisture, *Microwaves, Satellites(Artificial), On-site data collections, Regression analysis, Precipitation(Atmospheric), Evaporation, Measurement, Vegetation, Vegetation effects, Temperature, Surveys.
Identifiers: *Skylab, Radiometers, Passive radiometers.

Microwave sensors on Skylab collected data as part of the Earth Resources Experiment Package (EREP). An investigation was designed to obtain field observations of soil moisture content for comparison with data from Skylab. The 21-cm radiometer was shown to be highly responsive to the moisture content of the upper 2.5-cm layer of soil. A composite relationship between the radiometric temperature and soil moisture content was determined from five data sets obtained over Kansas and Texas. This relationship, having a correlation index of -0.96, has been used as a basis for calculating the soil moisture content of large areas across the United States. (Sims-ISWS)

SATELLITE MICROWAVE OBSERVATIONS OF SOIL MOISTURE VARIATIONS,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
T. J. Schmugge, A. Rango, and R. Neff.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-15553, Price Codes: A03 in paper copy, A01 in microfiche. Preprint X-913-75-304, November 1975. 31 p, 10 fig, 2 tab, 5 ref.

Descriptors: *Remote sensing, *Vegetation, *Soil moisture, *Microwaves, Satellites(Artificial), Surveys, Measurement, Precipitation(Atmospheric), Evaporation, Vegetation effects, Soils, Agriculture.
Identifiers: *Microwave brightness temperature, Microwave emission.

The Electrically Scanning Microwave Radiometer (ESMR) on the Nimbus 5 satellite was used to observe microwave emissions from vegetated and soil surfaces over an Illinois-Indiana study area, the Mississippi Valley, and the Great Salt Lake Desert in Utah. Analysis of microwave brightness temperatures (T sub B) and antecedent rainfall over these areas provided a way to monitor variations of near-surface soil moisture. Because vegetation adsorbs microwave emission from the soil at the 1.55 cm wavelength of ESMR, relative soil moisture measurements can be obtained only over bare or sparsely vegetated soil. In general, T sub B increases during rainfree periods as evaporation of water and drying of the surface soil occurs, and drops in T sub B are experienced after significant rainfall events wet the soil. Microwave observations from space are limited to coarse resolutions (10-25 km), but it may be possible in regions with sparse vegetation cover to estimate soil moisture conditions on a watershed or agricultural district basis, particularly since daily observations can be obtained. It was concluded that further applications to agriculture and water resources need to be explored. (Sims-ISWS)

DRAINAGE OF VERTICAL COLUMNS OF LAKELAND SAND,
Florida Univ., Gainesville. Dept. of Soil Science.
G. K. Saxena, R. S. Mansell, and C. C. Hortenstine.
Soil Science, Vol. 120, No. 1, p 1-12, July 1975. 10 fig, 13 ref. OWRT A-026-FLA(4). BOM G0190838 (SWD-24).

Descriptors: *Drainage, *Sands, *Soil water, *Florida, Clays, Percolation, Retention, Stratification, Hydraulic conductivity, Columns, Hydraulic gradient, Infiltration, Root zone, Unsaturated flow, Phosphates, Velocity, Laboratory tests, Sieve analysis, Bulk density, Tensiometers, Discharge(Water).
Identifiers: *Lakeland sand, Phosphatic clay, Suction head, Time-dependence, Trickle irrigation.

A drainage experiment was conducted to determine the time-dependence of soil-water retention during drainage of a quasi-uniform column of Lakeland sand and similar columns to which phosphatic clay was added as an amendment or layer. Phosphatic clay was observed to increase and prolong water retention in the soil. Saturated hydraulic conductivity of the column with soil amended with 5% phosphatic clay in the surface 30 cm was 13 cm/hr, as compared to 25 cm/hr for the quasi-uniform column of Lakeland sand. Drainage from the columns with 1-cm-thick and 2-cm-thick layers of phosphatic clay aggregates was greatly restricted. The nonaggregated phosphatic clay layer provided nearly constant impedence to flow across the layer, whereas successive water desaturation of the larger pores in the layer aggregates resulted in a time-dependent impedence to water flow. At saturation the hydraulic conductivities of the aggregated and nonaggregated clay layers were calculated to be 5.0 and 0.8 cm/hr, respectively. Maximum hydraulic head gradients across the aggregated and nonaggregated clay layers were 4 and 13, respectively. Values of unsaturated hydraulic conductivity calculated from soil-water characteristic curves for the Lakeland sand and measured water-saturated hydraulic conductivity were in good agreement with values measured experimentally from the soil columns. ELEMENTS OF LIMNOLOGICAL SPECIFICITY OF LARGE LAKES IN THE TEMPERATE ZONE, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Institut Ozerovedeniya.
I. I. Nikolaev.
Gidrobiol Zh 11(6), p 5-10, 1975.

Descriptors: *Lakes, *Limnology, Algae, Canada, *Oligotrophy, *Photosynthesis, Zooplankton, *Temperate, Great Lakes, United States, Fish, Invertebrates.

The specificity of the nature of large lakes is directly or indirectly dependent on their limnological scale. Oligotrophy of large deep lakes of the temperate zone is determined by small specific mobilization of biogens from the land, their slow regeneration in the water and limited evacuation from deep water to the photosynthetic zone. Certain phenomena in the regime of large lakes make them similar to seas (stability of hydrological, hydrochemical and biological conditions, upwelling, wind surf in the littoral, etc.). Limnological specificity of large lakes is most pronounced in the temperate zone, E.G., Lake Ladoga, Lake Onega, Lake Baikal (USSR), the American Great Lakes (USA, Canada). Algae, zooplankton, invertebrates and fish are discussed.--Copyright 1976, Biological Abstracts, Inc

PREDICTED AND OBSERVED TEMPERATURE AND WATER-QUALITY CHANGES OF LAKES AND RESERVOIRS,
Geological Survey, Lakewood, Colo. Water Resources Div.
D. B. Adams.
Reprint from International Symposium on the Hydrological Characteristics of River Basins and the Effects on these Characteristics of Better Water Management, held in Tokyo, Japan, December 1975: International Association of Hydrological Sciences Publication No. 117, p 873-882, 1975. 15 fig, 9 ref.

Descriptors: *Model studies, *Reservoirs, *Water temperature, *Water quality, Forecasting, Inflow, Solar radiation, Specific conductivity, Discharge(Water), Correlation analysis, Data collections, Evaluation, Environmental effects, Dam design.

The model is a time-dependent, one-dimensional model that describes the temperature and water quality variation in the vertical direction and is based on the absorption and transmission of solar radiation, convection due to surface cooling, and advection due to inflows and outflows. The model was verified by simulation of the thermal and specific conductance distribution of Flaming Gorge Reservoir, Utah-Wyoming, during a 10-month period in 1972. Agreement between predicted and measured temperature profiles are excellent, with differences in localized areas being a maximum of 1.5 deg C. For 1972, maximum predicted discharge temperatures in the stream below the reservoir were 1.3 deg C less than those observed; agreement with time of maximum temperature is excellent. The actual average annual discharge temperature decreased 10 deg C after closing the dam. Specific conductance predictions in the reservoir, based on daily specific conductance inflow data, are very good and show the development of characteristic 'bulges or concavities' observed in the field profiles. This indicates that the solute distribution is indeed controlled by the hydrodynamics of the system. The model provides data useful for evaluating the design of the outlet structure of the proposed dam, the primary concern being to maintain a desired temperature range to control downstream quality and environmental effects. (Woodard-USGS)

Descriptors: *Aquatic microorganisms, *Benthic flora, *Oxidation-reduction potential, *Aerobic conditions, *Variability, Biological communities, Scavengers, Water requirements, Ponds, Shores.
Identifiers: *Macrophytes, Alisma plantago aquatica, Alopecurus aequalis, Bonn, *Caloric content, Equisetum fluviatile, Glyceria fluitans, Juncus effusus, Lycopus europaeus, Lysimachia vulgaris, Mentha aquatica, Myosotis palustris, Polygonum hydropiper, Sparganium erectum, West Germany, *Ash content.

In Aug. 1973 and Aug. 1974, 11 macrophytes (Alisma plantago-aquatica, Alopecurus aequalis, Lycopus europaeus, Polygonum hydropiper, Myosotis palustris, Equisetum fluvatile, Glyceria fluitans, Juncus effusus, Lysimachia vulgaris, Mentha aquatica, Sparganium erectum) of a pond-shore community near Bonn (West Germany) were investigated with regard to caloric values and ash content and the variability of these parameters. Due to the high constancy of the most important factor, 'availability of water', caloric values varied over rather narrow ranges or did not change at all. Mean values of the caloric determinations were obtained (4157.7 and 4161.2 cal/g dry weight; 4601.2 and 4606.1 cal/g ash-free dry weight) and compared with the data provided by other authors. In L. vulgaris L., intraspecific variations of the caloric values were determined according to the combustion of flowers, fruits, leaves, and stems.--Copyright 1975, Biological Abstracts, Inc.

LARGE-SCALE CURRENT MEASUREMENTS IN LAKE HURON,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
P. W. Sloss, and J. H. Saylor.
Journal of Geophysical Research, Vol 81, No 18, p 3069-3078, June 20, 1976. 7 fig, 12 ref.

Descriptors: *Water circulation, *Currents(Water), *Lake Huron, *Great Lakes, Current meters, Lakes, Circulation, Measurement, Temperature, Water temperature, Winds, Weather, Flow, Depth, Limnology.
Identifiers: Oscillatory currents.

Reanalysis of the data from the 1966 Great Lakes-Illinois River Basin Project (GLIRBP) of the Federal Water Pollution Control Administration (FWPCA) revealed some of the large-scale persistent summertime circulation patterns in Lake Huron. The greatest density of data from the original 45 current meter moorings covers June-August 1966, when some 21 stations returned synoptically significant data from current meters at depths of 10 and 15 m. From this somewhat sparse sample, it was deduced that at 10-m depth a counterclockwise circulation dominates the northern two thirds of the lake. The shallower southern portion shows a more complex pattern, with generally southward flow along the shorelines on both sides and a return flow northward near the center line of the southern basin. This latter pattern may decay later in the summer, but the data become too patchy for definite analysis. The data set from 15-m depth indicated similar circulations. Spectral analysis of currents at individual stations reveals a strong inertial rotation of the current vector at open lake sites. Only the data from the Straits of Mackinac lack the inertial component and are dominated by the lunar semidiurnal tide and the seiches of Lake Michigan. (Sims-ISWS)

AN EVALUATION OF PARAMETERS FOR THE THEORETICAL DISTRIBUTION OF PERIODS AND AMPLITUDES OF SEA WAVES,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
P. C. Liu.
Journal of Geophysical Research, Vol. 81, No. 18, p 3161-3162, June 20, 1976. 1 fig, 4 ref.

Descriptors: *Waves(Water), *Great Lakes, *Model studies, Mathematical models, Evaluation, Winds, Fetch, Energy, Frequency, Limnology, Equations.
Identifiers: Wave periods, Wave amplitudes.

Parameters used in characterizing the theoretical joint distribution of the periods and amplitudes of sea waves were evaluated in connection with an empirical, fetch-limited wave energy spectrum formula derived from wave data recorded in the Great Lakes. The results showed that the spectral width parameter obtained from the empirical formula justifies the narrow spectrum approximation used in the theoretical distributions. Further empirical data showed that the average wave periods calculated from an energy spectrum are quite close to those estimated from the statistical data. (Sims-ISWS)

COMPETITION AND SPACING IN PLANT COMMUNITIES: THE NORTHERN MOHAVE DESERT,
Pennsylvania State Univ., University Park. Dept. of Biology.
R. I. Yeaton, and M. L. Cody.
Journal of Ecology, Vol. 64, No. 2, p 689-696, July, 1976. 4 fig, 7 ref.

Descriptors: *Desert plants, *Plant growth, *Plant groupings, *Competing uses, Water supply, Biological communities, Water requirements, Root systems, Root development, Photosynthesis, Groundwater, Shrubs, Soil moisture, Arid lands, Deserts, Competition.
Identifiers: *Mohave Desert.

The arrangement of individual plants and their inter-relations in complex Mohave desert communities were examined. Three species were studied: Yucca schidigera, Opuntia acanthocarpa, and O. ramosissima. Desert plants compete for water, but are spaced far enough apart to eliminate effects of competition for sunlight. Distance measurements were made in the field, the size of each plant to be studied determined, and the photosynthetic surface area estimated. Results indicate that competition is occuring between the two species of Opuntia and that competition between Yucca and O. acanthocarpa, is as strong as that between the two Opuntia species. O. ramosissima tolerates O. acanthocarpa growing in closer proximity than a member of its own species. This suggests that interspecific differences occur in the structure or function of root systems. The plant community studied is composed of several species, each spaced out on the basis of size. The distribution patterns of each species are superimposed, subject to the following restraints: (1) no two individuals may occupy the same physical trunk space and (2) species which show interspecific competition must be spaced out in relation to the other species with some maximum degree of overlap tolerated. Results also show that it is not necessary to examine plants in pure stands to study competition and spacing. (Jamail-Arizona)

Waterhyacinth (Eichhornia crassipes (Mart.) Solms) at 95% moisture content was pressed in cylinders with perforated liners. Parameters affecting radial flow of expressed juices were examined. Particle size reduction, particularly by shearing, and cake rotation within the press increased expression efficiency. Fluid expression decreased as cylinder radius increased and available drainage area decreased. Optimum compression time is about 40 seconds. Cake density is related to material pressure. SCOURING OF COHESIVE SOILS,
Howard Univ., Washington, D. C. Dept. of Civil Engineering.
E. O. Kuti, and C-L. Yen.

Journal of Hydraulic Research, Vol. 14, No. 3, p 195-206, 1976. 6 fig, 1 tab, 9 ref.

Descriptors: *Scour, *Cohesive soils, *Laboratory tests, *Void ratio, *Plasticity index, Spillways, Erosion, Chemical properties, Kaolinite, Equilibrium, Model studies, Flow.
Identifiers: *Incipient motion, Equilibrium scour.

The analysis of the scouring problem was approached from the concept of incipient motion of the soil particles. A model spillway was constructed, and experiments were performed on mixtures of sand and clay minerals beyond the hydraulic jump. The general factors affecting scouring of cohesive bed downstream of a spillway were shown to be flow characteristics, soil properties, fluid properties, and boundary conditions. When the rate of flow is finite, there is limit to the extent of scour. The volume of solids, excluding voids, scoured in each soil test at a known percentage of clay mineral was the same irrespective of the in-situ void ratio before scouring was initiated. A low void ratio increases the time to reach the equilibrium scour. As the clay percentage increases, it takes longer to reach the equilibrium stage. The percentage of clay minerals and plasticity index can be used as parameters of soil to give an indication of the resistance of soil to erosion only when the type of chemicals in the eroding fluid are known. Plasticity index will also be good to compare erodibility of two types of soils if other conditions are the same. (Singh-ISWS)

GEOMETRY OF RIPPLES AND DUNES IN ALLUVIAL CHANNELS,
Roorkee Univ. (India). Dept. of Civil Engineering.
K. G. R. Raju, and J. P. Soni.
Journal of Hydraulic Research, Vol. 14, No. 3, p 241-249, 1976. 5 fig, 1 tab, 19 ref.

Descriptors: *Dunes, *Waves(Water), *Alluvial channels, *Flow resistance, *Bed load, Channel morphology, Seiment transport, Analytical techniques, Shear drag, Porosity, Equations, Mathematical studies, Theoretical analysis.
Identifiers: *Bed form geometry, Experimental data, Functional relations.

The bed of an alluvial channel gets deformed into various shapes - resulting in highly varying form resistance - with changes in fluid, sediment, and flow characteristics. Ripples and dunes are the most predominant bed features in natural streams and artificial canals characterized by small slopes. Knowledge of the size of ripples and dunes will make the flow resistance problems tractable. A semi-theoretical approach to the prediction of the average height and length of ripples and dunes was presented. The height of the dune was shown to be related to bed load transport rate and the advance velocity of the dune. The relationships between pertinent parameters were developed with the use of practically all available experimental data. It was learned that the parameters which influence the average length of the dunes also influence the average length of the ripples. The relations for height and length of ripples and dunes were given in dimensionless form. (Singh-ISWS)

Vermont Univ., Burlington. Dept. of Geology.
A. S. Hunt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 356, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, June 1976. 14 p, 5 fig, 2 ref. OWRT A-024-VT. (1). 14-34-0001-6047.

Descriptors: Sedimentation, *Lake sediments, *Sedimentation rates, Bedrock, Lakes, *Vermont, Bathymetry, Lake morphometry.
Identifiers: *Sediment thicknesses, *Lake Champlain(Vt).

Using geophysical techniques the thickness of sediments and shape of the bedrock basin have been studied in central Lake Champlain and compiled as sediment thickness and bedrock topography maps. Four major depressions have been recognized which correspond to maximum areas of sediment accumulation in which sediment thickness exceeds 700 feet. Maximum sedimentation rates in these areas are estimated to be 5 feet per hundred years. Sediment accumulation is most closely related to bedrock configuration rather than distance from shore or proximity to sediment source. With few exceptions the bedrock topography corresponds well with the present day bottom bathymetry.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 506, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, June 1976. 20 p, 5 fig, 6 ref. OWRT A-026-VT(1). 14-34-0001-6047.

Descriptors: Erosion, Lakes, *Vermont, *Beach erosion, *Bank erosion, *Lake shores.
Identifiers: *Lake Champlain(Vt).

Profile sites from three characteristic geological settings were surveyed in the Fall of 1975 to permit study of the amount and nature of shoreline movement in Lake Champlain. Two of the sites were resurveyed after the record spring high lake level of 1976. Recession of the toe of the bank was observed in all areas and is attributed to wave action; top bank recession is attributed to slumping and gully wash. A maximum recession of 11 feet at the top of the bank and eight feet at the toe has been observed. Deposition, which occurred in the offshore profiles during high spring lake level, is believed to be a response to the non-equilibrium condition. Factors recognized as of primary importance in the natural control of shoreline erosion are adequate vegetative cover and good bank drainage.

SEDIMENT PROBLEMS IN THE SAVANNAH RIVER BASIN,
Geological Survey, Lakewood, Colo. Water Resources Div.
R. H. Meade.
In: The Future of the Savannah River; Proceedings of a Symposium held at Hickory Knob State Park, McCormick, South Carolina, October 14-15, 1975: Published by Water Resources Research Institute, Clemson University, Clemson, South Carolina. p 105-129, June 1976. 9 fig, 47 ref.

Descriptors: *Sediment transport, *Sedimentation, Sediment load, *Soil erosion, *Streamflow, Sediment yield, Sedimentology, Reservoirs, Alluvium, Estuaries, Topography, Data collections.
Identifiers: *Savannah River(Geo-SC), Piedmont, Fall line.

Sediment in the Savannah River (Georgia-South Carolina boundary) is derived mainly from the parts of the basin that lie above the fall line -- particularly the Piedmont province. Accelerated erosion has stripped some 3 to 4 billion cubic meters of sediment from the Piedmont uplands since 1700. However, more than 90 percent of this sediment has not been carried across the fall line by the river; it remains stored on the hill slopes and in the stream bottoms of the Piedmont. Large reservoirs trap most of the sediment moving down the main stem of the Savannah. The sediment that accumulates in the dredged navigation channels of the estuary is only partly attributable to upland sources; other sources remain to be identified. (Woodard-USGS)

DESCRIPTIONS AND CHEMICAL ANALYSES FOR SELECTED WELLS IN THE CENTRAL SACRAMENTO VALLEY, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
R. P. Fogelman.
Open-file report 76-472, July 1976. 71 p, 3 fig, 33 maps, 4 tab.

Descriptors: *Groundwater resources, *Water wells, *Well data, *Water quality, *California, Water utilization, Water yield, Water levels, Drawdown, Chemical analysis, Basic data collections, Sampling.
Identifiers: *Central Sacramento Valley(Calif).

The Sacramento Valley occupies the northern one-third of the Great Central Valley of California. The study area of this report includes about 1,200 square miles (3,100 square kilometers) adjacent to the Sacramento River from Knights Landing to Los Molinos, in parts of Yolo, Sutter, Colusa, Glenn, Butte, and Tehama Counties. Between April and August 1975, 559 wells were canvassed, and during September and October 1975, water samples were collected for chemical analysis from 209 of these wells. Field determinations of alkalinity, conductance, pH, and temperature were made on the site at the time of sampling. Samples were prepared in the field for shipment and analysis for individual constituents at the Geological Survey Central Laboratory, Salt Lake City, Utah. Descriptive data for water wells are listed, chemical data are tabulated, and the location of wells is shown on maps. (Woodard-USGS)

SILVER CONTENT OF PRECIPITATION FROM SEEDED AND NONSEEDED FLORIDA CUMULI,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
J. Wisniewski, W. R. Cotton, and R. I. Sax.
Journal of Applied Meteorology, Vol. 15, No. 9, p 1004-1011, September 1976. 4 fig, 4 tab, 13 ref.

Descriptors: *Silver iodide, *Rainfall, *Florida, Measurement, Chemical analysis, Aircraft, Sampling, Precipitation(Atmospheric), Storms, Chemistry, Chemistry of precipitation, Cloud seeding, Pollutants, Water pollution sources, Meteorology.
Identifiers: *Silver.

A subprogram of NOAA's 1973 Florida Area Cumulus Experiment (FACE) was undertaken to determine the silver content of precipitation associated with convective clouds massively seeded with silver iodide nucleant over southern Florida. An atomic absorption analysis of 127 rainwater samples collected just below cloud base by a polypropylene-lined scoop mounted on the fuselage of the NOAA DC-6 aircraft indicated that the mean concentration of silver obtained on seed days (69 samples) was no greater (and, in fact, appreciably less) than that obtained on no-seed days (58 samples). In both sets of samples, the median concentration of silver was more than two orders of magnitude lower than the U.S. Public Health safety limit of 5 X 10 to the -8th power g/ml. Of the 69 aircraft samples collected on seed days, only two contained a concentration of silver in excess of 1 X 10 to the -9th power g/ml. Of the 58 aircraft samples collected on no-seed days, eight contained silver in concentrations exceeding 1 X 10 to the -9th power g/ml. The samples collected from the aircraft showed higher mean concentrations of silver than did those collected on the ground. An atomic absorption analysis of 79 rainwater samples collected at both fixed and mobile sites on the surface showed that the mean concentration of silver on seed days was three orders of magnitude less than 5 X 10 to the -8th power g/ml; the maximum concentration of silver found in any sample did not exceed 1 X 10 to the -9th power g/ml. Statistical results from the nonparametric Mann-Whitney Wilcoxon test suggest that the surface seeded (34 samples) and surface nonseeded (45 samples) data come from the same population (i.e., no significant differences between the two data sets). There is some evidence (from a separate set

of surface rainwater samples collected upwind of the target area) to suggest a persistently higher (by about a factor of 2 or 3) mean concentration of silver during the course of the experiment than either before of after the experiment. (Sims-ISWS)

MODIFICATION OF A COMMERCIAL SPECTROFLUOROMETER FOR RAPID DETERMINATION OF NEAR INFRARED EMISSION,
Auburn Univ., Ala. Charles Richard Saunders Chemical Lab.
W. C. Neely, T. D. Hall, S. Cravitt, and J. H. DeLap.
Applied Spectroscopy, Vol. 29, No. 2, p. 205-206, March-April 1975. 4 fig, 3 ref. OWRT A-035-ALA(8).

Descriptors: Ultraviolet radiation, Instrumentation, Analytical techniques, Spectrophotometry, *Spectrometers, *Fluorometry.
Identifiers: Near infrared emission, Luminescence, Wavelength adapter, *Spectrafluorometers, Phosphorescence.

A simple method is described for extending the spectral region of the Farrand spectrofluorometer Mark I. The wavelength adapter is inexpensive and can be inserted rapidly. A Hamamatsu R-446 photomultiplier tube (PMT) in conjunction with the wavelength adapter extends the spectral region to 900 nm. The fluorescence and phosphorescence spectra of Victoria Blue B in ethanol were obtained in this extended region.

CALCIUM EQUILIBRIUM IN MIXED ION AQUEOUS SYSTEMS OPEN TO THE ATMOSPHERE,
New Mexico State Univ., Las Cruces. Dept. of Agronomy.
G. A. O'Connor, and C. F. Cadena.
Soil Science, Vol. 120, No. 3, p 182-187, 1975. 4 fig., 3 tab., 20 ref. OWRT A-048-NMEX(2).

Descriptors: *Calcite, *Calcium carbonate, *Aqueous solutions, *Equilibrium, Chemical properties, Thermodynamic behavior, Ions.
Identifiers: Ion pairs, Activity coefficients, Partial pressure of CO2.

Calcite solubility is of major importance to geologists and soil scientists, and yet attempts to characterize the system in terms of basic chemical relationships have met with limited success. The model reported herein adequately describes calcite equilibria in aqueous solutions open to the air that have practical significance to both geologists and soil scientists. Equations accounting for activity coefficients and various ion pair formations were sufficient to describe calcite equilibrium in solutions of widely varying ionic characteristics. Sixty out of 73 solutions selected from the literature yielded calculated Kisp values for calcite ranging from 2.6 to 4.0 X 10-9 with an average of 3.3 X 10-9. (Hain-New Mexico State)

A MIXED-DIMENSION KINEMATIC ESTUARINE MODEL,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
A. J. Elliott.
Chesapeake Science, Vol. 17, No. 3, p 135-140, September 1976. 7 fig, 5 ref, 1 append.

Descriptors. *Estuaries, *Model studies, *Salinity, *Potomac River, Salt balance, Spring, Equations, Mathematical models, Mixing, Water circulation, Water quality, Biology, Fish, Path of pollutants.

A kinematic model, developed for use during conditions of low salinity when the upper reaches of an estuary are vertically mixed, divides the estuary into one- and two-dimensional regimes. The model was applied to the Potomac by assuming that the estuary is one-dimensional above Maryland Point and two-dimensional seaward of Morgantown. The model appears to reproduce features of estuarine mixing, especially during the spring conditions of low salinity. Such a model may have application to biological problems which involve the transport of fish eggs and larvae. (Humphreys-ISWS)
W77-02131

THE CIRCULATION AND SALINITY DISTRIBUTION OF THE UPPER POTOMAC ESTUARY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
A. J. Elliott.
Chesapeake Science, Vol. 17, No. 3, p 141-147, September 1976. 8 fig, 3 tab, 6 ref.

Descriptors: *Potomac River, *Circulation, Flow, Profiles, Salinity, Currents, Shear, Return flow, Estuaries, Monthly, Path of pollutants.
Identifiers: *Upper Potomac estuary, *Circulation distribution, *Maryland point, Current data, Salinity distribution, Internal circulation, Reverse flow, Vertical shear.

Salinity and current data from the Upper Potomac estuary were analyzed to determine the intensity of the internal circulation. One set of data, collected during the fall of 1973, suggested that a reverse flow existed as far upstream as Maryland Point. Data taken during other periods indicated that an estuarine circulation, with a reverse flow in the lower layer, was not well developed above Morgantown. However, the net seaward flow did decrease significantly with depth at all stations below Douglas Point and caused vertical shear in the mean profiles. Although there was no direct observational evidence from the measurements, it seemed possible that a return flow existed close to the bottom at some of the stations. Using a 4/3's law, the horizontal eddy diffusivity was estimated to be of the order of 2,000,000/s during April 1974. (Roberts-ISWS)

DISTRIBUTION OF CALCIUM CARBONATE IN SURFACE SEDIMENTS OF THE ATLANTIC OCEAN,
Lamont-Doherty Geological Observatory, Palisades, N. Y.
P. E. Biscaye, V. Kolla, and K. K. Turekian.
Journal of Geophysical Research, Vol. 81, No. 15, p 2595-2603, May 20, 1976. 6 fig, 1 tab, 29 ref. NSF IDO-74-04204, NSF IDO-75-19627.

Descriptors: *Sediments, *Calcium carbonate, *Atlantic Ocean, Surveys, Measurement, Mapping, Distribution, Distribution patterns, Sediment distribution, Spatial distribution, Bathymetry, Depth, Oceans, Chemicals, Carbonates, Calcium compounds, Detritus, Sedimentology, Oceanography.
Identifiers: *Calcium carbonate distribution, Surface sediments.

The areal distribution of calcium carbonate in the surface sediments of the Atlantic Ocean and adjacent seas and oceans was mapped on the basis of over 1700 data points. The following conditions were found to exist: The first-order relation of carbonate distribution to water depth is evident in both the areal distribution and the plots of carbonate versus depth for 11 areas of the Atlantic. Superimposed on this relation are significant variations in both the 100% and the 0% CaC03 depth intercepts, analogous to the (calcite) lysocline and the (calcite) carbonate compensation depth, respectively. Variations in these critical parameters between the 11 areas were related to the three rate processes which control carbonate distributions: surface productivity, dissolution, and dilution by noncarbonate biogenic and nonbiogenic sediment. The areal distribution of carbonate in surface sediments was compared with that in sediments deposited at the end of the last glacial epoch, 18,000 yr B.P., when carbonate abundance was markedly lower. (Sims-ISWS)

DISTRIBUTION OF CARBONATE IN SURFACE SEDIMENTS OF THE PACIFIC OCEAN,
Scripps Institution of Oceanography, La Jolla, Calif.
W. H. Berger, C. G. Adelseck, Jr., and L. A. Mayer.
Journal of Geophysical Research, Vol. 81, No. 15, p 2617-2627, May 20, 1976. 12 fig, 77 ref. NSF GA-41078, ONR N00014-69-A-0200-6049.

Descriptors: *Sediments, *Calcium carbonate, *Pacific Ocean, Mapping, Distribution patterns, Sediment distribution, Spatial distribution, Bathymetry, Depth, Oceans, Chemicals, Carbonates, Calcite, Calcium compounds, Detritus, Recent epoch, Sedimentology, Oceanography
Identifiers: *Calcium carbonate distribution, Surface sediments.

The distribution of carbonate on the floor of the Pacific was remapped on the basis of 1313 points from 80 references stored in the World Ocean Sediment Data Bank of Scripps Institution of Oceanography. Percent distribution maps and carbonate versus depth diagrams generally agreed with previously published information and reflected the major controlling factors of carbonate sedimentation (depth, hydrography, fertility, and sedimentary processes). While carbonate distributions are of limited use in attempting to construct dissolution profiles, major trends were identifiable. In particular, the degree of lowering of the equatorial calcite compensation depth (CCD) together with an estimate of the differences in supply rates between the equator and the sub-

tropical gyre can be used to estimate dissolution rate increase below the lysocline. There was considerable variation in the sharpness of the 'CCD transition,' a concept defined here. This variation was thought to reflect both geographic differences in dissolution rate gradients and redeposition processes (carbonate, deep-sea sediments, calcite, and compensation depth). TRACKING A GULF STREAM RING WITH SOFAR FLOATS,
Naval Oceanographic Office, Washington, D.C.
R. E. Cheney, W. H. Gemmill, M. K. Shank, P. L. Richardson, and D. Webb.
Journal of Physical Oceanography, Vol. 6, No. 5, p 741-749, September 1976. 9 fig, 2 tab, 16 ref. ONR NR 083-328, NSF 10075-08765.

Descriptors: *Oceans, *Ocean circulation, *Eddies, *Atlantic Ocean, On-site investigations, Circulation, Water circulation, Floats, Buoys, Movement, Currents(Water), Ocean currents, Tracking techniques, Oceanography.
Identifiers: *Gulf Stream, *Gulf Stream rings, *Sargasso Sea.

An experiment to test the feasibility of tracking Gulf Stream rings with neutrally buoyant SOFAR floats was begun in September 1974. Three floats were launched at depths of 750, 1050, and 1080 m in a ring west of Bermuda. One float left the ring after 3 weeks. The other two floats remained in the ring for 2-3 months while it moved 375 km westward at a rate of 6 cm/s; they were subsequently entrained by the Gulf Stream off Cape Hatteras. A second ring seeded with floats coalesced with the Gulf Stream, and five of its six floats were carried eastward in the Stream. The sixth float drifted south out of the ring and into the Sargasso Sea. One float was launched in the Sargasso between the two rings; its net drift over a 6-month period was to the west at 1.1 cm/s. These results indicated that there is considerable exchange of water between a ring and surrounding water at depths of 750 to 1100 m and that rings can be tracked for periods of only a few months with SOFAR floats at these depths. Paths of the three floats tracked in the northwestern Sargasso Sea outside of rings and the Stream indicated a net westward drift approximately equal to the observed westward movement of rings in this region. (Sims-ISWS)

GULF STREAM KINEMATICS INFERRED FROM A SATELLITE-TRACKED DRIFTER,
Texas A and M Univ., College Station. Dept. of Oceanography.
A. D. Kirwan, Jr, G. McNally, and J. Coehlo.
Journal of Physical Oceanography, Vol. 6, No. 5, p 750-755, September 1976. 5 fig, 11 ref. ONR N00014-75-C-0537.

Descriptors: *Oceans, *Ocean circulation, *Atlantic Ocean, Floats, Buoys, Satellites(Artificial), Circulation, Water circulation, Currents(Water), Ocean currents, Tracking techniques, Velocity, Energy, On-site investigations, Drift bottles, Oceanography, Remote sensing.
Identifiers: *Gulf Stream, Kinetic energy, Kinematics, Acceleration.

A drifter was deployed in the Gulf Stream and tracked for 5 months by the Nimbus 6 satellite. From this experiment the technical capability of the satellite fixing system was assessed for measuring ocean currents, the drifter trajectory as it relates to the Gulf Stream position as determined by other independent means, and the kinematics and accelerations following the Stream axis. It was shown that the trajectory agrees quite well with the other data on the location of the Gulf Stream. The velocities, accelerations and kinetic energies derived from the trajectory were compared with previous studies. A comparison was made of the kinetic energy of the Gulf Stream as inferred from the drifter with some recent calculations made from ship drift. (Sims-ISWS)
W77-02140

DISTRIBUTION OF SALINITY AND TEMPERATURE IN THE HUDSON ESTUARY,
City Univ., of New York. Inst. of Marine and Atmospheric Sciences.
E. S. Posmentier, and J. W. Rachlin.
Journal of Physical Oceanography, Vol. 6, No. 5, p 775-777, September 1976. 2 fig, 7 ref.

Descriptors: *Salinity, *Temperature, *Estuaries, Mixing, On-site investigations, Measurement, Surveys, Distribution patterns, Spatial distribution, Circulation, Water circulation, Hudson River, *New York.
Identifiers: *Temperature-salinity relationships, *Hudson River estuary.

Vertical salinity profiles in the Hudson Estuary are extremely variable and often contain finestructure similar to that in oceanic stratification. This finestructure may be caused by the stability-dependent vertical diffusion of salt. The interpretation of T-S diagrams indicated that, to a first order, temperature and salinity are controlled by conservative mixing processes and that residence time in the Estuary is approximately one or two weeks. (Sims-ISWS)

OXYGEN IN A TIDAL RIVER: LOW TIDE CONCENTRATION CORRELATES LINEARLY WITH LOCATION,
North Carolina Univ. at Chapel Hill. Marine Sciences Program.
D. Frakenberg.
Estuarine and Coastal Marine Science, Vol. 4, No. 4, p 455-460, July 1976. 3 fig, 15 ref. NSF GA23488, GA34793.

Descriptors: *Dissolved oxygen, *Estuaries, *Georgia, *Tidal streams, Intertidal areas, Estuarine environment, Lagoons, Tidal waters, Tidal effects, On-site investigations, Surveys, Oxygen, *Path of pollutants.
Identifiers: *Duplin River(Ga), Low tide.

A two-year survey of dissolved oxygen distribution in the Duplin River, Georgia, was initiated in December 1971. The Duplin is a 12 km lagoon-type tidal river draining about 1142 hectares of salt marshes along the western edge of Sapelo Island, Georgia. It is a typical lagoon-type tidal river, i.e. and elongate, dendritic watercourse, parallel to shore and separated from the ocean by a barrier island. The circulation is dominated by tidal currents; but, since the lagoon ends blindly in surrounding salt marshes, it has no significant source of upland drainage, and its waters are rarely diluted measurably by freshwater from land runoff. Low tide dissolved oxygen concentration correlates with location along the course of the Duplin River. Concentration generally decreases with distance upstream, although the reverse situation also occurs. The relationship is linear and can be used predictively. The influence on this relationship of tidal circulation, in situ oxygen consumption and production, and rainfall was discussed. (Humphreys-ISWS)
W77-02145

A COMPARISON OF LUMPED-PARAMETER AND DIFFUSIONAL MODELS DESCRIBING THE EFFECTS OF THE OUTLET BOUNDARY CONDITIONS ON THE MIXING IN FLOW SYSTEMS,
City Coll., New York. Dept. of Chemical Engineering.
Y. Zivrin, and R. Shinnar.
Water Research, Vol 10, No 9, p 765-779, 1976. 12 fig, 2 tab, 21 ref, 2 append.

Descriptors: *Model studies, *Estuaries, *Dispersion, Mixing, Coasts, Outlets, Mass transfer, Diffusion, Flow, Mathematical models, Equations, Tidal effects, Inlets(Waterways), Flow system.
Identifiers: Diffusional model, Lumped-parameter model.

A comparison was presented between two methods of modeling the dispersion and mixing processes in large (geophysical) turbulent flow systems such as estuaries, coastal waters, and atmospheric systems. One method was based on the diffusional model, and the other was a lumped-parameter model referred to as 'box-model' or compartmental model. The models were compared on the basis of model free parameters defined here: the purging rate and remaining life distribution. It was found that there exists a good agreement between the results of both models for a one-dimensional system. The problem of the boundary condition at the outlet was discussed; it was concluded that the use of a mass transfer coefficient may be justified in some cases where inflows at the outlet (e.g., due to tidal motion) can be estimated. When these inflows are strong, a sink at the outlet can be taken as a boundary condition. (Humphreys-ISWS)
W77-02147

SWIMMING OF SLENDER FISH IN A NON-UNIFORM VELOCITY FIELD,
Massachusetts Inst. of Tech., Cambridge. Dept. of Ocean Engineering.
J. N. Newman.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A021 564, Price codes: A02 in paper copy, A01 in microfiche. Reprint from the Journal of the Australian Mathematical Society, Vol. 19 (Series B), Part 1, p 95-111, 1975. 3 fig, 12 ref. ONR N00014-67-A-0204-0023, NSF GK-43886X.

Descriptors: *Fish, *Swimming, *Model studies, *Mathematical models, Mathematics, Velocity, Waves(Water), Hydrodynamics, Fish behavior, Oceans, Aquatic life.
Identifiers: *Fish hydrodynamics, Slender body theory, Porpoises.

The hydrodynamic pressure forces acting upon a slender fish were derived for the case of a fish swimming in a non-uniform velocity field. Possible applications are the effects on fish propulsion of swimming in waves, in turbulent eddies, and in the presence of other fish or a moving ship. The fish was assumed to be a slender body, with no vorticity shed into the fluid except at a single abrupt trailing edge located at the posterior end of the fish, and to be performing small lateral swimming undulations of its body. The non-uniform field through which the fish swims was assumed to be irrotational, and this field as well as the body undulations must be slowly-varying on the length-scale of the lateral fish dimensions. Expressions were derived for the local force and the time-averaged total thrust force. These were applied to the study of steady-state bow-riding and wave-riding of porpoises. (Sims-ISWS)

THEORETICAL MONOCHROMATIC-WAVE-INDUCED CURRENTS IN INTERMEDIATE WATER WITH VISCOSITY AND NONZERO MASS TRANSPORT,
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
T. A. Talay.
Report NASA TM X-3312, December 1975. 27 p, 5 fig, 12 ref, 1 append.

Descriptors: *Model studies, *Currents(Water), *Waves(Water), *Water circulation, Mathematical models, Mass transfer, Oceans, Continental shelf, Velocity, Circulation, Boundary layers, Equations, Oceanography.
Identifiers: *Wave-induced mass-transport currents.

Some wave-induced mass-transport current theories with both zero and nonzero net mass (or volume) transport of the water column are reviewed. A relationship based on the Longuet-Higgens theory was derived for wave-induced, nonzero mass-transport currents in intermediate water depths for a viscous fluid. The relationship was in a form useful for experimental applications; therefore, some design criteria for experimental wave-tank tests were also presented. Sample parametric cases for typical wave-tank conditions and a typical ocean swell were assessed by using the relation in conjunction with an equation developed by Unluata and Mei for the maximum wave-induced volume transport. Calculations indicated that substantial changes in the wave-induced mass-transport current profiles may exist dependent upon the assumed net volume transport. A maximum volume transport, corresponding to an infinite channel or idealized ocean condition, produced the largest wave-induced mass-transport currents. These calculations suggested that wave-induced mass-transport currents may have considerable effects on pollution and suspended-sediments transport as well as buoy drift, the surface and midlayer water-column currents caused by waves increasing with increasing net volume transports. Some of these effects were discussed. (Sims-ISWS)

REACTIONS OF WHITE SEA ORGANISMS TO A DECREASE OF SALINITY IN CONNECTION WITH FRESHWATER DISCHARGE INTO BAYS, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
V. V. Khlebovich.
Gidrobiol Zh 11(5), p 88-91, 1975.

Descriptors: *Salinity, *Bays, Aquatic animals, Migration, Reproduction, Oceans, Freshwater, *Saline water-freshwater interfaces.
Identifiers: *White Sea(USSR).

Recommendations are given relative to the discharge of fresh water into the sea to minimize the adverse effects on the marine fauna. Large masses of fresh water should be discharged at the initial phase of the ebb tide; the layer of fresh water should not be greater than the height of the tide range, which precludes its effect on sublittoral stenohaline organisms. Considerable masses of fresh water in the littoral should be avoided since a lethal effect can occur at 5-8% salinity. There is a particular danger in the discharge of large masses of fresh water during intense reproduction of boreal species. Discharge of water should begin gradually to avoid shock in animals that migrate.--Copyright 1976, Biological Abstracts, Inc.

Descriptors: *Salinity, *Estuaries, Vegetation, Aquatic plants, Europe, Sea water, *Halophytes.
Identifiers: *Chara, Kuban, Macrophytes, *Myriophyllum, Phytomass, *Potamogeton-pectinatus, Russian-SFSR, USSR, Euryhalines, Glycophiles, *Kuban estuaries(USSR).

In 1969-1970 changes in the vegetation of the Gorki estuaries of the Kuban estuaries (Russian SFSR, USSR) due to salinization were studied. During the summer they were pumped out and filled with seawater. The species composition of the vegetation was greatly impoverished, decreasing from 27-7 spp. with the elimination of all glycophiles, the preservation of only the euryhalines and the appearance of a halophyte. The composition, structure, area and projective cover of the phytocenosis was altered and the yield of the aboveground phytomass of the aquatic plants was greatly reduced. As a result, the types of emergent vegetation of these estuaries changed from Potomageton pectinatus-Myriophyllum-Chara, into Myriophyllum-P. pectinatus.--Copyright 1976, Biological Abstracts, Inc.

KELP HABITAT IMPROVEMENT PROJECT,
California Inst. of Tech., Pasadena. W. M. Keck Lab. of Environmental Engineering Science.
W. J. North.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 919. Price codes: A06 in paper copy, A01 in microfiche. Annual Report, 1974. 115 p. 34 fig., 17 tab., 71 ref. GH-92.

Descriptors: Habitats, *Planting management, *Kelps, Cultures, Storage, Marine algae, Vegetation establishment, Phaeophyta, Nutrient requirements, California, Littoral, Oceans.

Identifiers: *Macrocystis, Egreria laevigata, Cystoseira osmundacea, *Kelp Habitat Improvement Project, Seaweed, Sea urchins.

The results of kelp habitat improvement off the Southern California coast, for fiscal year 1974 are reported. Principal findings included: (1) 1973 harvests from the La Jolla and Point Loma kelp beds fell by 60% and 75% respectively, probably due to severe winter storms, (2) destruction of the Macrocystis canopies at Point Loma was accompanied by changes in the size distributions of the sea urchins, Strongylocentrotus franciscanus and S. purruratus, (3) the north Imperial Beach site was again overrun by seaweed-grazing urchins, (4) kelp restoration in the coastal region from Newport Bay to Laguna Beach is virtually complete, (5) kelp beds between Monarch Bay and Dana Point were greatly expanded, reversing a fifteen year trend of deterioration, (6) Macrocystis plants were introduced to Abalone Cove, (7) a massive development of Egregia and Cystoseira occurred along the Palos Verdes Peninsula, (8) further observations on seasonality patterns of fruiting by Laminaria, Eisenia, Pterygophora, and Agarum were recorded, and (9) Macrocystis developed naturally in areas cleared of Laminaria and Pterygophora, and were transplanted in several areas of Point Loma and La Jolla. Results of laboratory studies involving Macrocystis culture, nutrition, storage, and dispersion are also reported. In addition, a wide variety of studies relating to the effect of sea urchins on seaweed cover is summarized. (Luedtke-Wisconsin)

EVALUATION OF CIRCULATION IN ESTUARIES,
Lawler, Matusky and Skelly Engineers, Tappan, N.Y.
D. A. Abood, and E. L. Bourodimos.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY9, Proceedings Paper 12408, p 1211-1224, September 1976. 6 fig, 23 ref, 2 append.

Descriptors: *Density, *Flow, *Estuaries, Hudson River, *New York, Fluid mechanics, Hydraulics, Turbulence, Velocity, Equations, Water circulation, On-site investigations, Currents(Water).
Identifiers: *New York Harbor, *Stratified estuaries, Ocean-derived salt, Nontidal flow, Density-induced circulation.

Several approaches for describing density-induced circulation patterns in partially stratified estuaries have been developed. Published techniques developed by several investigators and recently established methods which were used to convert Hudson River tidal velocities and salinity observations to density-induced flow rates were reported in this paper. Generally, the two-layer stratified flow system approach exhibited several favorable characteristics such as relatively more stable and predictable distribution; greater independence of temporary meteorological and local eddy conditions; and simplicity, ease, and availability of more precise detection instruments. Density-induced flow values obtained using the two-layer flow method were more realistic than their salt budget counterparts and were somewhat higher than those derived from tidal velocity observations. ARE THE CHESAPEAKE BAY WATERS WARMING UP,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography and Environmental Engineering.
D. K. Brady.
Chesapeake Science, Vol 17, No 3, p 225-227, September 1976. 5 fig, 3 ref.

Descriptors: *Chesapeake Bay, *Bays, *Meteorological data, Nuclear powerplants, Water temperature, Air temperature, Thermal water, Time series analysis, Correlation analysis, Waste water(Pollution), Heated water, Water pollution, Maryland, Virginia, *Thermal pollution.
Identifiers: *Bay waters, *Calvert Cliffs nuclear powerplant, *Baltimore Harbor, Surface water temperature, Warming trend, Trends, Standard deviation, Probability of exceedence.

Now, while the Calvert Cliffs Nuclear Power Plant of the Baltimore Gas and Electric Company begins to discharge waste heat into the Chesapeake Bay near Scientists Cliffs, it is pertinent to establish a historical data base for use in judging possible long-term temperature effects of thermal plants on the waters of the bay. The longest, published, continuous time series of water temperature data pertaining to the Chesapeake Bay region is a 49-year record of daily surface water temperatures taken at Fort Henry in Baltimore Harbor by the U.S. Coast and Geodetic Survey from 1914 through 1962. The water temperature data was summarized in 1972. From that data it was learned that temperatures appeared to be increasing at a mean rate of 0.265 C per decade. It is pertinent to ask if surface waters in Baltimore Harbor have been responding slowly to cumulative thermal discharges from the four power plants located in the harbor. The apparent warming trend probably did not extend beyond 1962 according to subsequent observations. A study of a 95-year record of air temperature data pertaining to the Chesapeake Bay region showed that water temperatures and nearby air temperatures responded to the same or similar regional meteorological differences. At that time, the Calvert Cliffs Nuclear Power Plant began to discharge waste heat into Chesapeake Bay, so it was important to determine any previous trend in the harbor water temperature that could be ascribed only to man's activities. Apparently, no such tend could be determined. (Roberts-ISWS)

SPECTRAL CHARACTERISTICS OF THE MICROWAVE EMISSION FROM A WIND-DRIVEN FOAM-COVERED SEA,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
W. J. Webster, Jr., T. T. Wilheit, D. B. Ross, and P. Gloersen.
Journal of Geophysical Research, Vol. 81, No. 18, p 3095-3099, June 20, 1976. 4 fig, 3 tab, 16 ref.

Descriptors: *Microwaves, *Arctic, *Winds, *Oceans, *Remote sensing, Aircraft, Waves(Water), Fetch, Wavelengths, Investigations, Oceanography.
Identifiers: *Bering Sea, Microwave emission, Sea foam.

Aircraft observations of the microwave emission from the Bering Sea showed that the spectral character of brightness temperature variation with wind speed in a fully developed sea is due to a combination of surface roughness and a surface layer with varying dielectric constant over a physical depth of a few millimeters. The varying dielectric layer is identified with cusps formed by the bubbles associated with thin foam streaks. Computations of the radiative transfer through such a layer showed that the change in microwave emissivity due to the presence of that layer decreases as microwave wavelength increases. Since foam streak coverage on the ocean surface increases with surface wind speed, the increase in microwave brightness temperature with increasing wind speed will be less at longer wavelengths, a characteristic that is observed in the experimental results presented. In addition, it was observed that in fetch-limited situations the microwave brightness temperature depends in the same way on surface wind speed but is essentially independent of varying foam coverage, the implication being that the surface wave structure becomes more important in determining the microwave brightness temperatures as fetch approaches zero. It appears that microwave brightness temperatures are directly related to ocean surface wind speeds, regardless of fetch. (Sims-ISWS)
W77-02476

THE EFFECT OF THE GEOSTROPHIC FLOW UPON COASTAL SEA ELEVATIONS IN THE NORTHERN NORTH PACIFIC OCEAN,
Scripps Institution of Oceanography, La Jolla, Calif.
J. L. Reid, and A. W. Mantyla.
Journal of Geophysical Research, Vol. 81, No. 18, p 3100-3110, June 20, 1976. 15 fig, 36 ref.

Descriptors: *Sea level, *Water levels, *Pacific Ocean, *Subarctic, Water level fluctuation, Circulation, Water circulation, Seasonal, Coasts, Atmospheric pressure, Currents(Water), Ocean currents, Ocean circulation, Oceanography.
Identifiers: Steric heights, Gyres.

Coastal sea elevations measured at tide gages in the northern North Pacific when adjusted for the atmospheric pressure show a seasonal high in winter (November-February). This high is well out of phase with the mid-ocean response of geopotential anomaly (steric height) to the heating and cool-

U. OF I. URBANA-LIBRARY

ing cycle which produces highest steric elevations in JulybOctober. This paper reported an attempt to show that steric height near the coast varies seasonally in phase with the measurements at the tide gages and that the high elevations in winter are a consequence of the circulation of the subarctic cyclonic gyre of the North Pacific Ocean. The flow of the coastal limb of this gyre (along the eastern, northern, and western boundary of the ocean) is intensified in winter, and in geostrophic balance the sea surface slopes upward toward the coast, accounting for the winter rise. Sea elevation along the eastern boundary as determined from steric height does not slope uniformly downward from the equator toward higher latitudes but has several maxima and minima. These appear to be the consequence of the sea surface slopes associated with the quasi-geostrophically balanced system of cyclonic and anticyclonic gyres in middle and high latitudes and zonal flows near the equator. RARE EARTH ELEMENT SUPPLY TO THE OCEAN,
Ecole Normale Superieure, Paris (France). Laboratoire de Geologie.
J-M. Martin, O. Hogdahl, and J. C. Philippot
Journal of Geophysical Research, Vol. 81, No. 18, p 3119-3124, June 20, 1976. 4 fig, 3 tab, 47 ref.

Descriptors: *Suspended solids, *Sediments, *Oceans, *Rivers, Dissolved solids, Geochemistry, Chemical analysis, Erosion, Foreign countries, Sedimentology, Oceanography.
Identifiers: *Rare earth elements, *Amazon River, *Congo River, *Ganges River, *Mekong River, *Gironde estuary(France), Sediment sources.

More insight on rare earth element pathways from land to ocean came from analyses of suspended matter in four major world rivers (Amazon, Congo, Ganges, Mekong), while their geochemical behavior at the river-ocean boundary was studied in the Gironde estuary (France). The Gironde data indicated that soluble rare earth elements are removed from solution in the estuarine zone; this observation invalidates any rare earth element balance to the ocean which would not take into account the river-ocean boundary processes. Data on rare earth element concentrations in soluble and detrital river loads showed that solid discharge represents the major part of rare earth elements supplied by rivers to the ocean. A rare earth material balance to the ocean was discussed on the basis of the results presented in this paper. (Sims-ISWS)

USE OF LANDSAT DATA FOR NATURAL RESOURCES INVESTIGATION IN THE LOWER BASIN OF DANUBE AND DANUBE DELTA,
Institutul de Constructii din Bucuresti (Rumania). Lab. for Remote Sensing.
N. Oprescu.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-20605, Price codes: A02 in paper copy, A01 in microfiche. Report NASA-CR-146631, December 1975. 12 p, 1 tab.

Descriptors: *Remote sensing, *Rivers, *Sediments, Satellites(Artificial), Data processing, Water resources, Water quality, Runoff, Sedimentation, Eutrophication, Deltas, Foreign countries, Pollutant identification.
Identifiers: *LANDSAT, *Romania, *Danube River, Danube delta.

Due to the delay in the receipt of data, the program of the investigation developments had to be revised. Also, meteorological conditions were unfavorable, thus the accomplishment of the concordance between airborne and space recordings during periods of utmost interest for investigation was impeded. However, the recordings on bands 4 and 5 very clearly showed the sedimentary discharge in sea water at the mouth of the Danube while recordings on bands 6 and 7 showed the successive stages of the evolution of the Danube Delta, clearly marking the separation of the fluvial delta from the marine delta. AN EFFECT OF PERMEABILITY ON SAN TRANSPORT BY WAVES,
National Bureau of Standards, Washington, D. C. Inst. for Basic Standards.
K. E. B. Lofquist.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as AD-A0[illegible] 641, Price codes: A04 in paper copy, A01 microfiche. Report of Army Corps of Engineer Ft. Belvoir, Va., Coastal Engineering Researc Center, Technical Memorandum No. 6 December 1975. 74 p, 20 fig, 19 ref, 2 append.

Descriptors: *Waves(Water), *Sand *Permeability, Sand waves, Ripple mark Laboratory tests, Model studies, Coasts, Beache Coastal engineering.
Identifiers: *Sand transport, Permeability effect Ripple profiles, Coastal processes, Oscillato flow.

Permeability effects on the movement of sand oscillatory flows were observed in laboratory e periments which approximate prototype con tions at the seabed under progressive waves. natural sand was used, wave periods rang between 3 and 14 seconds, and sand surfaces we naturally rippled. The apparatus had a symmet which removes all effects, except those permeability, which might cause a net moveme of sand. Onshore and offshore directions we determined by phase relationships between t horizontal flows and superposed vertical perme bility flows. A positive permeability effect w found in that the ripple profiles move in t onshore direction. The velocity of this motion w measured and described in a simple, dimensionl plot. The associated net transport of sand was n observed directly but can be inferred, to an exte from the motions of the ripple profiles. The effe of permeability are cumulative and can be sign cant in coastal processes of long duration. A estimate of the local rate of sand transport onsh due to permeability involves the distribution permeabilities within the seabed which are larg unknown. An overall estimate is less than 1 cu meter per meter of shoreline per year, which negligible for most engineering consideratio (Sims-ISWS)

3A. Saline Water Conversion

PROSPECTS FOR AN AGRO-INDUSTRIAL COMPLEX ON THE GAZA-SINAI SEA COAST,
State Univ. of New York at Buffalo.
J. Haupert.
Ecumene, Vol. 7, p 21-24, February, 1975. 1 fig, 9 ref.

Descriptors: *Water costs, *Water resources development, *Potential water supply, *Water supply, *Desalination, Arid lands, Nuclear powerplants, Irrigation, Costs, Industrial plants, Agronomic crops, Fertilizers, Deserts, Land use, Human population, Water shortage.
Identifiers: *Gaza-Sinai sea coast region.

In the Gaza-Sinai sea coast region any industrial or agricultural development is dependent upon an adequate water supply. The prospects for such development and its effect on water resources are discussed. About forty-five percent of the arable land in the Gaza is presently irrigated, mainly from wells. Some water is available from winter rains. The alternative to these water resources is desalination which would require sizeable amounts of power. The use of nuclear power and oil and gas is evaluated. One alternative is to construct a large agro-industrial complex that would not only produce and utilize desalinated water, but which could contribute low cost chemical fertilizers for use in the area. The obvious disadvantage of such a project is the cost. Two desalination plants capable of producing 250 million gallons of fresh water per day would require an investment of at least $400 million. In addition to the cost of water, the types of crops that might be grown and the industries constructed are discussed. (Jamail-Arizona)

DESALINATION TO PLAY A MAJOR PART IN MIDDLE EAST WATER SUPPLY.
Water Services, Vol. 80, No. 960, p 92,94, February, 1976.

Descriptors: *Desalination, *Desalination plants, *Desalination apparatus, *Water purification, *Desalination processes, Potable water, Water supply, Water resources, *Water treatment, Water quality, Distillation, Water quality, Water softening, Water sources, Water resources development, Water supply development, Water demand.
Identifiers: *Middle East, Qatar.

With Middle East countries devoting a large part of their oil revenues to building modern industrial infrastructures and improving living standards generally, the demand for pure water is growing rapidly. Scarcity of water in the Middle East is likely to lead to reliance upon desalination plants to meet water demands, and desalination as a possible water source for drinking and industrial needs is discussed. In the area, most desalination plants work by distillating sea water. The design of plants being constructed in Qatar is discussed. Each of the plants will be capable of producing four million and five million gallons of fresh water per day depending upon the method utilized. The operation of the plants, which are part of an extensive program of development and industrialization being conducted by the government of Qatar, is discussed. (Jamail-Arizona)

WATERSHED MANAGEMENT'S EFFECTS ON MANY RESOURCES,
Arizona Univ., Tucson. School of Renewable Natural Resources.
P. F. Ffolliott, and D. B. Thorud.
In: 19th Annual Arizona Watershed Symposium Proceedings, Report No. 7, p 39-42, September 1975. 11 ref.

Descriptors: *Watershed management, *Arizona, *Water yield improvement, *Resources development, Vegetation effects, Coniferous forests, Ponderosa Pine Trees, Forest watersheds, Forest management, Chaparral, Soil-water-plant relationships, Wildlife management, Canopy, Livestock.

An overview is presented of water yield improvement research as evaluated in terms of multiple use management and emphasizing conifer forests, ponderosa pine forests. and chaparral shrub zones. Results suggest that vegetation management has the potential for increased water yield, while maintaining or enhancing the production and use of associated natural resources and minimizing the destruction of on-site soil resources. The three vegetation zones highlighted are believed to have the greatest potentials for increasing water yield through vegetation management. Tests on those vegetation zones are described, with experimental watersheds in different areas showing improved water yield. Clearing or thinning of vegetation overstories in conifer and ponderosa pine forests to improve water yield is also consistent with primary wood harvesting activities. Herbage production is generally increased, with a resultant increase in potential livestock carrying capacities. Wildlife response in experimental watersheds suggests an improved habitat by opening up dense brush, thereby increasing ease of movement and abundance of forage. Esthetic and soil responses to vegetation management are also discussed. (See also W77-02104) (Jahns-Arizona)
W77-02109

WOODS CANYON--A LARGE SCALE WATERSHED MANAGEMENT EXPERIMENT: AN EXPLANATION AND INTERIM REPORT,
Forest Service (USDA), Flagstaff, Ariz. Rocky Mountain Forest and Range Experiment Station.
D. R. Carder.

In: 19th Annual Arizona Watershed Symposium Proceedings, Report No. 7, p 43-46. September, 1975. 1 tab, 8 ref.

Descriptors: *Watershed management, *Forest management, *Water yield improvement, *Demonstration watersheds, *Arizona, Vegetation effects, Surface runoff, Land use, Wildlife management, Pine trees.
Identifiers: *Woods Canyon(Ariz), *Beaver Creek(Ariz).

Progress is reported on the watershed management experiment being conducted at Woods Canyon, a 10,700 acre watershed located within the Beaver Creek watershed south of Flagstaff, Arizona. Studies were undertaken to learn whether modification of vegetation could produce more water in the Salt-Verde River Basin; ponderosa pine and pinyon-juniper vegetation in the Beaver Creek watershed account for 60% of the total Basin runoff. Woods Canyon and a control site are described and the objectives of the experiment outlined along with a land use plan being formulated. Major management alternatives considered for the pine lands in the Woods Planning Unit are discussed. One alternative emphasizes primary wood production on an even flow basis over the entire area. The second alternative stresses equally the production of timber and the maintenance and improvement of big game habitat. The third involves retaining natural conditions and esthetics while preserving commodity production on some of the more productive soils. The fourth alternative stresses water yield and livestock forage. Potential effects on water yield for each approach are analyzed; alternative four promises the greatest yield of both forage and water. (See also W77-02104) (Jahns-Arizona)
W77-02110

CHAPARRAL MANAGEMENT: ITS POTENTIAL--ITS PROBLEMS--ITS FUTURE,
Forest Service (USDA), Tempe, Ariz. Rocky Mountain Forest and Range Experiment Station.
J. H. Dieterich.
In: 19th Annual Arizona Watershed Symposium Proceedings, Report No. 7, p 47-51, September, 1975. 1 fig, 15 ref.

Descriptors: *Chaparral, *Range management, *Southwest U.S., *Arizona, *Water yield improvement, Land clearing, Burning, Land use, Environmental effects, Chemcontrol, Herbicides.
Identifiers: *Chaparral management.

Various approaches are discussed to chaparral management in the Southwest, especially in Arizona. The amount of land meeting criteria for active management must be ascertained. Other considerations include environmental effects, potentials for increasing water yield, forage production and recreational opportunities, and methods for reducing fire suppression costs in chaparral areas. Conversion of 21% of the chaparral could increase Arizona's yearly water supply by an average of 150,000 acre feet (2% of the total). Other possible effects of conversion are described, including increased erosion. Chaparral can be controlled or eliminated mechanically by rootplowing, prescribed burning, and with herbicides; the costs and effectiveness of each method and some management alternatives are analyzed. Management by protection is still the main approach but is inadequate; one problem is the lack of financing for large-scale conversion and maintenance operations. Another problem involves finding an effective and environmentally acceptable chemical for initial treatment and maintenance on chaparral watersheds. More intensive management in the future is likely, and continued research will be necessary. Some possible directions of research are discussed. (See also W77-02104) (Jahns-Arizona)

DROUGHT HAZARD IN THE UNITED STATES: A RESEARCH ASSESSMENT,
Colorado Univ., Boulder. Inst. of Behavioral Science.
R. A. Warrick, P. B. Trainer, E. J. Baker, and W. Brinkman.
NSF Program on Technology, Environment and Man, Monograph NSF-RA-E-75-004, 1975. 199 p, 41 fig, 11 tab, 171 ref, 1 append

Descriptors: *Droughts, *Water shortage, *Water demand, *Water conservation, Agriculture, Water resources, Water reuse, Desalination, Precipitation(Atmospheric), Rainfall, Moisture deficit, Water supply, Irrigation, Climatology, Meteorology, Weather forecasting.
Identifiers: *Agricultural drought, *Urban drought.

An overview of droughts, their causes and effects, is presented. The main focus is drought hazard, determined by the degree to which urban or agricultural demands are over-extended in relation to a highly variable resource, precipitation. Unlike floods and most other geophysical hazards which have a relatively quick onset and short duration, drought is a creeping phenomenon. It is often difficult to ascertain when a drought begins, and when it ends. The question of whether or not an extended dry spell has, in fact, become a drought causes considerable debate among meteorologists, farmers and public officials. The report is divided into two main sections: agricultural drought and urban drought. In each section the factors used to determine drought are discussed. It is concluded that during the past twenty years research emphasis has been on the technical aspects of increasing water supply and on weather modification programs. More research should be conducted on reducing water demand and investigating water reuse programs, desalination, and other water saving devices. (Jamail-Arizona)

EFFECT OF ABSCISIC ACID AT DIFFERENT LEVELS OF SOIL WATER POTENTIAL ON THE TRANSPIRATION OF ZEA MAYS,
Aarhus Univ. (Denmark). Inst. of Plant Physiology.
M. Talha, and P. Larsen.
Physiologia Plantarum, Vol. 37, No. 2, p 104-106, 1976. 1 fig, 11 ref.

Descriptors: *Evapotranspiration control, *Soil water, *Corn(Field), *Moisture stress, *Moisture deficit, Arid lands, *Transpiration, Soil moisture, Soil surfaces, Soil types, Soil water movement, Soil-water-plant relationships, Moisture content, Evapotranspiration, Water loss, *Acids, *Antitranspirants, Water yield improvement.
Identifiers: *Abscisic acid.

In previous attempts to reduce evapotranspiration, chemical antitranspirants in solution have been applied to leaf surfaces. Recently, the capability of abscisic acid in reducing transpiration was demonstrated in a number of plant species but none of these works dealt with the effect of exogenous abscisic acid under conditions of soil moisture deficit, which usually prevail in arid regions. In this study, experiments were conducted to demonstrate the effect of abscisic acid on transpiration at different levels of soil water potential. This relationship upon corn leaves was studied in growth chamber experiments. Preliminary results seem to indicate that abscisic acid could serve as an efficient antitranspirant at certain intermediary soil water potentials. Further research is needed to determine the optimum and most economic concentration of abscisic acid or some other compound as an antitranspirant for various plant species grown in different types of soil with different water potentials. (Jamail-Arizona)
W77-02121

ECOLOGICAL IMPACTS OF SNOWPACK AUGMENTATION IN THE SAN JUAN MOUNTAINS OF COLORADO.
Colorado State Univ., Fort Collins. Coll. of Forestry and Natural Resources.
Report No. CSU-FNR-7052-1, March 1976. 501 p. Steinhoff, H.W., and Ives, J.D., editors. USBR 14-06-D-7052.

Descriptors: *Colorado, *Ecology, *Snowpacks, *Environmental effects, *Weather modification, Mountains, Snow, Environment, Phenology, Geomorphology, Plant growth, Productivity, Small animals(Mammals), Big game, Mammals, Forests, Oak trees, Coniferous trees, Silver iodide, Cloud seeding, Climates, Fescues, Tundra, Alpine, Growth stages.
Identifiers: *San Juan Mountains(Colo).

Effects were studied of varying snowpack on the ecosystems of the San Juan Mountains in Colorado from 1970 to 1975. Initiation of shoot elongation was delayed for plants in the tundra and forests as a result of lower temperatures associated with deeper snowpack. The delay was most apparent for herbaceous species, such as Thurber fescue, whose growth points lay in the immediate zone of lower temperature at ground level. The effect on trees such as Engelmann spruce and quaking aspen was less. The result was a decrease in biomass production of herbaceous species, but not of trees or of Gambel oak, which was found in a zone that became snow clear very early. The delay in beginning of growth persisted through the other stages of the annual cycles of most plants but with less magnitude. There seemed universally a compensation factor which permitted each species to compress its annual cycle in years with a shorter growing season caused by greater depth of snowpack. Phytosociological studies in both forests and tundra showed that plant communities were arranged along a snow clear date gradient. In the forest, Gambel oak gives way to quaking aspen, then to subalpine fir, and finally to Engelmann spruce, as the snow clear date extends later into the year. A noticeable decline in forest populations of deer mice and, to a lesser extent, chipmunks and Microtus spp., followed winters of heavy snowfall. The basic reason was a delay in breeding and in availability of essential foods. No similar effect was found for the pocket gopher or mountain toad. Elk were almost excluded from regions with more than 70 cm of penetrable snow depth, and their travel was noticeably restricted at depths over 40 cm. Movement of elk to higher elevations in spring coincided with the initiation of growth of herbaceous plants rather than directly with the receding snow line, and adequate calving areas were always present. Plant litter in the tundra decreased in areas of deeper snowpack. Local changes in the rate of soil erosion may increase by a factor of 10 as a result of the greater area of bare soil left by the decrease in vegetative cover around snowbanks. No significant increases in silver concentration were detected, because of the small amounts added in cloud seeding and the high background levels of silver in the target area. No deleterious effects of silver iodide have been found at concentrations which could be expected due to cloud seeding. (Humphreys-ISWS)

ECONOMIC IMPACTS OF WEATHER VARIABILITY,
Missouri Univ., Columbia. Dept. of Atmospheric Science.
J. D. McQuigg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 349, Price codes: A12 in paper copy, A01 in microfiche. Report No. NSF-RA-3-75-125, August 1975. 263 p, 13 fig, 12 tab, 285 ref, 2 append. GI 137218X, ESR73-07752-A01.

Descriptors: *Weather, *Bibliographies, *Abstracts, *Weather modification, Agriculture, Crop response, Crop production, Energy, Forest fires, Public health, Recreation, Construction, Farm equipment, Transportation, Water utilization, Economics, *Economic impact.

Selected interactions between weather and weather-sensitive activities are summarized quantitatively in this compendium designed to assist weather modification project managers. Weather dependent relationships examined are: (1) agriculture, emphasizing wheat, corn, soybeans, grain sorghum, flax, oats, rye, barley, rice, and sugar beets, (2) forest fires, (3) energy demand and alternative energy sources, (4) outdoor activities, including construction, farm machinery, transportation, and recreation, and (5) health and disease effects on humans, farm animals, and crops. Most of the material concerning these interactions deals with direct meteorological impacts; the physical or biological impacts of weather on various enterprises. Also included is a section on the indirect impact of weather, the economics of non-agricultural water usage. These annotated bibliographies are followed by a brief discussion of the use of principal components estimators in multivariate regression, and state wheat yield models. Both an author and subject index are included. (Luedtke-Wisconsin)

INADVERTENT WEATHER MODIFICATION,
Illinois State Water Survey, Urbana.
S. A. Changnon, Jr.
Water Resources Bulletin, Vol. 12, No. 4, p 695-718, August 1976. 7 fig, 6 tab, 52 ref.

Descriptors: *Weather modification, *Cities, *Precipitation(Atmospheric), *Clouds, Weather, Urbanization, Industries, Smoke, Rainfall, Temperature, Humidity, Thunderstorms, Hail, Rain, Urban runoff, Urban hydrology, Climatology, Meteorology.
Identifiers: *Inadvertent weather modification, Urban effects, Visibility.

Man, through modifications of the biosphere, has been affecting the atmosphere on local and regional scales for many years. These alterations have been produced by urban industrial centers, non-urban industrial centers, land use changes in rural areas (deforestation, crop changes, drainage, etc.), and marine areas. Also, a major means whereby man has affected weather has been through his urban environment. More intensively than any other comparable-sized part of the earth's surface, cities are converters of energy and matter, thus directly affecting the heat budget, moisture budget, and exchange of mass in the atmosphere. Consequently, the changes in weather wrought by urbanization encompass all major surface weather conditions. The list of elements or conditions affected includes the contaminants in the air, solar radiation, temperature, visibility, humidity, wind speed and direction, cloudiness, precipitation, atmospheric electricity, severe weather, and certain mesoscale synoptic weather features. This paper specifically addressed the subject of urban-industrial effects on clouds and precipitation in the United States. What has been studied and claimed, as shown by climatic research and limited field experiments, was reviewed first. The scientific controversies related to this subject were treated and then followed by a discussion of the apparent impact and relevance of the changes in precipitation conditions. The summary of the paper identified the key problems. (Sims-ISWS)

Journal of the Atmospheric Sciences, Vol. 33, No. 10, p 1989-1994, October 1976. 5 fig, 3 tab, 6 ref.

Descriptors: *Nucleation, *Cloud seeding, *Cloud physics, *Ice, Crystals, Chemistry, Silver iodide, Salts, Laboratory tests, Molecular structure, Hail, Clouds, Precipitation(Atmospheric), Weather modification, Meteorology.
Identifiers: *Molecular studies, Hail suppression.

The objective of the present study was to determine the nature of ice-forming capabilities of different chemical compounds whose effectiveness is determined by the character of the forces binding water molecules to the surface of the compound. Adsorption layers of water and ammonia on the salts of silver and lead were studied. Dependence between the surface properties and ice-forming capabilities of the chemical compounds was investigated. Direct molecular structural analysis by infrared spectroscopy and nuclear-magnetic resonance was used in the studies. An active nucleus whose surface stimulates the water-to-ice phase transition for water molecules condensed on it must have a hydrophobic matrix with open structure and centers capable of interacting with water molecules. There seems to be two reasonable ways of artificially modifying a surface with the objective of stimulating the water-to-ice phase transition of condensed water: (1) contamination of the hydrophobic surface with active centers, which can interact with water molecules, or (2) suppression or removal of part of the active centers of a hydrophilic surface. (Sims-ISWS)

VEGETATION AND SOIL OF SALINE DEPRESSIONS NEAR NAJAF, CENTRAL IRAQ,
Baghdad Univ., (Iraq). Dept. of Botany.
H. Abul-Fatih.
Vegetatio, Vol. 30, No. 2 p 107-115, 1975. 7 fig, 2 tab, 19 ref.

Descriptors: *Saline lakes, *Soil moisture, Plant groupings, Soil types, Salinity, Saline water, Vegetation, Root systems, Deserts, Arid lands, Plant growth, Desert plants, Soil-water-plant relationships.
Identifiers: *Iraq, Iraqi deserts.

The vegetation of saline depressions in the Iraqi deserts has remained almost entirely unexplored. A study was conducted to describe and analyze the saline depression of Bahr-al-Najaf with the following objectives: (1) to distinguish and characterize the plant communities in the area and their distribution, (2) to relate the distribution to selected soil parameters, and (3) to study the physiognomy and root systems of some selected dominant plant species and relate these to soil moisture and salinity. The results are presented. Active plant growth occurs in the summer. Plant distribution is determined by a gradient in salt and water content. Root systems seem strongly correlated to the depth of subsoil moisture. The relationships between plant distribution and salt and water regime are relatively similar to those found in other parts of the Mediterranean region. (Jamail-Arizona)

Identifiers: *Abu Dhabi, Waste heat.

New ways need to be found to increase productivity of land available for farming. In Abu Dhabi, agricultural crops are being produced from one of the least arable lands on earth. Desalted water, distilled with waste heat captured from generators, is used to irrigate vegetables inside plastic covered greenhouses. The concept was tested at Puerto Penasco, Mexico. This article explains the process and evaluates the results. Crop production has been high, but costly greenhouse construction

U. OF I. URBANA-CHAMPAIGN

makes the concept practical only for high-value crops. (JamailsArizona)

SODIUM RELATIONS IN DESERT PLANTS: 5. CATION BALANCE WHEN GROWN IN SOLUTION CULTURE AND IN THE FIELD IN THREE SPECIES OF LYCIUM FROM THE NORTHERN MOJAVE DESERT,
California Univ., Los Angeles. Lab. of Nuclear Medicine and Radiation Biology.
R. T. Ashcroft, and A. Wallace.
Soil Science, Vol. 122, No. 1, p. 48-51, 1976. 4 tab, 6 ref

Descriptors: *Desert plants, *Saline soils, Sodium, Cations, Deserts, Soil types.
Identifiers: *Mojave Desert.

Lycium (wolfberry or desert thorn) is an indicator of saline conditions of the soils of the northern Mojave Desert. Three Lycium species were grown in nutrient solutions with varying sodium levels to determine if the differential responses to cations in the field were reproducible in the greenhouse. In spite of the differences in amounts of cations supplied in the nutrient solutions, the same trend in leaf concentrations as exhibited by field plants held remarkably well for each of the three cations of the three species. Root and leaf analysis indicate that L. andersonii is a poor accumulator of sodium and that the other two Lycium species transport sodium to shoots rather than retain it in roots. A high level of sodium chloride in the nutrient substrate resulted in increased total cations in all three species. There was no relationship in total cation content of the plants with total contents of sodium + potassium + chloride. In whole plants collected from the field, high cation concentrations in leaves were related to differential distribution among plant parts for the three species so that leaf differences were compensated for without differences on the whole plant basis. ENVIRONMENTAL IMPLICATIONS OF N FIXATION BY SOYBEANS,
Illinois Univ. at Urbana-Champaign. Dept. of Agronomy.
J. W. Johnson, L. F. Welch, and L. T. Kurtz.
Journal of Environmental Quality, Vol. 4, No. 3, 1975. p 303-306, 3 fig, 2 tab, 7 ref.

Descriptors: *Nitrogen, *Nitrogen fixation, *Soybeans, Crop production, Corn(Field), Crop response, Fertilizers, Fertilization, Nutrients, Nutrient removal.

The objective was to measure inorganic N removal from soil by soybeans grown at different N levels. Nodulating and non-nodulating isolines of 'Clark' soybeans were planted on Flanagan silt loam in 1972 and 1973. Fertilizer rates of 0, 112, 224, and 448 kg N/ha as Ca(NO3)2 enriched with 1% 15N were applied. Symbiotically fixed N decreased from 48 to 10% of the total N in the above-ground plant as applied fertilizer N increased from 0 to 448 kg/ha. Net removals of N by soybean grain were 61, 109, 135, and 149 kg/ha at 0, 112, 224, and 448 kg fertilizer N/ha rates, respectively. Corn grain grown on adjacent plots removed 62, 123, 129, and 133 kg N/ha at fertilizer N rates of 0, 112, 224, and 336 kg/ha, respectively. The study indicates that soybeans are good scavengers for inorganic N in soils.(Skogerboe-Colo St)

WATER REQUIREMENTS FOR SOLAR ENERGY,
Arizona State Univ., Tempe.
C. E. Backus, and M. L. Brown.
American Water Works Association, Journal, Vol. 68, No. 7, p 366-369, July, 1976. 8 fig, 13 ref.

Descriptors: *Water requirements, *Available water, *Energy conversion, *Solar radiation, *Water utilization, *Water allocation(Policy), Water management(Applied), Electric power, Powerplants, Water, Natural resources, Competing uses, Consumptive use, Evaporation, Water supply, Runoff, Cooling water, Energy.
Identifiers: *Solar energy.

Like many of the systems that convert traditional energy sources into more useful forms, some that convert direct solar energy require water, usually for cooling. The use of several forms of energy for converting solar energy and their water requirements are discussed and evaluated. Of the many proposed applications for solar energy use, electric power generation is the one expected to require the largest amounts of water. Some thermal plants also require significant amounts of water, while the photovoltaic plants require no water. The inter-dependence of insolation and water availability is a factor in determining the type of solar power plant that is feasible in a given area. Maps compare the mean annual runoff and groundwater supplies with the mean daily total or direct insolation, when there is nothing such as dust or water vapor between the sun and the collector. Cooling method and mechanisms are evaluated and projections regarding the use of solar energy are given. (Jamail-Arizona)

THE COPPER INDUSTRY AND WATER IN ARIZONA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
L. A. Snow.
Master of Science Thesis, 1976. 81 p, 8 fig, 16 tab, 42 ref, 1 append.

Descriptors: *Copper, *Overdraft, *Industrial water, *Mine water, *Water demand, Water utilization, Competing uses, Water policy, Water allocation(Policy), Water resources, Water conservation, Water requirements, Water users, Groundwater availability, Water management(Applied), Groundwater mining, Groundwater resources, *Arizona, Mining, Groundwater.

Two of Arizona's most important natural resources are copper and water. The water requirements of the copper industry in Arizona are discussed and evaluated. Copper deposits are located in areas with little or no surface water, which has resulted in the exploitation of groundwater resources. As a result, many areas of the state are experiencing groundwater overdraft. The copper industry's water requirements are expected to increase over the next 10 to 20 years and the impact on the state's water resource is discussed. In order to deal with this situation, conservation measures must be adopted. The various conservation methods available to reduce the copper industry's new water requirements, a comprehensive water plan, land use regulation strategies, and taxing schemes are presented. Various water saving devices that might be employed by the copper companies are also discussed. The most important measures would be the use of sewage effluents in mining and processing copper. However, for the long run, a comprehensive water plan must be developed at the state level. (Jamail-Arizona)

Identifiers: *Prawns, Freshwater prawns, *Malaysian prawns, Giant malaysian prawns, Macrobrachium species, Macrobrachium rosenbergii, Juvenile prawns, Prawn diseases, Prawn culture, Crustacean culture, Prawn fisheries, Shrimp industry.

This publication is a summary of proceedings, augmented by material from other sources, of the Workshop on the Culture of Freshwater Prawns held November 25 and 26, 1974, in St. Petersburg, Florida. This publication has two main purposes: to summarize the state of development, in the United States, of aquaculture of the freshwater prawn, with particular emphasis on the long-legged giant Malaysian prawn, Macrobrachium rosenbergii; and to begin compilation of institutions, companies, and persons engaged in some aspect of prawn research and culture so that communication among persons and organizations with comparable interests may be accelerated. Some of the areas covered in the report are: Malaysian prawn breeding, juvenile prawns, feeding cultured prawns, diseases of freshwater prawns, prawn culture systems, proceeding and marketing of prawns, and the economics of prawn culture. MAXIMIZING STOMATAL CONTROL AND ROOT SYSTEM TO OPTIMIZE WATER-USE EFFICIENCY IN SOYBEANS,
Kansas Water Resources Research Inst., Manhattan.
I. D. Teare.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 395, Price codes: A05 in paper copy, A01 in microfiche. Completion Report, KWRRI Contribution No. 180, (1976). 100 p. OWRT A-060-KAN(1). 14-34-0001-6017.

Descriptors: *Soybeans, Soil water, *Stomata, *Root systems, *Root distribution, Root development, Soil profiles, Sorghum, Soil moisture, Irrigation practices, Plant growth.
Identifiers: Available soil water, Soil water potential, Leaf water potential, Leaf area index, Physiological stage, Dry matter, Stomatal resistance, *Nitrate reductase activity.

Soybean and grain sorghum roots have been studied in relation to rate of root extention, rooting depth, dry matter distribution in the soil profile, soil water use and flux, and physiological stages of development under irrigated and nonirrigated conditions. Soybean roots reached a depth of 160 cm in a barrier-free soil 15 1/2 weeks after planting date in both irrigated and nonirrigated treatments. A greater proportion of nonirrigated soybean roots were at deeper depths than the irrigated sorghum roots. Sorghum roots reach maximum depth (150 cm) much quicker than soybean roots (7 weeks after planting date). Soil moisture inventories showed that sorghum conserves soil moisture early in the season, a phenomenon related to stomatal resistance. Soybeans, on the other hand, transpire more water and extract more water from the soil than grain sorghum. The greater negative flux of water in soybeans late in the season helps explain their using more water than sorghum. Stomatal resistance values of 8 to 10 sec/cm occur after nitrate reductase activity decreases and before photosynthesis is reduced, so stomatal resistance may be useful for scheduling irrigations in soybeans and sorghum.

DRIP IRRIGATION FILTRATION PROBLEMS AND RESEARCH,
Controlled Water Emission Systems, El Cajon, Calif.
D. L. Wilson.
Sprinkler Irrigation Association, 1975 Annual Technical Conference Proceedings, Hyatt-Regency Hotel, Atlanta, Georgia, February 23-25, 1975. p 51-57, 4 ref.

Descriptors: Irrigation water, Irrigation, Irrigation systems, Filtration, Filters, Water quality, *Irrigation practices.
Identifiers: *Drip irrigation, *Trickle Irrigation.

One of the major concerns in drip irrigation is filtration. Proper filtration makes the difference between an effective drip installation and one that is ineffective with many problems and poor efficiency. The drip filtration problem is examined and defined. Existing equipment and processes to treat the filtration requirement are reviewed. Some of the equipment and processes under development are discussed. (Skogerboe-Colo St)

DRIP IRRIGATION PROGRESS AND PROBLEMS,
California Univ., Parlier. San Joaquin Valley Agricultural Research and Extension Center.
F. K. Aljibury.
In: Sprinkler Irrigation Association, 1975 Annual Technical Conference Proceedings, p 46-47, Hyatt-Regency Hotel, Atlanta, Georgia, February 23-25, 1975.

Descriptors: Irrigation, Irrigation methods, *Irrigation practices, Water conservation.
Identifiers: *Drip irrigation, *Trickle irrigation.

Most drip irrigation installations in California and elsewhere, were made to solve specific problems of water cost, water shortage, soil conditions, labor expense and automated water delivery. The acceptance of this method would have been limited, however, without favorable crop response, production, and favorable costs. Field experience shows that drip irrigation is most advantageous under conditions marginal for other methods of water application. (Skogerboe-Colo St)

THE FUTURE OF AUTOMATED SPRINKLER IRRIGATION SYSTEMS,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
W. E. Splinter.
In: Sprinkler Irrigation Association, 1975 Annual Technical Conference Proceedings, Hyatt-Regency Hotel, Atlanta, Georgia, February 23-25, 1975. p 42-45, 8 ref.

Descriptors: *Sprinkler irrigation, *Automatic control, *Automation, Irrigation, *Irrigation practices, Irrigation efficiency.

Sprinkler irrigation, especially automated forms of sprinkler irrigation, will play a key role in supplying the U.S. with adequate food resources to meet the expanding demands internally and to provide diplomatic and balance-of-trade impact on the international scene. As menial labor to provide shovel work for irrigation becomes increasingly scarce, there will be continued pressures to increase initial investment to automate irrigation. (Skogerboe-Colo St)
W77-02092

IRRIGATION SCHEDULING FOR ENERGY AND WATER CONSERVATION,
Agricultural Research Service, Fort Collins, Colo.
D. F. Heermann.
In: Sprinkler Irrigation Association, 1975 Annual Technical Conference Proceedings, Hyatt-Regency Hotel, Atlanta, Georgia, February 23-25, 1975. p 7-13, 2 fig, 14 ref.

Descriptors: *Water conservation, *Energy, *Scheduling, Sprinkler irrigation, Surface irrigation, *Water conservation.
Identifiers: *Irrigation scheduling.

Many irrigation scheduling schemes have been developed to help the irrigator conserve water and increase yields. The more complex schemes have been shown to conserve considerable amounts of water and energy. However, even the simpler schemes must not be overlooked since they also are good management tools. The benefits of irrigated agriculture in food production will undoubtedly force continued irrigation development throughout the world. (Skogerboe-Colo St)

SPRINKLERS FOR MULTIPLE USE,
M. Hagood.
Irrigation Age, Vol. 9, No. 8, p 11-12, May-June 1975.

Descriptors: *Sprinkler irrigation, Irrigation, Irrigation systems, *Irrigation practices, Fertilization.

Multiple use for full utilization of natural resources has been popular for several years. The multiple use concept for irrigation systems can also be beneficial. Besides nonagricultural uses of sprinkler systems, there are many production aspects which provide potentially better utilization. These include the fertilizer, soil amendment and pesticide application, and climate control. And, although single line systems can be used for purposes other than irrigation, the real dividends come when systems are automated. Solid sets and center pivots, particularly, lend themselves to sophisticated and extra dividend benefits. Multiple purpose systems make it possible to save labor, material, and energy by requiring fewer trips across the field with machinery and by timely chemical application. (Skogerboe-Colo St)
W77-02095

A NEW TECHNIQUE FOR CONSERVING WATER,
A. Humpherys.
Irrigation Age, Vol. 9, No. 7, p 24-25, April 1975.

Descriptors: *Water conservation, Irrigation, Irrigation systems, Irrigation efficiency, *Irrigation practices.

As our knowledge of soils and plants increases and as we learn more about the effects of the field environment and cultural treatments on plant growth and production, we will need to modify present tillage, irrigation, and cultural practices to take advantage of new concepts. A practice getting recent attention consists of using short, frequent irrigations which vary from daily irrigations to irrigating every two or three days. (Skogerboe-Colo St)
W77-02097

COMPUTER IRRIGATION,
Irrigation Journal, Vol. 25, No. 5, p 14-15, September-October 1975.

Descriptors: Irrigation, Scheduling, Computers, *Computer programs, Irrigation practices, Colorado, Crop production.
Identifiers: *Irrigation scheduling.

When to irrigate and how much water to use on crops are decisions which will be made by computer during the current growing season for a test group of cooperating farmers in western and southeastern Colorado. The farmers are part of a computer-controlled irrigation program being conducted by the U. S. Interior Department's Bureau of Reclamation. Program Coordinator Jerry Buchheim is in charge of the project, which is monitored by the bureau's giant Control Data CYBER 74 computer at the Federal Center in Denver. (Skogerboe-Colo St)

OPTIMIZATION OF WATER USE EFFICIENCY UNDER HIGH FREQUENCY IRRIGATION--I. EVAPOTRANSPIRATION AND YIELD RELATIONSHIP,
New Mexico State Univ., University Park. Dept. of Agricultural Engineering.
T. A. Howell, and E. A. Hiler.
Transactions of the American Society of Agricultural Engineers, Vol 18, No 5, p 873-878, September-October 1975. 2 fig, 5 tab, 20 ref.

Descriptors: *Irrigation, *Irrigation efficiency, *Irrigation practices, Irrigation systems, *Evapotranspiration, *Crop response, *Grain sorghum, Irrigation effects, Lysimeters, Moisture stress, Water utilization.
Identifiers: High frequency irrigation, *Drip irrigation, *Trickle irrigation.

An experiment was conducted in 1973 to determine the sensitivity of grain sorghum to water deficits in three selected growth stages under high frequency irrigation. Field lysimeters containing undisturbed soil cores were utilized. Rainfall was removed as a variable by an automatic shelter system. Irrigation treatments consisted of a well-watered control, a variable level of deficit in all three growth periods (SDI treatment), and six additional treatments were irrigated three times per week. Measurements were made to determine irrigation amount, storage depletion, and drainage amount; hence total crop water use could be determined. Three empirical yield models (two multiplicative type and one additive type) were compared to the experimental data. All of these models were quite similar in formulation and represented the experimental data accurately within the range of the data. (See also W76-01083) (Skogerboe-Colo St)

EXPERTS CLING TO WATER MYTHS,
M. Muller.
New Scientist, Vol. 70, No. 1006, p 692-693, June 24, 1976.

Descriptors: *Irrigation practices, *Flood irrigation, *Furrow irrigation, *Irrigation systems, *Irrigation efficiency, Irrigation, Irrigation effects, Water policy, Clays, Root zone, Impervious soils, Soil moisture, Soil types, Social values, Agriculture, Rural areas, Planning, *Institutional constrainrs.
Identifiers: *Sudan.

Experts often cite peasants' conservatism as a barrier to rural improvements. However, in the Sudan the conservatism of the experts in the face of adaptability by peasant farmers now jeopardizes the success of a major new irrigation project. The irrigation procedures recommended by irrigation agronomists are compared with the ways in which local farmers have adapted their own traditional irrigation methods. The Gezira irrigation project has been very successful in increasing agricultural production, but there is conflict as to which is the most efficient system of irrigation for this region. The farmers use a system of continuous irrigation. Unsupervised flood irrigation is not highly regarded by experts, but the farmers have adapted their method to the predominant soil type. The clay soil cracks when dry, providing a path for moisture to penetrate the root zone. On saturation, swelling closes the cracks. Overwatering is immediately evidenced by flooding. This method has resulted in reducing the time necessary to irrigate. Even though the local farmers' method of irrigation may be more efficient, the procedures recommended by agricultural experts will be adopted by government planning agencies. (Jamail-Arizona)

WATER MANAGEMENT OF SHORT-SEASON HIGH-DENSITY COTTON,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
R. A. Mohammed.
Master of Science Thesis, 1975. 89 p, 1 fig, 4 tab, 36 ref.

Descriptors: *Water management(Applied), *Cotton, *Soil moisture, *Crop production, Fiber crops, Soils, Soil profiles, Soil water, Irrigation, Irrigation operation and maintenance, Arid lands, Moisture stress, Nitrogen compounds, Fertilizers.

Water management of cotton was studied for three seasons at the University of Arizona Experimental Farm near Tucson. Various irrigation schedules and nitrogen fertilizer application rates were examined, and data were collected on amounts of water applied, yield, boll, and fiber properties, soil nitrate levels and cotton petiole nitrate levels. Two varieties of cotton, Anderson-Clayton 1764 and Deltapine 16, were planted. Deltapine 16 was the only variety planted in 1973 and 1974. The 1972 experiment showed that Deltapine 16 was better suited to the short-season, high-density cotton production system than Anderson-Clayton 1764. The 1973 and 1974 experiments indicated that available soil moisture depletion should not exceed 50-55 percent. Also, criteria (based on available soil moisture) of when to irrigate should not be varied throughout the season. Results suggest that yields can be maintained with early irrigation termination if soil moisture, before irrigation, is kept at a higher level than is the normal practice. Application of 100 pounds of Nitrogen per acre seemed to adequately meet the crop's needs for the season. (Jamail-Arizona)

THE ECONOMICS OF PRESSURIZED IRRIGATION SYSTEMS FOR MATURE CITRUS ORCHARDS IN SOUTHWESTERN ARIZONA,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
P. Wilson, R. W. Fox, and G. S. Willett.
Publication No. 14, 1976. 76 p, 3 fig, 24 tab, 10 ref, 5 append.

Descriptors: *Citrus fruits, *Irrigation efficiency, *Irrigation systems, *Costs, *Irrigation practices, Irrigation districts, Irrigation operation and maintenance, Crops, *Arizona, Irrigation, Irrigated land, Furrow irrigation, Flood irrigation, Water quality, Water costs.
Identifiers: *Pressurized Irrigation Systems.

An economic comparison of alternative irrigation systems for mature citrus orchards in the Wellton Mesa area of Arizona is presented. Investments, operating costs, returns, liquidity and profitability of drip, bubbler and spray systems are analyzed relative to conventional flood irrigation. Data obtained through interviews with citrus producers in the area included crop yields, irrigation techniques utilized, inventory of irrigation facilities and equipment, amount and timing of fertilizer water applied, methods and materials used to control weeds, and labor requirements. Additional information on conventional flood irrigation was obtained from the University of Arizona, the Soil Conservation Service, and the Wellton-Mohawk Irrigation and Drainage District. Results indicate that pressurized irrigation systems are the most efficient: water is delivered to the root area of each tree in the quantity needed to sustain productive growth. The costs of installation and operation of this type of irrigation system are analyzed. (Jamail-Arizona)

INFLUENCE OF DIFFERENT WATER REGIMES ON OXYGEN DIFFUSION RATES, NUTRIENT UPTAKE, GROWTH AND YIELD OF WHEAT,
Indian Agricultural Research Inst., New Delhi.

A. K. Sharda, and J. P. Gupta.
Annals of Arid Zone, Vol. 14, No. 4, p 373-375, December, 1975. 1 tab.

Descriptors: *Soil moisture, *Moisture stress, *Moisture availability, *Moisture uptake, *Moisture tension, Stress, Tension, *Wheat, Nutrients, Root systems, Crop response, Crop production, Heat conductivity, Soils, Oxygen, Irrigation effects, Soil-Water-Plant Relationships, Aeration.

A pot culture experiment using Delhi sandy loam soil was conducted to study oxygen diffusion, nutrient utilization, growth and yield of wheat as affected by different water regimes. Soil moisture was maintained by irrigating the soil to field capacity. In each pot, four plants were maintained. Fertilizers were applied and periodic observations of height, number of tillers and leaf area were taken during the growth of the crop. Oxygen diffusion rate in the soil was measured. Results indicate an increase in oxygen diffusion rate with increase in soil moisture tension. it can also be inferred that under high moisture regime conditions where there is practically no moisture stress, the conditions are favorable for proper oxygen diffusion, nutrient availability, root and shoot growth and ultimately the yield of the crop. 'TUNING IN' SAVES WATER, BOOSTS YIELDS ON SANDY SOILS,
R. Ross.
Irrigation Age, Vol. 10, No. 3, p 18-20, November-December 1975.

Descriptors: Irrigation, Irrigation efficiency, Irrigation water, Sprinkler irrigation, Scheduling, Water conservation, Sands.
Identifiers: Center pivot irrigation, *Irrigation scheduling.

Any irrigator who can get more yield while using less water is on the right track to higher profits. Bill Condon, Sterling, Colorado rancher/farmer, has been in that desired position for three years. By using an irrigation scheduling program developed by Dr. Dale Heermann, and other Agricultural Research Service colleagues, stationed at Ft. Collins, Colorado, Condon has been able to get consistent yield increases (yields are now between 150 and 160 bushels of corn per acre). Water usage has dropped by about 6 inches per year, and that, says Condon, 'adds a year of life to a center pivot every 5 years because we save about 7 revolutions per year.' (Skogerboe-Colo St)

HERBICIDES AND SURFACE IRRIGATION-DO THEY MAKE A TEAM,
G. Schleicher.
Irrigation Age, Vol. 9, No. 5, p 42, February 1975.

Descriptors: *Herbicides, *Surface irrigation, *Furrow irrigation, Irrigation, Irrigation practices, Water pollution control.
Identifiers: *Center pivot irrigation.

Herbigation through center pivot sprinkler irrigation works; that's the consensus of a growing number of irrigation specialists and irrigating farmers who have put the concept to use on a surprising variety of crops. But what about the surface irrigator, the operator who uses gated pipe or an open ditch to deliver water to his fields. Can herbicides be applied as efficiently at ground level as they are through a sprinkler nozzle. The solution to these questions have been the target of several private and university studies in the last year or two. While conclusive results are still somewhat sketchy, it's beginning to look like surface herbigation may eventually take a place in the irrigating farmer's stack of management tools. INITIAL RELEASE OF NITROGEN FROM UREAFORM UNDER FIELD CONDITIONS,
Agricultural Research Organization, Bet-Dagan (Israel). Inst. of Soils and Water; Agricultural Research Organization, Bet-Dagan (Israel). Div. of Soil Chemistry and Plant Nutrition.
A. Hadas, U. Kafkafi, and A. Peled.
Soil Science Society of America Proceedings, Vol 39, No. 6, p 1103-1105, November-December 197 3 fig, 2 tab, 10 ref.

Descriptors: *Nitrogen, *Nitrites, Nutrients, Crop response, Fertilizers, Fertilization, Ureas, Mineralogy.
Identifiers: *Bananas, *Ureaform.

The mineralization of ureaform in the soil has been observed during the three weeks following application in a small plot of a banana plantation at two different seasons of the year. In the cooler season ammonium and nitrite accumulated and persisted for 2 weeks. In the warmer season, only ammonium accumulated during 2 days. The rate of mineralization, calculated as a first-order reaction, was greater at the higher temperature, but the rate constants were about 10 times greater in the field than in previous laboratory experiments. The reasons for this are probably changes in microbiological activity and mineralization of nitrogen from sources other than the fertilizer. (Skogerboe-Colo St)
W77-02279

CROP PRODUCTION FUNCTION DETERMINATIONS AS INFLUENCED BY IRRIGATION AND NITROGEN FERTILIZATION USING A CONTINUOUS VARIABLE DESIGN,
North Dakota State Univ., Fargo. Dept. of Soil Science and Biometerology.
J. W. Bauder, R. J. Hanks, and D. W. James.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1187-1192, November-December 1975. 3 fig, 6 tab, 16 ref.

Descriptors: *Irrigation, *Irrigation effects, *Nitrogen, *Nutrients, Fertilizers, Fertilization, *Crop production, Soil water, Moisture stress.
Identifiers: *Continuous function designs.

Continuous variable (CVD) and randomized block, split plot (RBSD) designs were used to produce data from which production functions were developed relating corn yield to soil water and nitrogen fertilizer. Data were collected at Logan, Utah in 1972 and Farmington, Utah in 1973. The CVD water and nitrogen treatments, respectively, were sequential or continuous and not randomized. The design is compact but has some statistical uncertainty. The CVD had 7 or 8 soil water (W) levels and 22 or 24 nitrogen (N) levels compared to 4 W and 5 N levels for RBSD. The area used for the RBSD was 3 or 4x that used for the CVD. The data analyzed for the CVD led to the same conclusions as the analysis of the RBSD. The production function (regression equation) at Logan was different from that at Farmington except when comparisons were made on a relative basis. (Skogerboe-Colo St)

EFFECT OF LIME ON BORON TRANSPORT TO AND UPTAKE BY COTTON,
Arkansas Univ., Fayetteville. Dept. of Agronomy.
H. D. Scott, S. D. Beasley, and L. F. Thompson.
Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1116-1121, November-December 1975. 3 fig, 5 tab, 22 ref.

Descriptors: *Boron, *Cotton, *Crop response, Soils, Soil investigations, Soil chemistry, Moisture stress, Adsorption, Diffusivity, *Lime, *Absorption, Path of pollutants.

Deficiencies of Boron have occurred in cotton grown in coarse textured soils during periods of moisture stress and in those soils which have been recently limed. These B deficiencies have generally been attributed to a decrease in soil B availability to cotton. As a result a greenhouse experiment was conducted to study (1) the amounts of adsorption and diffusivity rates of B in two silt loams and (2) B adsorption by cotton grown in pots. Addition of lime increased B adsorption by both a Taloka silt loam and a Calloway silt loam. Maximum B adsorption occurred on the seventh day after its addition but did not differ appreciably from the one day equilibration time. The adsorption data could not be accurately described by the Langmuir adsorption equation. (Skogerboe-Colo St)

IRRIGATING SOYBEANS WITH LIMITED WATER,
Kansas Agricultural Experiment Station, Manhattan. Evapotranspiration Lab.
L. R. Stone, W. L. Powers, and C. D. Nickell.
Kansas Water Resources Research Institute Contribution Number 158. Kansas Agricultural Experiment Station Bulletin, Keeping Up With Research 18, March 1975. 3 p, 1 fig, 4 tab. OWRT A-069-KAN(2). 14-31-0001-5016.

Descriptors: Growth stage, *Soybeans, *Irrigation practices, *Soil moisture, Crop production, Soil water.
Identifiers: *Soybean lodging, *Limited irrigation, Soil-moisture depletion.

During the past three years soybean yields and lodging as influenced by irrigation amount and time were evaluated. The results should help irrigators who want to use less water because of limited water supply, limited pumping capacity, limited time, increased cost of fuel for pumping, or other reasons. The 3 years of data indicate that full-season irrigation does not increase soybean yields, but increases lodging over soybeans irrigated only during pod formation and filling (bean development). Limited in-season irrigation is most practical in soils with large water-holding capacity and nothing to restrict extensive root development; and if a moderate to large amount of soil water is stored before planting.

DRIP IRRIGATION INCREASES YIELD AND SIZE OF 'SUNRICH' NECTARINES,
Florida Univ., Gainesville. Dept. of Fruit Crops.
J. F. Bartholic, and D. W. Buchanan.
Proceedings of the Florida State Horticultural Society, Vol 88, p 509-511, 1975. 1 fig, 1 tab, 10 ref. OWRT B-014-FLA(7). 14-31-0001-3868.

Descriptors: Evapotranspiration, Evapotranspiration control, Energy budget, Oranges, Water balance, Crop production, Orchards, Fruit crops.
Identifiers: Drip irrigation.

A 'Sunrich' nectarine orchard was established in 1972 with drip irrigation on 2/3 of the orchard with 1 emitter per tree and permanent overhead irrigation on the remaining 1/3. Drip irrigation required about 1/3 less water during the first 3 years of the experiment. Tree growth during this period was similar; however, root studies show there was a difference in rooting patterns between drip and overhead irrigation. Roots were concentrated between 6 and 24 inches in the soil under drip irrigation and in the top ft. where overhead irrigation supplemented rainfall. Even with only 3 gal per day applied to trees during the 1975 fruiting season, there were significant increases in yield and fruit size with drip irrigation. (Morgan-Florida)

Descriptors: *Irrigation, *Crops, *Yield equations, *Simulation analysis, *Stochastic processes, *Regulation, *Groundwater, Economics, Water allocation(Policy), Soil water, Soil moisture, Pumping, Decision making, Farm, Income, Water policy, Evaluation, Systems analysis, Great Plains.
Identifiers: *Ogallala Formation(Great Plains), *Bioeconomic model, Dryland crops, Marginal private costs, Marginal social costs.

Developed is a firm-level bioeconomic simulation model capable of stochastically determining yields for the major dryland and irrigated crops in the central basin of the Ogallala Formation as a function of soil moisture and atmospheric stress during critical stages of plant development. The Ogallala Formation is a major unconsolidated aquifer providing irrigation water for much of the Great Plains. The model presented is used to evaluate three methods of regulating groundwater irrigation: no restriction; a quantity limitation; and a graduated tax per unit above the quantity limitation. Results differ for poor and adequate water situations but indicate the potential value of an educational program on timing of irrigation application to maximize net farm income. (Bell-Cornell)

WHAT'S IN THE FUTURE FOR SPRINKLER IRRIGATION,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
W. E. Splinter.
Irrigation Age, Vol. 9, No. 6, p 26, p 30, March 1975.

Descriptors: Irrigation, *Sprinkler irrigation, *Irrigation practices, Irrigation systems.

Man's recognition of the need for water for plants appears nearly as old as agriculture. Ancient works in Asia Minor indicate that quite complex irrigation systems were developed several thousand years ago. Many of the ancient systems are still in use. The use of external energy to move water appeared first with the use of wind powered pumping plants. Since its inception irrigation has required high inputs of effort and management. MANAGING THE SOUTHWESTERN NATIONAL FORESTS FOR WATER AND RELATED RESOURCES,
Forest Service (USDA), Washington, D. C.
J. R. McGuire.
19th Annual Arizona Watershed Symposium Proceedings, Report No. 7, p 35-36, September 1975.

Descriptors: *National forest, *Southwest U.S., *Forest management, *Watershed management, *Water yield improvement, *Water quality standards, *Herbicides, Natural resources.

National forest management in the Southwest is discussed with regard to legal guidelines, policy-making and research on water and related resources of forest land. Two basic principles of National Forest Management issued in the 1950's are still applicable: protection of the watershed by stabilizing the soil and thereby preserving and enhancing water quality; and management of the area to improve water yields. Multiple use management accounts for timber production, recreation, grazing and wildlife as priorities equal to water yield. Watershed management studies and their benefits are briefly discussed; in Arizona alone, $10 million in public and private funds has been spent on such projects. Problems described include the meeting of water quality standards, the cost of increasing water yields, and the impact of chemical herbicide restrictions on water yield improvement programs. Future watershed management studies and programs are discussed. (See also W77-02104) (Jahns-Arizona)

OPERATION OF A RESERVOIR COLLECTING WATER FROM A SMALL WATERSHED,
Technion - Israel Inst. of Tech., Haifa. Lowdermilk Faculty of Agricultural Engineering.
N. Buras, M. H. Diskin, and S. Zamir.
Water Resources Research, Vol. 12, No. 5, p 866-872, October 1976. 5 fig, 6 tab, 3 ref.

Descriptors: *Reservoir operation, *Optimization, *Economic efficiency, Watersheds(Basins), Operations research, Synthetic hydrology, Storm runoff, Decision making, Irrigation, Reservoir storage, Pumping, Costs, Benefits, Equations, *Small watersheds.
Identifiers: *Operating policy, *Linear control curves, Operating targets, *Cost minimization, Dalton Reservoir(Israel), Economic criteria.

Best operation policies, linear and nonlinear, were developed for a small reservoir in which storm runoff water might be augmented by pumping water from another source. These policies were aimed at a full reservoie at the beginning of the yearly irrigation season and, indirectly, utilized more efficiently the existing neighboring pumping installations, which are usually idle in winter. The operating policies are expressed as time-dependent functions indicating the level of the reservoir which would ensure its being full at the end of the rainy season with a given probability. When these policies were tested with a synthetic hydrologic series of 45 years, it appeared that the cost of operating the reservoir was inversely proportional to the daily amount of water pumped into it from external sources. Identifiers: *LANDSAT, *St John River(Maine).

On 19-25 September, two snow pillows were interfaced to DCP's in the Saint John River basin area of northern Maine to obtain real time information on the water equivalent of the snowpack. NED's direct LANDSAT DCS ground receive facility or Local User Terminal (LUT) was completely installed as of 15 September. A period of initial testing ensued, and the system was fully operational by mid-December. For the first three weeks, antenna pointing angles were transferred to the tracking equipment via paper tape, but within a short time, this was circumvented by a direct interface to out NOVA mini-computer. At the end of the reporting period, the system was operable in an automatic mode and could be left unattended overnight and during weekends. (Sims-ISWS)

APPLICATIONS OF ERTS PRODUCTS IN RANGE AND WATER MANAGEMENT PROBLEMS, SAHELIAN ZONE: MALI, UPPER VOLTA AND NIGER,
Geological Survey, Denver, Colo.
M. E. Cooley, and R. M. Turner.
Open-file report (West Africa Investigations), 1975. 68 p, 17 fig, 3 tab, 12 ref.

Descriptors: *Satellites(Artificial), *Remote sensing, *Range management, *Water management(Applied), *Africa, Environmental control, Environmental effects, Public Health, Mapping.
Identifiers: Satellite imagery, *ERTS(LANDSAT), *Sahel, *Mali, *Upper Volta, *Niger.

A field investigation was conducted during April and May of 1974 to evaluate the application of Earth Resources Technology Satellites (ERTS, now called LANDSATS) imagery to range and water management problems in the Sahelian zone. ERTS imagery was studied, then evaluated by inspecting ground features in trips by car, light plane and commercial jet airlines. The study indicates such imagery can provide general overviews of regions or entire countries and is viable in areas where ground surveys are inadequate or nonexistent. They also allow repetitive inventorying and monitoring of transient environmental changes on the earth's surface, and aid in solving special problems of disease control and resource development. Applications include riverblindness and tsetse fly control, bush-burning evaluation, distinction of arable from nonarable land, and the analysis of accelerated erosion problems. Mapping and imagery selection are discussed, and the limitations imposed by environmental conditions are described. (Jahns-Arizona)

SIMULATED EFFECTS OF THE PROPOSED TENNESSEE COLONY RESERVOIR ON GROUND-WATER CONDITIONS IN THE CARRIZO-WILCOX AQUIFER AND TRINITY RIVER ALLUVIUM, TEXAS,
Geological Survey, Austin, Tex. Water Resources Div.
S. Garza.
Reprint from International Symposium on the Hydrological Characteristics of River Basins and the Effects on these Characteristics of Better Water Management, held in Tokyo, Japan, December 1975: International Association of Hydrological Sciences Publication No. 117, p 597-605, 1975. 4 fig, 9 ref.

Descriptors: *Baseline studies, *Pre-impoundment, *Computer models, *Steady flow, Effects, Aquifers, Downstream, Reservoirs, Forecasting, Groundwater, Aquifer characteristics, *Texas.
Identifiers: *Trinity River flood plain(Tex), *Carrizo-Wilcox aquifer(Tex).

Digital-computer models were used to simulate the steady-state effects of the proposed Tennessee Colony Dam and Reservoir on ground-water conditions in the Carrizo-Wilcox aquifer and in the Trinity River alluvium downstream from the reservoir. The proposed structure, located south of Dallas on the Trinity River flood plain, is part of a multipurpose development by the U.S. Army Corps of Engineers on the Trinity River and tributaries between the Dallas-Fort Worth area and the Texas Gulf Coast. Preliminary analyses indicate that the potentiometric surface in the Carrizo-Wilcox aquifer in the outcrop area would be near land surface only in low-lying areas near the reservoir shoreline, where rises of 30 feet to more than 40 feet would occur in some areas. Lesser rises would occur in the area where the aquifer is artesian, but they would spread out over greater distances; rises of 5 feet would occur at distances of 20 miles from the dam. Rises in aquifer head in the Trinity River alluvium would extend to not more than 5 miles downstream from the proposed dam. Without remedial action, the altitude of the potentiometric surface would be above or near land surface in most of the area within about 2 miles downstream from the dam. (Woodard-USGS)

EFFECTS OF WATER MANAGEMENT ON FRESH-WATER DISCHARGE TO BISCAYNE BAY,
Geological Survey, Tallahassee, Fla. Water Resources Div.
T. J. Buchanan, and H. Klein.
Paper presented at Biscayne Bay Symposium I, held in Florida, April 2-3, 1976, University of Miami Sea Grant Special Report No 5, p 271-277, 1976. 4 fig, 7 ref.

Descriptors: *Watershed management, *Flood control, *Flow control, *Water quality, *Surface-groundwater relationships, Florida, Canals, Saline water intrusion, Bays, Water level fluctuations, *Florida.
Identifiers: *Biscayne Bay(Fla).

Prior to development in southeast Florida, fresh water discharged to Biscayne Bay consisted of flow through natural drainageways, overland flow and coastal underseepage from the Biscayne aquifer. Present day discharge to the bay is seasonal, from controlled canals and seepage. The fresh-water flow to Biscayne Bay has been significantly reduced in quantity and in time due to extensive flood and water control measures instituted as a result of the extensive flooding in 1947. As a result of these flood and water control measures, surface flows could be fully controlled in the Everglades by the end of 1962. Because of the controls fresh-water levels in south Dade now recede twice as fast as before. Thus, since 1953 annual fresh-water flow to the bay has been reduced by about 20 percent and the time period for storm runoff has also been reduced. (Woodard-USGS)

Identifiers: *Suwannee River basin(Fla), Data base applications.

The report summarizes the availability of hydrologic data, portrays future data needs and the networks and programs that will have to be implemented to obtain data not already available for the Suwannee River basin in Florida. The existing data base consists of extensive geologic and topographic mapping and water resource investigations in 7 of the 15 counties of the District. It also consists of large blocks of water-use data, streamflow and ground-water-level records and lake- and reservoir-stage records. Water-quality records are available for 17 sites. The location of all data-collection points is shown. Data collection techniques are included. (Woodard-USGS)

ECONOMIC AND ENVIRONMENTAL IMPACTS OF AGRICULTURAL LAND DRAINAGE IN ONTARIO,
York Univ., Downsview (Ontario). Dept. of Geography.
W. C. Found, A. R. Hill, and E. S. Spence.
Journal of Soil and Water Conservation, Vol. 31, No. 1, p. 20-24, 1976. 2 fig, 1 tab, 10 ref.

Descriptors: *Environmental effects, *Economic impact, *Drainage systems, *Canada, Ditches, Drainage programs, Agriculture, Agricultural engineering, Drainage effects, Cost-benefit ratio, Cost-benefit analysis, Economic justification.
Identifiers: *Ontario(Canada).

Economic and environmental impacts of government-assisted agricultural land drainage in seven Ontario townships, which are representative of the full range of drainage conditions in the province, were investigated. Thirty-seven drainage projects completed between 1965 and 1970 were included. Emphasis was on the local impacts as experienced at the level of the individual farm and municipal outlet drains, and benefit-cost ratios were derived for each project. It is concluded that on the whole, the drainage projects have generated benefits for agriculture at the local level without creating

U. OF I. URBANA-CHAMPAIGN

undue environmental damage. However, a number of drainage projects had a very low benefit-cost ratio, and much variation existed even within a given township. This variation was accounted for by the identification of seven variables: (1) agricultural productivity of the environment, (2) installation of field tile drainage, (3) special hydrological conditions, (4) local initiative with respect to use of the drains, (5) type of drainage project, (6) quality of the drain engineering, and, (7) weather conditions since completion of the projects. The only serious environmental losses reported pretained to loss of permanent wetlands and the channelization of streams. However, the cumulative effect of a number of drainage projects, each of which has only minor effects on the environment, may have serious hydrological consequences. (Luedtke-Wisconsin)

SKYLAB IMAGERY: APPLICATION TO RESERVOIR MANAGEMENT IN NEW ENGLAND,
Cold Regions Research and Engineering Lab., Hanover, N.H. Research Div.
H. L. McKim, L. W. Gatto, C. J. Merry, and R. K. Haugen.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-17464, Price codes: A04 in paper copy, A01 in microfiche. Report NASA-CR-144514, September 1975. 59 p, 11 fig, 12 tab, 20 ref, 2 append. NASA T-4646B.

Descriptors: *Remote sensing, *Reservoir operation, *Land use, *Runoff, *New England, Satellites(Artificial), Aerial photography, Surveys, Photography, Reservoirs, Estuaries, Rivers, Classification, Land classification, Watersheds(Basins), Water resources, Water resources development.
Identifiers: *Skylab, *LANDSAT, Imagery.

The purpose of this investigation was to determine the utility of Skylab S190A and B photography for providing reservoir management information in New England. LANDSAT, Skylab S190A and S190B and RB-57/RC8 images were reduced to a common scale of 1:63,360 for a mapping base to demonstrate the extent to which the imagery could be utilized in the preparation of reconnaissance land use maps. These types of maps are required in the baseline evaluation of areas for reservoir management planning and for future environmental planning activities, i.e., permit evaluation and impact statements. Visual interpretations were accomplished on original NASA color infrared S190A/B and RB-57/RC8 transparencies and a LANDSAT false color print. The relative utility of the multiband imagery in identifying and quantifying hydrologic factors was evaluated. The land use statistics for two small watersheds were determined, and the effects of these land use factors were appraised for possible contribution to runoff potential. Significant findings of this investigation were as follows: (1) S190B imagery is superior to the LANDSAT MSS imagery for land use mapping and is as useful for category I and II land use mapping as the high altitude RC8 imagery; (2) for evaluating volume runoff potentials, the S190B imagery was found to be as useful as the RB-57/RC8 imagery; and (3) where regional hydrologic surveys and land use mapping are critical requirements in urban planning and natural resource development, the S190B imagery is of great potential value. Identifiers: *Two-regime flow, Galerkin method,

A mathematical method and a Galerkin finite el ment formulation were presented for steady tw regime flow toward wells in confined and unco fined aquifers. The model was verified by compa ing the finite element solutions of typical cas with pumping test results obtained from laborato experiments. A new type curve method for dete mining the in-situ hydraulic characteristics of selected aquifer material was described. It w shown that the method leads to good agreeme between the theory and experiments and that t in-situ values may be quite different from the co responding values obtained from permeabili tests on a sample of the aquifer. EFFECTS OF WATER-MANAGEMENT PRACTICES ON THE FLOW OF THE SOUTH PLATTE RIVER, COLORADO,
Geological Survey, Lakewood, Colo. Water Resources Div.
R. T. Hurr.

Reprint from International Symposium on the Hydrological Characteristics of River Basins and the Effects on these Characteristics of Better Water Management, held in Tokyo, Japan, December 1975: International Association of Hydrological Sciences Publication No. 117, p 611-618, 1976. 7 fig, 1 ref.

Descriptors: *Water management(Applied), *Surface-groundwater relationships, *Colorado, *Irrigation, Water yield, Water utilization, Water demand, Diversion, Streamflow, Water wells, Groundwater recharge, River basins, Flow control, Model studies.
Identifiers: *South Platte River(Colo).

Water-management practices have affected the various components which make up the flow of the South Platte River in Colorado. Installation of wells and ground-water withdrawals that for many years were individual and unregulated farm-management practices, have reduced the return flow to the river. However, an increase in trans-mountain diversions that resulted in an increased return flow of irrigation water to streams tributary to the South Platte River, occurred simultaneously with a decrease in direct diversions from the river. The effect was little net change in annual streamflow of the South Platte River at the Colorado-Nebraska State line. Design of effective and efficient water-management practices is directly influenced by the interrelations between ground water and surface water, and the effects of imported water on the system. Currently a study of the South Platte River includes the calibration of a computer model of the study area based on observed hydraulic characteristics and interrelations. When calibrated the model can be used to determine future effects of alternative management plans. (Woodard-USGS)

POTENTIAL FOR DEVELOPMENT OF GROUND WATER AT A TEST SITE NEAR TRURO, MASSACHUSETTS,
Geological Survey, Boston, Mass. Water Resources Div.
J. H. Guswa, and C. J. Londquist.
Open-file report 76-614, 1976. 22 p, 9 fig, 2 tab, 11 ref.

Descriptors: *Groundwater resources, *Groundwater availability, *Aquifer testing, *Saline water-freshwater interfaces, Sea water, *Massachusetts, Coasts, Water supply, Projection, Water resources development.
Identifiers: *Truro(Mass).

An aquifer test was carried out at a possible ground-water development site in Truro, Massachusetts. Average lateral hydraulic conductivity for material in the screened interval of the test well is 216 feet per day. Specific yield of the material at water-table depth is about 0.10. Anisotropy, or ratio of lateral hydraulic conductivity to vertical hydraulic conductivity, is between 1 and 5 for the uppermost 60 feet of saturated material, but is probably much higher at greater depths. Calculation of drawdown after pumping 200 days at 1 million gallons per day indicates lateral intrusion of saline water from the sea would not reach the well and that the area of ground-water contribution would be sufficient to intercept an amount of average annual recharge equal to pumpage. Using the previously determined aquifer constants and the maximum drawdown after 200 days of pumping at 1 million gallons per day, it was determined that a stable upconing adjustment of the fresh water/saline-water interface would occur below the pumping well, and saline water would not reach the well through vertical intrusion. (Woodard-USGS)
W77-02306

RECONNAISSANCE OF GROUND-WATER RESOURCES OF THE SQUAXIN ISLAND INDIAN RESERVATION, WASHINGTON,
Geological Survey, Tacoma, Wash. Water Resources Div.
W. E. Lum, II, and K. L. Walters.
Open-file report 76-382, 1976. 49 p, 10 fig, 3 tab, 11 ref.

Descriptors: *Groundwater resources, *Hydrogeology, *Aquifer characteristics, *Water quality, *Available water, Pumping, Water yield, Water pollution sources, Septic tanks, Biological properties, Saline water intrusion, Chemical analysis, Water supply, *Indian reservations, *Washington.
Identifiers: *Squaxin Island Indian Reservation(Wash).

A supply of fresh ground water for the Squaxin Island Indian Reservation, Washington, exists in saturated deposits underlying the 3.09-square-mile island. Four test wells tapped a water-bearing zone of sand and gravel and had yields ranging from 27 to 170 gpm, with drawdowns of about 5 feet to about 65 feet. Except for high concentrations of iron and manganese (which can be treated and reduced for domestic use), the water quality is good. Conditions for drain-field waste disposal from septic tanks are good in at least the northern two-thirds of the island. The danger of inducing seawater encroachment can be minimized by maintaining pumping levels above sea level, using a network of several wells pumped intermittently into a storage facility, and spacing these wells to spread out the effects of pumping. In the northern half of the island, wells 100 to 200 feet deep may yield 25 to 100 gpm with minimum chances of seawater encroachment. The southern half of the island has a smaller apparent potential for groundwater development and an increased possibility of seawater encroachment. (Woodard-USGS)

HYDROLOGY OF LAKE COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla. Water Resources Div.
D. D. Knochenmus, and G. H. Hughes.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 775, Price codes: A06 in paper copy, A01 in microfiche. Water-Resources Investigations 76-72, August 1976. 100 p, 35 fig, 15 tab, 55 ref.

Descriptors: *Hydrologic budget, *Surface waters, *Groundwater, *Water supply, *Water quality, Water demand, Aquifer characteristics, Groundwater movement, Water yield, Pumping, Groundwater recharge, Streamflow, Lakes, Hydrologic data, Water wells, Chemical analysis, Saline water-freshwater interfaces, *Florida.
Identifiers: *Lake County(Fla).

Lake County includes a 1,150 square-mile area consisting of ridges, uplands, and valleys in central-peninsular Florida. About 32 percent of the county is covered by lakes, swamps, and marshes. Water requirements in 1970 averaged about 54 million gallons per day. About 85 percent of the water was obtained from wells; about 15 percent from lakes. The Floridan aquifer supplies almost all the ground water used in Lake County. Annual recharge to the Floridan aquifer averages about 7 inches over the county; runoff average 8.5 inches. The quality of ground and surface water in Lake County is in general good enough for most uses; however, the poor quality of Floridan-aquifer water in the St. John River Valley probably results from the upward movement of saline water along a fault zone. Surface water in Lake County is usually less mineralized than ground water but is more turbid and colored. (Woodard-USGS)

GROUND-WATER RESOURCES AND GEOLOGY OF ST. CROIX COUNTY, WISCONSIN,
Geological Survey, Madison, Wis. Water Resources Div.
R. G. Borman.
Wisconsin Geological and Natural History Survey, Madison, Information Circular No 32, July 1976. 30 p, 15 fig, 1 plate, 2 tab, 17 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water supply, *Water quality, *Hydrogeology, Water wells, Pumping, Water yield, Water users, Water demand, Available water, Chemical analysis, Hydrologic data, *Wisconsin.
Identifiers: *St. Croix County(Wis).

The increasing need for good-quality ground water in St. Croix, County, Wisconsin, caused by a steadily increasing population, can be met from the sand-and-gravel and sandstone aquifer. As much as 15 gpm can be obtained from wells almost everywhere in the county. Yields of more than 1,000 gpm are available from glacial deposits and alluvium where there is sufficient thickness of saturated sand and gravel. The sandstone aquifer underlies the entire county and is more than 1,000 feet thick in the southwest near River Falls. In St. Croix County the sandstone aquifer is all bedrock younger than Precambrian age and includes, in ascending order, from oldest to youngest, sandstones of Cambrian age (in ascending order, the Mount Simon, Eau Claire, Galesville, and Franconia Sandstones, and the Trempealeau Formation); and the Prairie du Chien Group, St. Peter Sandstone, and Galena-Platteville unit (Platteville and Decorah Formations and Galena Dolomite, undifferentiated), all of Ordovician age. This aquifer is capable of yielding more than 1,000 gpm to wells in much of the county and is the principal source of municipal water. The water from both aquifers is hard to very hard, having a median hardness between 180 and 190 mg/liter. Iron and manganese are locally present with combined total exceeding 0.3 mg/liter. Nitrate is a minor problem in both aquifers with median concentrations more than 10 mg/liter. About 3.83 mgd of ground water was pumped in the county in 1974, of which 94 percent was from the sandstone aquifer. About 44 percent of the total water pumped was for industrial and commercial use, 42 percent for residential use, and 14 percent for irrigation, institutional, and municipal use. (Woodard-USGS)

GROUND-WATER HYDROLOGY OF THE COCOA WELL-FIELD AREA, ORANGE COUNTY, FLORIDA,
Geological Survey, Tallahassee, Fla Water Resources Div.
C. H. Tibbals, and J. M. Frazee, Jr.
Open-file report FL 75-676, January 1976. 67 p, 25 fig, 6 tab, 10 ref.

Descriptors: *Groundwater, *Hydrogeology, *Water wells, *Well data, *Water quality, Water supply, Data collections, Aquifer characteristics, Water levels, Pumping, Saline water-freshwater interfaces, Groundwater recharge, Chemical analysis.
Identifiers: *Orange County(Fla), Cocoa well-field area.

The city of Cocoa, Brevard County, Florida, supplies water for much of central Brevard County including Cape Kennedy and Patrick Air Force Base. The water supply is obtained from a well field in east Orange County. Many of the easternmost wells in that well field yield salty water (chloride concentration greater than 250 milligrams per liter). The interface between the fresh and salty water in the west part of the well field occurs at a depth of about 1,400 feet. An upward hydraulic gradient exists between the the lower (salty) zones and the upper, or pumped zones of the Floridan aquifer in the west part of the well field. Secondary artesian aquifers in the well-field area are relatively high-yielding but are of limited areal extent. However, they are suitable as a source of water for supplemental supply or for artificially recharging the Floridan aquifer. Fresh water was transferred by siphon from a secondary artesian aquifer to the Floridan aquifer at 90 gallons per minute. Artificial recharge and recovery experiments show that it is feasible to retrieve fresh water stored in salty zones of the Floridan aquifer. (Woodard-USGS)

GROUNDWATER AND GROUNDWATER LAW IN MASSACHUSETTS.
Massachusetts Commonwealth Div. of Water Resources, Boston.
Publication No. 8852-95-250, April 1976. 97 p. 21 fig., 9 tab., 57 ref.

Descriptors: *Groundwater resources, *Water pollution, *Water law, *Massachusetts, Groundwater availability, Streamflow, Groundwater recharge, Inter-basin transfers, Surface-groundwater relationships, Water levels, Water table, Water quality, Saline water intrusion, Waste disposal, Coliforms, Septic tanks, Eutrophication, Waste water disposal, Leachates, Deicers, Landfills, Land use, Metals, Common law, Well permits, Regulation, Water rights, Pesticides, Phenols, Judicial decisions, Water allocation(Policy), Sodium chloride.
Identifiers: *Groundwater law, Case studies.

The interrelationship of groundwater and surface water, together with the effects of man's activities on water quality, in Massachusetts, are described followed by case studies on water quantity and quality problems experienced in specific communities. Water quantity examples include: intercommunity competition for water resources, low streamflow related to groundwater withdrawal, need to protect recharge areas, and effect of out-of-basin transfers. Water quality cases include contamination by sodium chloride, by effluent from septic tanks, by leachate from solid waste disposal sites, and by other pollutants such as iron, lead, and pesticides. Current groundwater law in Massachusetts and the economic aspects of groundwater management are also discussed. It is concluded that: (1) consumptive use of groundwater may significantly degrade uses and rights in related surface water systems, (2) unregulated consumption use by private users could threaten to aggravate problems of safe yield, (3) existing common law groundwater rights in Massachusetts can be improved in light of modern knowledge and technology, (4) groundwater pollution is a recurring problem with regional as well as local impacts, resulting from road salt usage, concentrations of septic systems, and municipal and industrial waste disposal practices, and (5) land use practices can significantly impair recharge areas. TRANSPORT OF MASS AND ENERGY IN POROUS MEDIA DUE TO NATURAL CONVECTION--THE GEOTHERMAL BASIN PROBLEM,
Colorado Univ., Boulder. Dept. of Mechanical Engineering.
D. R. Kassoy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-247 087, Price codes: A02 in paper copy, A01 in microfiche. Report NSF-RA-N-75-118, March 26, 1975. 21 p, 1 fig, 20 ref. NSF AER74-03429.

Descriptors: *Geothermal studies, *Mass transfer, *Heat transfer, *Porous media, Energy, *Energy transfer, Thermal water, Aquifers, Groundwater, Geology, Model studies, Mathematical models, On-site investigations, Heat flow, Convection, Temperature, Geophysics
Identifiers: *Geothermal fields, Nonisothermal fluids.

The initial 7-month study of physical phenomena occurring in geothermal basins was described. Geological and geophysical field data have been

utilized to develop plausible models of the energy-mass transport systems in geothermal anomalies. The basic describing equations for saturated thermally-active elastic porous media were discussed in the context of modeling physical processes occurring in the geothermal environment. From studies to date the following conclusions have been reached: (1) Deformations in the solid matrix resulting from the application of large liquid pressure gradients may be significant; (2) Two-temperature models will not be necessary for the convective modeling effort due to the very slow flow rates (1 cm/day) involved; (3) Vertical natural convection processes play a significant role in the transport of hot water and energy in undeveloped geothermal regions. Measured output prior to production is very closely estimated by vertical convection study predictions; (4) Locally permeable vertical fault zones may be the significant conduits for heated fluids from depth. Reservoir charging may result when the faulted region intersects relatively permeable horizontal formations; and (5) One of the most critical aspects of making computations and theoretical calculations is to establish models whose geological and mechanical characteristics relate closely to those found in nature. MARYLAND HIGHWAY DRAINAGE STUDY: VOLUME II - A COMPARISON OF MARYLAND HIGHWAY DRAINAGE PRACTICES WITH THOSE OF OTHER AGENCIES,
Maryland Univ., College Park. Dept. of Civil Engineering.
R. M. Ragan, and Y. M. Sternberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 556, Price codes: A06 in paper copy, A01 in microfiche. Report AWO74-073-046-2, July 1974. 100 p, 38 fig, 1 tab, 1 append. AWO74-073-046.

Descriptors: *Drainage practices, *Highways, *Maryland, *Runoff, *Drainage, Drainage systems, Subsurface drainage, Surface runoff, Surface waters, Design storm, Storm drains, Urban drainage, Drainage water, Hydrographs, Drainage engineering, Hydrology, Hydraulics, Civil engineering.
Identifiers: *Highway drainage.

One of the key objectives of the Highway Drainage Study was a review of Maryland State Highway Administration drainage practice and a comparison with the approaches followed by other states. In developing this comparison of Maryland State Highway Administration drainage practices with those of other agencies, the Highway Departments of the States of Massachusetts, Connecticut, New York, New Jersey, Delaware, Pennsylvania, Ohio, Virginia, West Virginia, North Carolina, South Carolina, Tennessee, Kentucky, and California were contacted. The report included discussions of some of the key information contained in the drainage manuals of these other states and comparisons with the material included in Interim Hydraulic Criteria for the Design of Highways used by Maryland. Emphasis was placed on the methods used to determine peak discharges because this area shows the greatest variability among the states. (See also W77-02490) (Sims-ISWS)
W77-02491

MARYLAND HIGHWAY DRAINAGE STUDY: VOLUME III - A LINKED SYSTEM MODEL FOR THE SYNTHESIS OF HYDROGRAPHS IN URBAN AREAS,
Maryland Univ., College Park. Dept. of Civil Engineering.
M. J. Root, and R. M. Ragan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 557, Price Codes: A05 in paper copy, A01 in microfiche. Report AW074-073-046-3, July 1974. 84 p, 15 fig, 22 ref, 5 append. DOT AW074-073-046.

Descriptors: *Urban hydrology, *Model studies, *Drainage, Urban drainage, Mathematical models, Computer models, Algorithms, Hydrographs, Rainfall, Runoff, Urban runoff, Computer programs, Drainage practices, Drainage engineering, Design storm, Hydrology, Civil engineering.

The algorithm developed in this report made use of the equations for one-dimensional, unsteady, spatially varied open channel flow and an empirical overland flow mathematical model. The technician or engineer does not need a knowledge of the equations used since he is required only to describe the physical features of the drainage area and to select the hyetograph. The computer automatically develops the hydrograph and returns the value of the discharge at pre-selected time intervals. (See also W77-02490) (Sims-ISWS)
W77-02492

MARYLAND HIGHWAY DRAINAGE STUDY: VOLUME VI - AN EXPERIMENTAL EXAMINATION OF THE SUBSURFACE DRAINAGE OF ROADWAYS,
Maryland Univ., College Park. Dept. of Civil Engineering.
R. S. Taylor, and R. M. Ragan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 558, Price Codes: A05 in paper copy, A01 in microfiche. Report AW074-073-046-6, July 1974. 94 p, 28 fig, 28 tab, 23 ref, 5 append. DOT AW074-073-046.

Descriptors: *Subsurface drainage, *Model studies, *Highways, *Drainage, Drainage systems, Infiltration, Roads, Reviews, Drainage engineering, Groundwater, Storm drains, Drainage waters, Hydrographs, Hydrology, Drainage engineering, Civil engineering.
Identifiers: *Highway drainage, Analog models, Hele-Shaw model.

The report described a series of experiments conducted with an electric analog and Hele-Shaw Model to investigate the steady and unsteady flows in highway base courses. The Hele-Shaw Model was used to study the effects of the general groundwater table and local geometry of the system on the unsteady discharge into a typical ditch section. The geometry used was a fixed trench section without a pipe that modeled the field condition of a drainage ditch backfilled with coarse gravel. Before the experiments were started, a dimensional analysis was performed to isolate the important parameters influencing the discharge. The dimensional analysis was used to control the groundwater elevations set in the ditch and at the upper boundary and the distance from the trench bottom to the impervious layer. A hydrograph was obtained for each set of geometric conditions. The analog model was used to study the pipe-trench, sub-base system with a spatially varied infiltration entering the sub-base through the pavement and shoulder. The diameter of the drain was allowed to vary from four to twelve inches (300%) while the depth of the embedment varied. (See also W77-02490) (Sims-ISWS)

4D. Watershed Protection

THE ARIZONA WATER PLAN: A STATUS REPORT,
Arizona Water Commission, Phoenix.
T. C. Clark.
In: 19th Annual Arizona Watershed Symposium Proceedings, Report No. 7, p 9-23, Sept. 1975. 2 fig, 7 tab.

Descriptors: *Planning, *Water resources development, *Arizona, *Water supply, *Water utilization, Consumptive use, Groundwater, Groundwater availability, Groundwater recharge, Surface waters, Basins, *Water requirements, *Water demand, *Watershed management, Water yield improvement.

Information is presented from the Arizona Water Commission's report, Inventory of Resources and Uses, which represents Phase I of the Arizona Water Plan. This report compares water supply and use and discusses Arizona's current water problems. Phases II and III will provide technical evaluation of the various forms the water plan might take. The state's total annual surface water diversion from 1968 to 1972 was 3.3 million acre-feet, with Yuma and Maricopa counties accounting for 57 and 29% of the total, respectively. Water resources development is concentrated in 24 basins which contain 89% of the state's population, produce some 60% of the mineral industry revenues and 96% of the crops, and account for 94% of the total water depletion. Substantial groundwater remains in storage, but the annual rate of recharge is limited. Of the water supply, 60% is withdrawn from the ground and 40% from surface supplies. The estimated total dependable supply is 2.8 million acre-feet, of which only 11% is comprised of annual recharge or dependable groundwater supply. Agriculture consumes 89% of the water used. Problems such as the imbalance between supply and consumption are discussed. (See W77-02105 thru W77-02111) (Jahns-Arizona)

CONTROLLING EROSION AND SEDIMENTATION AT CONSTRUCTION SITES,
G. Dallaire.
Civil Engineering, American Society of Civil Engineers, p 73-77, October 1976. 5 fig, 12 photo.

Descriptors: *Erosion control, *North Carolina, *Erosion, *Sedimentation, *Control, Control systems, Runoff, Sediments, Sediment transport, Water pollution control, Water supply, Projects.
Identifiers: *Control equipment, *Construction practices, *Construction sites, Sediment-laden runoff, Stream turbidity.

In recent years the Environmental Protection Agency (EPA) and a number of states have placed emphasis on controlling erosion and sediment-laden runoff from construction sites. Sediment from construction sites causes stream turbidity, impaired water quality, spoiled water supplies, unsightly deposits on adjacent property, and harm to aquatic life. North Carolina has one of the most progressive programs for controlling construction site erosion and sedimentation. This article described some of the methods used in North Carolina and by the EPA. Developers were urged to: (1) divert runoff water originating upstream from the construction site so that water would not flow over bare-earth areas and erode soil; (2) limit the area being graded on a site at any one time to prevent vast stretches of bare soil; (3) limit the time any given area was laid bare; and (4) trap sediment-laden runoff in temporary or permanent basins, or filter the runoff by using silt fences, wood-chip barriers, or brush barriers. INFLUENCE OF TALL WHEATGRASS WIND BARRIERS ON SOIL DRYING,
Agricultural Research Service, Sidney, Mont.
J. K. Aase, and F. H. Siddoway.
Agronomy Journal, Vol. 68, No. 4, p 627-631, July-August 1976. 10 fig, 24 ref.

Descriptors: *Windbreaks, *Wind erosion, *Soil erosion, *Soil water, *Montana, *Wheatgrasses, Evaporation, Soil stabilization, Crop response, Drying.

Studies were conducted to determine the effect of a tall wheatgrass (Agropyron elongatum) wind barrier system on soil drying from fallow soil compared with open-field fallow. A Williams loam soil near Sidney, Montana was used for the experiment. After a 3.8 cm irrigation was applied, soil water content was sampled at half-hour intervals and small depth increments to 10 cm. The top 4 cm of soil inside the barrier system stayed wetter for about 3 days after irrigation when compared with the unprotected area. Drying rates remained constant until about noon of the day after irrigation, at which time the rate was influenced by exposure to wind. Barriers could help during periods of small intermittent precipitation events in April and May by creating a suitable soil water environment for seed germination, plant emergence and establishment, and soil resistance to wind erosion. Barriers control wind erosion except when strong winds blow parallel or nearly parallel to them. If a wind shifts to parallel after intense thunderstorm activity, the wetter surface from barrier protection extends soil resistance to wind erosion. (Jahns-Arizona)

SALT MARSH ESTABLISHMENT AND DEVELOPMENT,
Environmental Concern, Inc., St. Michaels, Md.
E. W. Garbisch, P. B. Woller, and R. J. McCallum.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-014 136, Price codes: A06 in paper copy, A01 in microfiche. Coastal Engineering Research Center TM-52, June 1975. 110 p. 46 fig., 2 tab., 16 ref., 4 append. G31265. DACW72-73-C-0009.

Descriptors: *Vegetation establishment, *Shore protection, *Erosion control, *Coastal marshes, Salt marshes, Invertebrates, Benthos, Chesapeake Bay, Biological communities, Tidal effects, Intertidal areas, Plant growth
Identifiers: *Spartina alterniflora, Dredged material, Spartina patens, Spartina cynosuroides, Distichlis spicata, Ammopila breviligulata.

In order to evaluate coastal shoreline erosion control by vegetation, the establishment of 10 to 15 week-old seedlings of Spartina alterniflora throughout the tidal zone, and of S. patens, S. cynosuroides, Distichlis spicata and Ammophila breviligulata throughout the supra tidal zones of natural and manmade shores exposed to different seasonal wave regimes in the central Chesapeake Bay region was investigated. In areas subject to extensive wave and suspended coarse sediment stresses S. alterniflora transplant mortalities were high, increasing with decreased elevation within the intertidal zone, and with increasing exposure at a given intertidal level within a groin system. Periodic fertilization, and delaying the planting time by one month, reduced mortalities. Mortalities from other causes were negligible. Survival of all species established above these zones was independent of exposure, and development was comparable. Consolidated dredged material substrate stimulated higher S. alterniflora vegetative spread than at either the fertilized or unfertilized unconsolidated sandy substrates. Periodic profile leveling of shoreline areas indicated fluctuations in substrate surface; the surface of the dredged substrate decreased 3 to 7 centimeters. Monitoring of macrobenthic invertebrate colonization revealed that after one year the dredged material site had the highest total population and the natural sites, the lowest. (Luedtke-Wisconsin)

DIFFUSION CELL FOR ISOLATION OF HYDROGEN FLUORIDE FROM THE ANALYZED SAMPLE DETERMINING FLUORINE IN WATER, (IN RUSSIAN),
Main Geophysical Observatory, Leningrad (USSR).
N. Sh. Vol'Berg, and T. A. Kuz'Mina.
Gig Sanit 6, p 51-52, 1975.

Descriptors: *Fluorine, Pollutant identification, Isolation, *Fluorides, Sampling, Analytical techniques, Air pollution.
Identifiers: Analyzed, Cell, Design, Determining, Diffusion, Fluoride, Fluorine, Hydrogen, Isolation, New, Sample, Waste, Water, *Hydrogen fluoride.

A diffusion cell was designed for serial determinations of the content of F- in solid fluorides when analyzing air. To trap HF being liberated from the specimen, a cell cover made of a porous glass plate impregnated with KOH was used. The cell diffusion process consists of displacement of the volatile substance from its compound (for insoluble compounds), diffusion in a liquid layer, diffusion in a gas layer and diffusion in the pores of the sorbent. The cell design and the method of analysis provide high accuracy for measuring F- in solutions and can be used fr waste - and natural water determinations.
W77-02105

DETERMINATION OF SMALL QUANTITIES OF VINYL ACETATE IN AIR, WATER, ALCOHOLIC SOLUTIONS AND FOOD PRODUCTS, (IN RUSSIAN),
Science-Industry Association 'Plastoplimer', Leningrad (USSR).
L. I. Petrova, and Z. K. Boikova.
Gig Sanit 6, p 48-49, 1975.

Descriptors: *Pollutant identification, Foods, Air pollution, *Monitoring, Methodology, Plastics, *Analytical techniques, Sampling, *Colorimetry.
Identifiers: *Vinyl acetate.

In connection with the need to monitor the content of vinyl acetate in various media contacting plastics containing it, a method was developed permitting a sufficiently accurate determination of this substance not only in air but also in water, alcoholic solutions and food products. The method is based on the mericurization of vinyl acetate with the formation of complex compounds and subsequent colorimetric determination of the excess of mercuric acetate on the basis of the reaction with diphenylcarbazide. The sensitivity of the method is 0.001 mg in the analyzed sample.

EVALUATION OF THE RING OVEN TECHNIQUE FOR WATER MONITORING,
Atlantic Research Corp., Alexandria, Va.
R. E. Snyder, M. E. Tonkin, and A. M. McKissick.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-017 062, Price codes: A10 in paper copy, A01 in microfiche. Final Report September 1975. 209 p, 53 fig, 75 tab, 3 append. DADA17-73-C-3112.

Descriptors: *Pollutant identification, *Testing procedures, *Analytical techniques, *Monitoring, Evaluation, Water quality, Water pollution, Measurement, Testing, On-site tests, Water analysis, Chemical analysis, Iron, Lead, Magnesium, Zinc, Nitrates, Chlorides, Fluorides, Sulfates, Copper, Separation techniques.
Identifiers: *Ring oven technique, *Water test kit, Spot tests, Colorimetric tests, Field test kit, Thomas oven model E-10, Ring oven procedures, Iron content, Lead content, Nitrate content, Sulfate content.

The feasibility of using spot tests coupled with ring oven separation for the monitoring of selected species in natural water sources was demonstrated. The species investigated and their concentration ranges were: iron (0.1-10 ppm), lead (.05-1.0 ppm), magnesium (10-5000 ppm), zinc (1-20 ppm), chlorides (10-20,000 ppm), fluorides (0.1-10.0 ppm), nitrates (1.0-20 ppm), sulfates (10-3000 ppm), copper (0.1-5 ppm), calcium (20-10,000 ppm), cadmium (0.01-0.1 ppm), chromium (0.01-1 ppm), cyanide (0.1-5 ppm), manganese (0.02-2 ppm), and phosphate (0.02-2 ppm). FECAL COLIFORM ANALYSIS: EFFECTS OF ELEVATED TEMPERATURES ON QUANTITATIVE RECOVERY,
Missouri Univ., Rolla. Dept. of Life Science.
J. B. Hufham.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 361, Price codes: A02 in paper copy, A01 in microfiche. Missouri Water Resources Research Center, Rolla, Completion Report, October 12, 1976. 11 p, 4 fig, 5 ref. OWRT A-089-MO(1), 14-34-0001-6026.

Descriptors: *E. coli, Water quality, Temperature, Water pollution, *Coliforms, *Cultures, *Isolation, *Pollutant identification, Analytical techniques.

The theoretical concept of cell and culture death resulting from increased temperature is important to an understanding of the inaccuracy of the fecal coliform test procedure. Results of study on the differential effects of temperature on various types of membrane filters show that the type of filter is an important variable. Recoveries of known densities of pure cultures of E. coli varied from 10-70 percent from this variable alone. The importance of selection of the proper temperature for membrane evaluation cannot be stressed too strongly. Results show that the interaction of the membrane with the cell, resulting in loss of cell viability, is temperature dependent and varies from brand to brand. A modified fecal coliform procedure has been developed and field tested. This new procedure lessens the detrimental effects of the temperature on recovery of the organism.

WATER-BORNE VIRUSES: THEIR CHARACTERIZATION BY RAMAN SPECTROSCOPY,
Connecticut Univ., Storrs. Inst. of Water Resources.
C. N. Burke, W. H. Nelson, and T. Girshick.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 354, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, 1976. 6 p, 2 fig, 1 ref. OWRT A-055-CONN(1), 14-31-0001-4007.

Descriptors: *Viruses, *Centrifugation, *Public health, Water quality, *Spectroscopy, *Pollutant identification.
Identifiers: *Water-borne viruses, *Raman spectroscopy, *Density gradient centrifugation, Concentration methods, *Laser techniques, Temperature effects.

The research was designed to test raman spectrographic methods for sensitivity and specificity in identifying selected water-borne viruses, concentrating on those known to be pathogenic for man. Virus stocks of both DNA and RNA nucleic acid types, including Polio I, Sinbis, Vaccina and Vesicular stomatitis, were prepared and concentrated by density gradient centrifugation, using both sucrose and cesium chloride. Titrations of the viruses at several points were done using both plaque forming units and cytopathic effects in determining endpoints. Due to problems with instrumentation and especially virus concentration methods, raman spectrographic scans for prototype viruses did not result in clear-cut reproducible spectra. The differential centrifugation methods used did not provide a concomitant increase in titratable numbers of virus with reduction in total suspension volume. Although titration end-point determinations suggested levels as high as 10 to the 10th power to 10 to the 12th power had been achieved, spectra did not conform to theoretical numbers of viruses. The effects of using various laser sources and of temperature associated degradation, which may account for the theoretically high numbers of virus needed for satisfactory laser readings, may have also contributed to the unsatisfactory results. Other concentration methods are being considered. (de Lara-Connecticut)

LASER METHODS OF RAPID DETECTION, IDENTIFICATION AND QUANTITATION OF HUMAN ENTERIC VIRUSES IN SEWAGE AND RIVERS,
Rhode Island Univ., Kingston. Dept. of Chemistry.
W. H. Nelson, and P. W. Chang.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 358, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, September 1, 1976. 32 p, 16 fig, 4 tab, 10 ref. OWRT A-058-RI(1). 14-34-0001-6041.

Descriptors: Spectroscopy, *Viruses, *Pollutant identification, Enteric bacteria, Sewage, Instrumentation, Analytical techniques.
Identifiers: *Laser methods, *Raman spectroscopy, *Poliovirus, *Enteric viruses.

This study has shown that it is possible to obtain Raman spectra of poliovirus in water solution. Since a Raman spectrum can be obtained in minutes or even seconds, in principle, it has been demonstrated that very rapid analysis of viruses is possible. Details of virus preparation, purification, and concentration have been discussed. Polio I spectra are similar to those of plant viruses studied previously, but are sufficiently different to allow spectra to be used for identification purposes. Problems of instrument sensitivity and rapid sample preparation have to be overcome before a virus analysis machine based upon Raman spectroscopy can be used routinely.
W77-02184

OPTICAL REMOTE SENSING OF WATER POLLUTANTS,
Georgia Inst. of Tech., Atlanta. Engineering Experiment Station.
J. J. Gallagher, and J. B. McManus.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 346, Price codes: A03 in paper copy, A01 in microfiche. Georgia Environmental Resources Center, Atlanta, Report ERC 0876, August 1976, 23 p., 3 fig, 3 tab, 11 ref. OWRT A-046-GA(1). 14-31-0001-4010.

Descriptors: Pollutants, *Fluorescence, *Remote sensing, Instrumentation, *Pollutant identification, *Analytical techniques, Monitoring, Pulp wastes, Measurement.
Identifiers: *Raman effect, Optical scattering, Argon laser, Pulp mill effluence.

Calculations have been performed to compare three optical scattering processes for remote sensing of water pollutants. The relative merits of the Raman effect, the resonance Raman effect and fluorescence are discussed. The greater intensity of the fluorescence signal must be considered in comparing these techniques for remote sensing. Other factors such as quenching, absorption and multiple scattering must, in turn, be studied. Instrumentation of laser sources applicable to water pollutants monitored has been investigated to identify sources currently available for light scattering experiments. Preliminary measurements of Raman scattering using a single monochromator, an argon ion laser as the excitation source and photon counting techniques have been performed.

AN ECOSYSTEM ANALYSIS OF ENVIRONMENTAL CONTAMINATION BY LEAD,
Illinois Univ. at Urbana-Champagn. Inst. for Environmental Studies.
G. L. Rolfe, and A. Haney.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-248 593, Price codes: A07 in paper copy, A01 in microfiche. Report to National Science Foundation, August 1975. 133 p. 30 tab., 25 fig., 13 ref.

Descriptors: *Lead, *Metals, *Distribution patterns, *Path of pollutants, Water pollution, *Illinois, Toxicity, Ecological distribution, *Air pollution, Air-water interfaces, Sediments, Freshwater fish, *Food chains, Aquatic animals, Aquatic plants, Freshwater fish, Environmental gradients, Insects, Air-earth interfaces, Watersheds(Basins).
Identifiers: *Tetraethyl lead, Ecosystem analysis, Environmental contamination, *Saline branch watershed(Ill).

An 86-square-mile watershed in east-central Illinois, predominantly agricultural with a small urban area, was studied to determine the movement of lead into and through the area. The accumulation of lead in the terrestrial and aquatic biota were also examined. Combustion of gasoline was found to be the major source of lead input, accounting for 29,000 kg per year. Of this amount, about 13,000 kg remain airborne while 16,000 kg are deposited at ground level. Lead leaves the watershed at a rate of 910 kg per year through drainage water. The balance, 14,800 kg or 92.5 percent of the annual input, remains within the watershed. Lead concentrations in air, soils, stream sediments and the terrestrial and aquatic biota were determined. At present lead concentrations there is no apparent adverse effect on plants and animals. No biological magnification was discovered except in insect food chains. The major lead reservoirs are the soils (9 x 105 kg), plants (4 x 103 kg), and stream sediments (3 x 103 kg). The highest lead concentrations and a major portion of the stored lead are associated with the urban region and with areas adjacent to high-use rural roads. (Katz)

TUBIFICIDS (OLIGOCHAETA: TUBIFICIDAE) - INDICATORS OF THE QUALITY OF WATER BODIES, (IN RUSSIAN),
Akademiya Nauk Latvilskoi SSR, Riga. Inst. of Biology.
E. A. Parele, and E. B. Astapenok.
Latv Psr Zinat Akad Vestis 9, p 44-46, 1975.

Descriptors: Benthos, *Oligochaetes, *Tubificids, *Bioindicators, Europe, *Worms, Water quality, Water pollution, *Pollutant identification.
Identifiers: Latvian-SSR, USSR, Tubificid-aquatic plant associations.

Slightly setaceous worms have the leading role in the freshwater benthos of the Latvian SSR (USSR). Statistical material obtained on oligochaetes in large streams in 1962-1971 showed that tubificid-plant associations can be used as indicator organisms. By mathematical treatment of the data, standard coefficients D2, D3 and D4 weren obtained indicating the degree of the stream saprobiont. To determine coefficient D2, data on the total number of oligochaetes and turbificids is sufficient. To determine coefficients D3 and D4 all species of tubificids must be known.--Copyright 1976, Biological Abstracts, Inc.

THE MERCURY CONTENT OF MOLLUSKS IN THE PONTEVEDRA ESTUARY AS A MEASURE OF ITS DEGREE OF MERCURY CONTAMINATION, (IN SPANISH),
Institut Espanol de Oceanografia, Madrid (Spain). Central Labs.
J. Aravia Torre, and C. Masso.
Bol Inst Esp Oceanogr 191, p 1-10, 1975.

Descriptors: *Mercury, *Mollusks, *Pollutant identification, Estuaries, Water pollution sources, Europe, Clams, Industrial wastes, Pulp wastes, Mussels.
Identifiers: Cockles, Caustic soda, Pontevedra estuary(Spain), Arosa estuary(Spain)

A paper pulp factory and a caustic soda and Cl producing plant on the Pontevedro estuary, NW Spain, contaminated the bay with Hg. The Hg con-

tent of bay mollusks (clams, cockles, mussels) was compared with that of mollusks in a nearby unpolluted bay of the Arosa estuary. Contamination was found in a limited zone near the factories. In mussels 20 ppm Hg was found; 10 ppm was found in clams, and 12 ppm in cockles. The Hg content of mollusks declined rapidly with distance from the contamination source. In the uncontaminated Arosa estuary the average Hg content of fresh mussels was 0.014 ppm. At distant points in the contaminated bay, Hg content in mollusks dropped to 0.03 ppm or lower. The official danger level is 0.50 ppm; mollusk consumption is not restricted.--Copyright 1976, Biological Abstracts, Inc.

SOME ASPECTS OF MUNICIPAL OVERFLOW RESERVOIR MONITORING, (IN SWEDISH),
Uppsala Kommun (Sweden). Halsovard Forvaltning.
C. Forsberg, and S. O. Ryding.
Vatten 31(4), 347-358, 1975.

Descriptors: *Chlorophyll, *Monitoring, *Municipal water, Reservoirs, Vegetation, Nitrogen, Water supply, Phosphorus, *Overflow, Organic matter, *Pollutant identification.
Identifiers: *Sweden.

The effects of vegetation and other variable factors were studied by analyzing chlorophyll a is surface waters of lakes used as overflow reservoirs for the city of Uppsala, Sweden, including lakes Kyrkviken, Ramsjoen and Uttran during the period from May-Oct. for several years. A remarkable variability was recorded; seasonal average values do not reflect water quality. N,P and organic material were measured weekly and monthly and related to water flow for the river Fyris during the whole year of 1973 showing the variation of transport and the effect of sample averaging. Analytical procedures are recommended for testing water quality for overflow water reservoirs. A typical situation is plotted showing the 8 sites where water samples should be analyzed, including sites of inflow of natural waters, sites of outflow, and points where inflow occurs from purification works, where N is important and varies with the input quantity. Test should be made inside the reservoir at points remote from inflow and outflow, and should include 3-5 samples of surface water during vegetation periods and samples from 0-2 m in depth. Another location for analysis represents the influx of P and N from forest and cultivated land. For continual control of water quality, salt, pH, suspended material, organic material, chlorophyll a, N, phosphate P and total P must be determined. Industrial activity, climate and temperature may modify sampling frequency and the degree to which samples can be mixed. Water quality records should reflect actual conditions. Often procedures can be simplified by analyzing mixed samples, but base data are necessary and vary in different communities.--Copyright 1976, Biological Abstracts, Inc.

EMISSION SPECTROMETIC ELEMENT DETERMINATION IN THE NANO- AND PICOGRAM REGION AFTER VAPORIZATION OF THE ELEMENTS WITH GAS PLASMAS INDUCED WITH MICROWAVES: I. EXTREMELY SENSITIVE MERCURY DETERMINATION IN AQUEOUS SOLUTIONS, AIR ORGANIC AND INORGANIC MATERICES, (IN GERMAN),
Max-Planck-Institut fuer Metallforschung, Stuttgart (West Germany).
G. Kaiser, D. Goetz, P. Schoch, and G. Toelg.
Talanta 22(10/11), p 889-899, 1975.

Descriptors: *Mercury, *Pollutant identification, *Spectrophotometry, Analytical techniques, Trace elements, Measurement, Aqueous solutions.

The Hg in substances to be tested is quantitatively enriched by cementation or electrolytic precipitation on Cu and amalgamation with Ag or Au. It is then vaporized into Ar plasma by heating the carrier metals, and the light emitted is measured with a spectral photometer. All steps of the process are optimized with 203 Hg so that 0.05 ppm Hg may be detected in drinking water, surface water and sewage and may be measured simply and accurately in air and in organic and inorganic matrices. The absolute limit of detectability is 0.1 ng and the coefficient of variability is = or < 10%; the procedure takes about 15 min.--Copyright 1976, Biological Abstracts, Inc.

BIOLOGICAL MONITORING: SUBSTANTIATION AND EXPERIENCE IN ORGANIZATION, (IN RUSSIAN),
Moscow State Univ. (USSR).
V. D. Fedrov.
Gidrobiol Zh 11(5), p 5-11, 1975.

Descriptors: *Monitoring, *Bioindicators, *Bacteria, Biomass, Potable water, Phytoplankton, Productivity, Respiration, Water supply, Europe, *Pollutant identification, Reservoirs.
Identifiers: Substantiation, *Ucha Reservoir(USSR).

Observation and experiment should be the main methods of collecting information in a biological monitoring system. Biological indices are conveniently divided into 2 categories: functional, i.e., the rate of change of some function (indices of productivity, respiration, assimilation, etc.), and structural, i.e., some result of an action at the time of recording (biomass, number of species, content of matter in the system, etc.). These principles were used in setting up a program and organizing biological (phytoplankton, bacterioplankton) monitoring on the Ucha reservoir supplying Moscow (Russian SFSR, USSR) with drinking water.--Copyright 1976, Biological Abstracts, Inc.

EXTRACTION-PHOTOMETRIC DETERMINATION OF MERCURY IN SOIL AND WATER, (IN RUSSIAN),
Uzhgorod State Univ. (USSR).
P. P. Kish, G. M. Vitenko, V. A. Sabov, and V. I. Buletsa.
Gig Sanit 11, p 74-76, 1975.

Descriptors: *Mercury, *Pollutant identification, *Photometry, *Soil analysis, *Water analysis, Separation techniques, Analytical techniques, Ions.

A proposed method of extraction-photometric determination of microquantities of Hg in soil and water is based on the extraction by benzene of the ion association formed by the anionic I complex of Hg with the action reagent methyl violet. The method is highly sensitive and permits simultaneous concentration and determination of Hg from greatly diluted solutions containing Hg to 0.002 microgram/ml. The determination of Hg is not disturbed by the presence of Zn,Cd,Mn,Co,Cu,Fe,Al,Pb,Cr or some other elements. The method is distinguished by good reproducibility and accuracy.--Copyright 1976, Biological Abstracts, Inc.

COMPARISON OF METHODS FOR THE DETERMINATION OF TOTAL PHOSPHORUS IN WATERS CONTAINING PARTICULATE MATERIAL,
Massey Univ., Palmerston North (New Zealand). Dept. of Soil Science.
P. W. O'Connor, and J. K. Syers.
Journal of Environmental Quality, Vol. 4, No. 3, 1975. p 347-350, 4 tab, 18 ref.

Descriptors: *Phosphorus, Water quality, Water quality control, Water sampling, Sediments, *Pollutant identification, Methodology, Analytical techniques.

Perchloric acid digestion compared favorably with Na2CO3 fusion for the determination of total P in a range of waters containing varying concentrations of both P and particulate material. The recovery of particulate P by persulfate digestion tended to decrease with increasing particulate material concentration in both natural unfiltered samples and in filtered samples to which particulate material was added. Recovery of added soil particulate P by persulfate digestion also decreased with increasing particle size. Low recovery of P by persulfate digestion was caused by the incomplete extraction of P occluded within oxides and hydrous oxides of iron. Between 58 and 86% of the P not recovered by persulfate digestion

U. OF I. URBANA-CHAMPAIGN

was in the inorganic form. Persulfate digestion is not recommended for the determination of total P in waters containing particulate inorganic materials of soil origin. Perchloric acid digestion is considered to be a more suitable method for such samples. (Skogerboe-Colo St)

WATER-QUALITY STUDY OF A REACH OF THE MERCED RIVER IN YOSEMITE NATIONAL PARK AND VICINITY, CALIFORNIA--APRIL 1973 THROUGH SEPTEMBER 1974,
Geological Survey, Menlo Park, Calif. Water Resources Div.
R. J. Hoffman, A. E. Dong, and G. L. Keeter.
Open-file report 76-326, August 1976. 66 p, 7 fig, 17 tab, 19 ref.

Descriptors: *Water quality, *Baseline studies, Sewage treatment, *Water analysis, *Chemical analysis, Biological properties, Chemical properties, Physical properties, Data collections, *California, Treatment facilities.
Identifiers: *Yosemite National Park(Calif), Preconstruction, Sewage plants.

A 25-mile reach of the Merced River was studied to provide the U.S. National Park Service with water-quality data prior to the operation of a new sewage treatment plant. Water-quality variables investigated were discharge, temperature, major chemical constituents, selected trace metals, specific conductance, suspended sediment, turbidity, dissolved oxygen, pH, total alkalinity, carbon dioxide, total organic carbon, nitrogen, phosphorus, algal growth potential, coliform bacteria, periphyton, and benthic invertebrates. Results indicate that water in the reach of the Merced River studied is a dilute system of good quality. Mean concentrations of nitrogen and phosphorus were highest in the Merced River at Rancheria Flat. Algal growth potential tests revealed that phosphorus was limiting algal growth at Happy Isles Bridge, El Capitan Bridge, and South Fork Merced River, which nitrogen was limiting it at Rancheria Flat. Input of excessive nitrogen and phosphorus concentrations in the Merced River during the summer low-flow period, and mixing with warm tributary inflow could cause excessive algal growth and production. FLUID SAMPLER AND OXYGEN METER FOR SEWAGE PROCESSING - BIOLOGICAL OXYGEN DEMAND DETAILED CONTINUOUSLY BY REACTION VESSEL READ-OUT.
French Patent FR 2289-451. Issued August 4, 1975.
Derwent French Patents Abstracts, Vol. X, No. 36, p D3-D4, May 28, 1976.

Descriptors: *Patents, *Biochemical oxygen demand, *Sewage treatment, *Monitoring, *Activated sludge, Biological treatment, Aeration, Equipment, Analytical techniques, Instrumentation, *Pollutant identification.

A patent for a biochemical oxygen demand metering device which can be used in activated sludge type sewage treatment installations is described. The device has a reaction vessel which constantly receives a sample from the aeration tank and through which air is caused to flow. A vent is provided to allow air leaving the liquid sewage to escape into the atmosphere. Air from the vent can be conducted to an oxygen metering instrument in a second section of the device. A third section of the reactor is provided for feeding in the liquid sample, and a fourth section takes overflow back to the aeration tank. The device provides continuous biochemical oxygen demand readings in a minimum amount of time and is protected from soiling, clogging, and corrosion. (Kreager-FIRL)

CORRELATION OF BOD, COD AND SOLUBLE ORGANIC CARBON,
ADI Ltd., Fredericton (New Brunswick).
T. Viraraghavan.
Journal Water Pollution Control Federation, Vol. 48, No. 9, p 2213-2214, September, 1976. 2 tab, 4 ref.

Descriptors: *Carbon, *Organic compounds, *Biochemical oxygen demand, *Chemical oxygen demand, *Waste water(Pollution), Sewage, Groundwater, Septic tanks, Effluents, Analytical techniques, Solubility, Statistics, *Pollutant identification.
Identifiers: *Organic carbon(Soluble).

The degree of correlation between soluble organic carbon and oxygen demand (biochemical and chemical) was investigated for samples of raw sewage, septic tank effluent, and polluted groundwater. Biochemical and chemical oxygen demand were estimated by using the procedures in Standard Methods, and soluble organic carbon was measured by analyzing the filtrates of samples filtered through 24.25-centimeter glass fiber filters for organic carbon. The correlation coefficients between soluble organic carbon and biochemical or chemical oxygen demand for raw sewage and septic tank effluent were not significant at the 5% level; polluted groundwater also failed to show a significant correlation at the 5% level for soluble organic carbon and biochemical oxygen demand, although the correlation between the former and chemical oxygen demand was significant at the 1% level. Thus, the use of soluble organic carbon as a measure of organic matter in waste water should be made with caution. (Kreager-FIRL)
W77-02376

DETERMINATION OF CHEMICAL OXYGEN DEMAND (DIE BESTIMMUNG DER CHEMISCHEN OXIDIERBARKEIT),
F. J. Sprenger.
Vom Wasser, Vol. 46, p 125-138, 1976. 1 tab, 10 ref.

Descriptors: *Chemical oxygen demand, *Analytical techniques, Waste water(Pollution), *Organic compounds, *Oxidation, Chemical reactions, Kinetics, Temperature, Acidity, Alkalinity, Chlorides, *Pollutant identification.
Identifiers: Oxidizing agents, Potassium permanganate, Potassium dichromate.

The determination of chemical oxygen demand in water with dissolved organic compounds is discussed. Chemical oxygen demand determinations are made by oxidizing the organic matter in the water as completely as possible so that carbon dioxide and water are the final products. Preferred oxidizing agents include potassium permanganate in alkaline or acid solutions and potassium dichromate in acid solution. Generally, higher rates of oxidation are achieved with the latter compound. Although higher rates of oxidation may be obtained by increasing temperature and sulfuric acid concentration of the sample, secondary effects involving the simultaneous oxidation of chlorides rule out such means as being practical. (Kreager-FIRL)

INSTANTANEOUS METERING AIDS - ACTIVATED SLUDGE PLANT,
Suffolk County Dept. of Environmental Control, Hauppauge, N. Y. Operations Div.
B. A. Matzner.
Water and Wastes Engineering, Vol. 13, No. 8, p 18-20, August, 1976.

Descriptors: *Pollutant identification, *Analytical techniques, *Monitoring, *Suspended solids, *Aeration, *Biological treatment, Activated sludge, Nitrification, Denitrification, Sewage treatment, Waste water treatment, Liquid wastes, Feasibility, Performance, Evaluation Measurement, Treatment facilities, On-site investigations, Automation.

The feasibility of using an automatic instrument for the instantaneous measurement of mixed liquor suspended solids in the aeration tank of an activated sludge municipal treatment plant with extended aeration nitrification and suspended growth denitrification was demonstrated. The analyzer consists of two parts connected with cables: a sensing probe (mounted on the downflow side in the center of the aeration tank) and a remotely located indicator assembly which gives a direct digital readout in ppm. In the event of a decrease in solids in the mixed liquor, the analyzer alerts the operator to introduce additional solids into the aeration tank. When the solids reach the top of the optimum ppm range, as indicated by the automatic analyzer, the operator turns off the return sludge system and begins wasting sludge from the clarifiers. Continuous testing of the analyzer at the sewage treatment plant indicates that the instrument is reliable and provides an accurate measure of mixed liquor suspended solids. (Kreager-FIRL)
W77-02381

A STUDY OF BACTERIAL AEROSOLS AT A WASTEWATER IRRIGATION SITE,
Army Medical Bioengineering Research and Development Lab., Frederick, Md.
C. A. Sorber, H. T. Bausum, S. A. Schaub., and M. J. Small.
Journal Water Pollution Control Federation, Vol. 48, No. 10, p 2367-2379, October, 1976. 7 fig, 7 tab, 13 ref.

Descriptors: *Irrigation, *Air pollution, *Aerosols, *Bacteria, *Waste water treatment,

*Water reuse, Recreation facilities, On-site investigations, Sprays, Chlorination, Microorganisms, Efficiencies, Coliforms, Public health, *Pollutant identification.
Identifiers: Klebsiella.

A 4-week field study at a golf course irrigated with chlorinated secondary effluent was conducted to obtain data for a model designed to predict pathogen levels downwind from the spray source. Bacterial aerosols significantly above background were demonstrated at 198 m downwind from the nozzle, the greatest distance tested. At 152 m from the source, total aerobic counts of about 100/cu m and coliform-like counts of about 30/cu m were recorded. Among the isolates confirmed as coliforms biochemically, 58% were assigned to the genus Klebsiella; this is of public health significance since these bacteria are capable of producing respiratory and other infections in man. In two runs where chlorination was practiced, the mean reduction in total aerobic count observed at the irrigation spray nozzle was 99.6%, illustrating the effectiveness of this treatment for controlling the microbial aerosol problem. ANALYTICAL METHODOLOGIES FOR LEACHATE AND GAS ANALYSIS,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
E. S. K. Chian, and F. B. DeWalle.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 44-53. 4 fig. 15 ref.

Descriptors: *Pollutant identification, *Leachate, *Landfills, *Analytical techniques, *Sampling, *Chemical analysis, Conductivity, Color, Turbidity, Suspended solids, Nitrogen, Chemical oxygen demand, Physical properties, Chemical properties, Colorimetry, Heavy metals, Organic compounds.

Techniques for sampling and analyzing leachate samples from landfills are discussed. Strict anaerobic sampling and storage conditions are necessary to prevent extensive changes from occurring in the leachate sample prior to analysis. Samples should be stored in glass bottles for organic analysis and in plastic bottles for heavy metal analysis. The sequence of parameter analysis should be: oxidation-reduction potential, color, turbidity, suspended solids, pH, and conductivity. Other parameters such as chemical oxygen demand and organic nitrogen may also change directly after sampling, but these changes can be reduced by acidifying the sample. Chemical analysis using colorimetric methods is strongly interfered with by color, suspended solids, and high salt concentrations in the leachate. These interfering effects can be reduced by using a standard addition method or by diluting the leachate sample with increasing amounts of water to determine whether the interfering effect can be sufficiently reduced. MONITORING TOXIC CHEMICALS IN LAND DISPOSAL SITES,
Illinois State Water Survey, Urbana.
W. H. Walker.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 123-129. 3 fig, 1 ref.

Descriptors: *Monitoring, *Landfills, *Groundwater, *Sampling, *Cores, Chemical analysis, Soil tests, Water pollution, Waste disposal, Solid wastes, *Pollutant identification.

Toxic chemical monitoring at landfill sites is discussed. Recent studies indicate that well monitoring systems may not be the most effective means to trace chemical pollutant flow paths or to determine groundwater chemical concentrations at any time or depth. Instead, chemical analyses of core samples from the underlying earth material profile may be preferred since these allow for a positive definition of any chemical constituent within the profile at any given location. This is true regardless of whether the chemicals are present in precipitated form in the zone of aeration, are held by retention on soil particles in the semisaturated fringe, or are dissolved in groundwater within the zone of saturation. Core sample monitoring is also faster and more economical than well monitoring. The number of sampling points required is primarily controlled by the expected variability of each parameter and the degree of monitoring accuracy desired. Initial soil core test probes which are made to obtain background data should be placed at the center of each sampling station. (See also W77-02394) (Kreager-FIRL)

AN EVALUATION OF WATER QUALITY INFORMATION: A CASE STUDY OF STREAMS IN METROPOLITAN NEW JERSEY,
Rutgers - The State Univ., New Brunswick, N. J. Dept. of Geography.
R. M. Hordon.
Trans Ill State Acad Sci. 66(3/4), p 105-114, 1973.

Descriptors: *New Jersey, *Water quality, Urbanization, Data collections, Streams, River basins, Bacteria, Alkalinity, Color, Temperature, Hydrogen ion concentration, Dissolved oxygen, Computer programs, Biochemical oxygen demand, Pollutant identification, Turbidity.
Identifiers: Raritan River basin(NJ).

Some of the best water quality data sets available in New Jersey are routinely collected by large public potable water supply agencies. One set consisted of 11 variables (temperature, dissolved oxygen, turbidity, color, discharge, percent saturation, hardness, alkalinity biological oxygen demand (BOD), pH and bacteria) collected every week at 3 sites in the Raritan River Basin. Factor analysis using the Varimax rotation resulted in 3 factors: an oxygen-related factor (high inverse loadings on dissolved oxygen and temperature), an appearance factor (turbidity, color and discharge), and a 3rd variable factor occasionally loading on percent saturation. The cumulative percentage explained by the rotated factors declined during the decade, suggesting an increase in independence developing among the variables. It is hypothesized that urbanization with its commensurate changes in land use and runoff patterns might be intervening in the natural ecology of the stream. The effects of urbanization would interfere with instream interaction among the variables. Factor structures were quantitatively compared from year to year and from site to site by a computer program called RELATE.--Copyright 1975, Biological Abstracts, Inc.

DIRECT OF X-RAY SPECTROMETRIC DETERMINATION OF BROMINE IN WATER,
Geological Survey of Israel, Jerusalem. Geochemical Dept.
Y. Deutsch.
Anal Chem. 46(3), p 437-440, 1974.

Descriptors: *Pollutant identification, *Bromine, *X-ray spectroscopy, Water analysis, Spectroscopy.

A rapid X-ray spectrometric method for the routine determination of bromine in water is based on the normalization of the background intensity of the sample to the background intensity of a pure water sample. Results agree fairly well with results of the standard oxidation reduction method. X-ray results for synthetic samples are very good, with a maximum error of 2%.--Copyright 1974, Biological Abstracts, Inc.

MONITORING WATER QUALITY FROM LANDSAT.
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
J. L. Barker.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-11543, Price Codes: A03 in paper copy, A01 in microfiche. Preprint X-923-75-190, July 1975. 33 p, 18 fig, 7 tab.

Descriptors: *Remote sensing, *Virginia, *Water quality, *Reservoirs, Satellites(Artificial), Data processing, Reflectance, Turbidity, Suspended solids, Land use, Mapping, Runoff, *Monitoring, Measurement, Pollutants, Water pollution sources, *Pollutant identification.
Identifiers: *LANDSAT, Areal measurements.

Water quality monitoring possibilities from LANDSAT were demonstrated both for direct readings of reflectances from the water and indirect monitoring of changes in use of land surrounding Swift Creek Reservoir in a joint project with the Virginia State Water Control Board and NASA. Film products were shown to have insufficient resolution, and all work was done by digitally processing computer compatible tapes. It was

WATER RESOURCES SCIENTIFIC INFORMATION CENTER U. S. DEPT. OF THE INTERIOR WASHINGTON, D. C. 20240

shown that areas of individual water bodies could be measured from LANDSAT with an accuracy that decreased from + or - 1% at 500 hectares to + or - 8% at 5 hectares. LANDSAT reflectances from water in the visible (MSS-4 and MSS-5) and near-infrared (MSS-6) spectral bands were shown to be nearly perfectly correlated and spatially coherent for both Swift Creek Reservoir and Lake Chesdin Reservoir, which has a ten times greater flow rate due to input from the Appomatox River. Perhaps the greatest potential contribution of LANDSAT is through indirect interpretation by detecting changes in land cover in a watershed. Land cover maps of the 18,000 hectare Swift Creek Reservoir watershed were prepared for two dates in 1974. A significant decrease in the pine cover was observed in a 740 hectare construction site within the watershed. A measure of the accuracy of classification was obtained by comparing the LANDSAT results with visual classification at five sites on a U-2 photograph. Such changes in land cover can alert personnel to watch for potential changes in water quality. (Sims-ISWS)

REMOTE SENSING OF EFFECTS OF LAND-USE PRACTICES ON WATER QUALITY,
Kentucky Univ., Lexington. Dept. of Forestry
D. H. Graves.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-15525, Price codes: A02 in paper copy, A01 in microfiche. Report NASA CR-144105, December 1975. 17 p, 3 ref, 2 append. NASA NAS8-31006.

Descriptors: *Remote sensing, *Land use, *Forests, *Water quality, Satellites(Artificial), Aircraft, Aerial photography, Data processing, Watersheds(Basins), Vegetation, Vegetation effects, Surveys, *Pollutant identification.
Identifiers: *LANDSAT.

Six watersheds having a total area of 539 hectares (1330 acres) comprised the study area. All six study watersheds were forested, but two had been partially surface mined. One watershed had been fertilized with ammonium nitrate, and another was tentatively scheduled for logging in the summer of 1976. The other two watersheds were utilized as controls. Vegetative ground truth survey was begun in February, 1975. The ground truth survey of forest types was completed by May 1, 1975. Receipt in May of 1:24,000 MSS and CIR imagery from the April 7, 1975 NASA aircraft over-flight of the study areas permitted vegetative typing of the reclaimed sites. Water quality and quantity information was collected for each study watershed. Each watershed was instrumented with a weir, water stage recorder, and precipitation gage. Weekly grab samples were taken at each weir and analyzed for several water quality parameters. Physical parameters measured included turbidity, temperature, and suspended sediment. It was mentioned that color infrared and multispectral imagery from the aircraft overflights and LANDSAT imagery were to be used for land classification and change detection. Also, aircraft and satellite multispectral imagery was to be color enhanced, and the resultant enhanced imagery was to be utilized to supplement the data yield of the primary imagery. Several types of land use change were indicated by LANDSAT imagery and color composites. Appendixes contain two papers recently presented. (Sims-ISWS)

Geological Survey, Lawrence, Kans.
H. L. Yarger, and J. R. McCauley.
Available from the National Technical Information Service, Springfield, VA 22161 as N76-17460, Price codes: A03 in paper copy, A01 in microfiche. Report NASA-CR-144505, Final Report, EREP No. 540G-1, 38 p, July 1975. 16 fig, 3 tab, 2 ref, 1 append. NAS-9-13271.

Descriptors: *Reservoirs, *Water quality, *Impounded waters, Water properties, *Suspended solids, *Kansas, Impoundments, Surface waters, Domestic water, Recreation, Eutrophication, Mineralogy, Nutrients, Water analysis, Water chemistry, Suspension, Satellites(Artificial), Water resources, Dissolved solids, *Pollutant identification.
Identifiers: *SKYLAB, *Mineral constituents, Inorganic sediment, Reflected energy, Artificial reservoirs, Algal nutrients.

Apparent reflectance lvels inl the SKYLAB S190A and S192 bands from one pass over three Kansas reservoirs, exhibit good statistical correlation with suspended solids. Band ratios appear to yield the best results. The concentration of suspended solids, mostly inorganic sediment, has the most effect on the reflected energy. Dissolved solids concentrations up to 200 ppm were not detectable by the SKYLAB sensors. (Henley-ISWS)

BIO-REFRACTORY INDEX FOR ORGANICS IN WATER,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
F. L. Hart, and T. Helfgott.
Water Research, Vol 9, p 1055-1058. 1975. 3 tab, 12 ref. OWRT A-030-CONN(8), 14-31-0001-3007.

Descriptors: *Organic compounds, *Aquatic environment, Persistence, *Oxygen demand, *Nitrogen, Industrial waste, Laboratory tests, *Biodegradation, *Pollutant identification, Degradation(Decomposition)
Identifiers: *Refractory index, *Degree of degradation.

A method of classifying specific aquatic borne organic materials according to degradability is presented. Laboratory procedures and rationale are given for the development of a parameter referred to as the Refractory Index (R.I.). Examples of refractory index values and significance are offered. Representative data are presented for which there is roughly a 13% relative error for each R.I. value. Materials characterized as refractory (having a low R.I. value) are persistent for the conditions stipulated in the ultimate BOD test and therefore low R.I. indicates persistence in the water environment. Materials having low R.I. values should not be discharged in receiving waters unless extensive examinations show that the material can be effectively removed by treatment or does not cause harmful effects in the aquatic environment. A SENSITIVE ALGAL ASSAY: AN IMPROVED METHOD FOR ANALYSIS OF FRESHWATERS,
Connecticut Univ., Storrs. Inst of Water Resources
R. L. Klotz, J. R. Cain, and F. R. Trainor
Journal of Phycology, Vol. 11, No. 4, p 411-414, 1975. 1 fig, 6 tab, 10 ref. OWRT A-052-CONN(13), 14-31-0001-3807.

Descriptors: *Bioassay, *Aquatic algae, Freshwater, *Carrying capacity, *Connecticut, Pollutant identification, Nutrients.
Identifiers: *Algal assay, Dilute medium, *Selenastrum, *Sensitive assay, *Nutrient-poor rivers, Willimantic/Shetucket River(Conn), Natchaug River.

An algal assay capable of detecting the carrying capacity of nutrient-poor rivers was developed. In order to eliminate carry-over of nutrients, thus masking the true nutrient condition of the water tested, a new growth medium was developed. This maintenance medium contained less than 4 mg/l total inorganic salts. With an inoculum of 10⁴ cells/ml the test organism Selenastrum capricornutum Printz was grown in sterile-filtered river water and transferred daily with a 1:1 dilution. The assay was carried out for 4 or 5 days, at which time cell number was calculated, and the doublings per day were determined. Comparisons are made with similar but less sensitive assays, on the basis of both daily and 5-day readings. (de Lara-Connecticut)

DISTRIBUTION OF AQUATIC YEASTS - EFFECT OF INCUBATION TEMPERATURE AND CHLORAMPHENICOL CONCENTRATION ON ISOLATION,
Connecticut Univ., Noank. Marine Research Lab.
J. D. Buck
Mycopathologia, Vol. 56, No. 2, p 73-79, 1975. 1 fig, 4 tab, 30 ref. OWRT A-052-CONN(14). OWRT 14-31-0001-3807

Descriptors: *Yeasts, *Aquatic microorganisms, Rivers, Estuaries, *Marine fungi, Temperature, *Incubation, *Connecticut, Coasts, Isolation, Sewage treatment, Filters, Membranes, Filtration, Waste water treatment.
Identifiers: *Chloramphenicol, *Candida, *Torulopsis, *Membrane filter techniques.

Fresh (river), estuarine and marine waters in and along the coastline of Connecticut were cultured by the membrane filter technique at 20 and 37C on a complex medium containing 0-1000 mg/l of chloramphenicol. Using counts on medium with 500 mg/l antibiotic as a base, ratios of total and pink yeast counts were recorded for other chloramphenicol concentrations at both temperatures for the waters sampled. Variable results were obtained. In general, both total and pink yeast counts decreased with increasing antibiotic levels, being most apparent at 400 mg/l chloramphenicol. Medium without antibiotic and with 100 mg/l always produced bacterial overgrowth. A total of 209 white yeasts were isolated from all platings; the genera Torulopsis, particularly T. candida, and Candida were dominant with lesser numbers of Cryptococcus, Trichosporon sporogenous genera, and Kloeckera. Most species isolated were found on media at all chloramphenicol levels. Comparisons were made of yeast distributions in these temperate waters with reports from other areas. (de Lara-Connecticut)

Ohio State Univ., Columbus. Dept. of Microbiology.
M. A. Patrick, V. K. Sanger, and P. R. Dugan.
Mycologia, Vol. 65, No. 1, p. 122-127, Jan.-Feb., 1973. 2 tab, 14 ref. OWRT A-024-OHIO(2).

Descriptors: *Lipids, *Gas chromatography, *Pollutant identification, Chromatography, Analytical techniques, Organic compounds, Organic acids.
Identifiers: *Smittium culisetae, *Thin-layer chromatography, Triglycerides, Diglycerides, Fatty acids, Steroids.

Neutral and polar lipids of Smittium culisetae were separated by silicic acid column and thin-layer chromatography. 76.3% of the total lipids was found to be neutral lipids and 23.7% was polar. Triglycerides were the most abundant (26.6%) of the lipids with lesser amounts of free fatty acids, steriods and diglycerides. The major phosphatide was phosphatidyl choline (17.8%) while phosphatidyl ethanolamine and phosphatidyl serine were present in smaller amounts. Gas chromatography of methyl esters of the fatty acids obtained from the individual lipid classes showed that the most abundant unsaturated fatty acid was palmitoleic (38.7%) and the predominant saturated fatty acid was palmitic (34.3%). Descriptors: *Pulp wastes, *Organic compounds, Aerated lagoons, *Discharge(Water), Wastes, Industrial wastes, Water pollution sources, Phenols, Acids, Liquid wastes, Aromatic compounds, Organic wastes, Waste treatment, Waste water treatment, Water pollution treatment, Water pollution control, Pulp and paper industry, Washington, Pacific Northwest U. S., Effluents, *Pollutant identification.
Identifiers: Terpenes, Resin acids, Fatty acids, Sugar acids, Terpineol, Camphor, Kraft mills.

Organic compounds entering and leaving kraft mill aerated lagoons have been identified and determined quantitatively. The compounds found included terpenes, resin and fatty acids, phenols, and sugar acids. The terpenes,resin and fatty acids are similar to those present in the wood species being pulped. Some terpenes, phenols, and sugar acids are produced during the pulping reactions. About 8 ppm total terpenes were found in the lagoon influent and 1 ppm or less in the effluent. Alpha-terpineol was the major compound entering the lagoon, and camphor the main terpene in the effluent. The total resin acid concentration entering the lagoon was 3.2 ppm, with 0.6 ppm leaving. Fatty acids were lower, both entering and leaving the lagoon. Sugar acids were entering at about 100 ppm, but were usually eliminated in the lagoon. Terpenes can be controlled by in-process steam stripping, and the other compounds can be partially controlled by in-plant spill containment. (Witt-IPC)

CHEMICAL CATALYST INTERFERENCE IN THE WINKLER TITRATION DETERMINATION OF DISSOLVED OXYGEN -- A METHOD FOR CORRECTION,
Mixing Equipment Co., Inc., Rochester, N.Y.
M. B. Lakin.
Water Research, Vol. 10, No. 11, p 961-966, 1976. 2 fig, 5 ref.

Descriptors: *Water analysis, *Dissolved oxygen, Catalysts, *Volumetric analysis, Cobalt, Chemical precipitation, Oxidation, Analytical techniques, Chemical analysis, Water chemistry, Water quality, *Pollutant identification.
Identifiers: *Winkler test, Sodium sulfite.

A new procedure involving the measurement of a chemical blank is introduced to correct the cobalt interference effect associated with the Winkler titration analysis for dissolved oxygen. Unsteady-state reaeration studies employed for mechanical aerator evaluation tests show that when sodium sulfite is used in the presence of a cobalt ion catalyst to deoxygenate the test basin water, a chemical interference is detected in the Winkler determination of dissolved oxygen content. The interference is attributed to a chemical precipitate that forms in the reaeration process. Evidence suggests that the Co(II) ion is oxidized to the (III) oxidation state forming a cobalt (III) hydroxide in the alkaline test environment. Upon acidification of the test samples during the Winkler procedure, the CO(III), a powerful oxidizing agent, is released and in turn effects an increase in the amount of free iodine released and measured by titration. The additional iodine liberated in this manner yields erroneous oxygen concentration values which are then used to calculate the oxygen mass transfer coefficient. Considerable deviation from the true value of the coefficient can result. (Witt-IPC)

SEPTIC TANK EFFLUENT MOVEMENT THROUGH SOIL,
Maine Univ. at Orono. Dept. of Soil Chemistry.
E. G. Lotse.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 368, Price codes: A05 in paper copy, A01 in microfiche. Maine Land and Water Resources Institute, Orono, Completion Report, June 1976. 71 p, 30 fig, 6 tab, 22 ref. OWRT A-029-ME(1).

Descriptors: Soils, Phosphorus, Nitrogen, Sorption, Effluents, *Septic tanks, *Nutrient removal, *Path of pollutants, Maine, Nitrates, Dispersion, Diffusion, Soil water movement, Ammonium, Water pollution sources, Waste water treatment.
Identifiers: Septic tank effluent, *Phosphorus removal, *Nitrogen removal, Adsorption fields(Septic tanks).

The rate and extent of phosphorus and nitrogen movement in selected Maine soils were studied under continuous and intermittent loading. Conditions approximating those of septic tank adsorption fields were simulated. For intermittently operated columns, there was no breakthrough of phosphorus when 8.0, 12.4 and 15.0 pore volumes of effluent, respectively, had been collected. For continuously operated columns, however, breakthrough occurred at 10.8 and 11.2 pore volumes, respectively. The greater the hydraulic loading, the greater was the rate of phosphorus movement through a given soil. Septic tank adsorption field systems should have several trenches and large total length of trench in order to minimize the movement of phosphorus and contamination of groundwaters. Nitrate breakthrough occurred before one pore volume of effluent had been collected from each column. The rate of diffusive and dispersive transport appeared to be low compared to the rate of convective transport. Ammonium breakthrough occurred when 2.5 to 6.5 pore volumes of effluent had been collected. The rate of ammonium movement was higher under continuous loading than under intermittent loading conditions. The septic tank adsorption field system is inefficient in removing nitrogen from sewage effluents.

A SUBMODEL FOR NITROGEN RELEASE FROM SEDIMENTS,
Copenhagen Univ. (Denmark). Freshwater Biological Lab.
O. S. Jacobsen, and S. E. Jorgensen.
Ecological Modelling, Vol. 1, No. 2, p 147-151, July 1975. 1 fig, 2 tab, 18 ref.

Descriptors: *Model studies, *Nitrogen, Nutrients, *Sediments, Anaerobic conditions, Aerobic conditions, Organic matter, Fertilization, Decomposing organic matter.
Identifiers: *Nitrogen release.

A submodel for the aerobic and anaerobic nitrogen release from sediment is set up. The rate of nitrogen release R is correlated to the nitrogen content by the following equations: R sub AN=84S sub N + 1.6 (anaerobic); R sub AE=58S sub N + 1.9 (aerobic); where: S sub N is mg N/ml in the sediment. The influence of temperature is included by use of an exponential expression, since the release is governed by a biochemical decomposition of organic matter. (Skogerboe-Colo St)

CHARACTERIZATION OF URBAN RUNOFF,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
W. Whipple, Jr, B. B. Berger, C. D. Gates, R. M. Ragan, and C. W. Randall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 459, Price codes: A02 in paper copy, A01 in microfiche. Summary Report, September 1976, 21 p. OWRT C-5341 (No 4239) (5).

Descriptors: *Water quality, Water pollution, Heavy metals, Nutrients, Suspended solids, Sewers, *Urban hydrology, *Storm drains, Biochemical oxygen demand, *Urban runoff, Organic wastes, Sediments, Storm runoff.
Identifiers: Urban runoff pollution, Storm hydrograph loading, Storm event loadings, Unrecorded pollution.

A joint effort to characterize urban runoff was conducted by five universities. The project objective was to contribute to improved technology for analysis of undesirable effects of unrecorded pollution in heavily developed areas, including heavy metals, nutrients, suspended solids and BOD. Use was made of individual samples and of continuous sampling throughout storm hydrographs. Some streams and storm sewers studied had a single outlet, but larger rivers were sampled above and below the urban area, using mass balance analysis to determine the pollution entering the stream between the two points. The latter method presented considerable problems. The results confirmed previous findings that urban areas contribute substantial amounts of organic, nutrient and suspended sediment pollution, with commercial and industrial areas contributing more than residential areas. Similar findings were made for heavy metals, with concentrations of lead in urban runoff approximating those for phosphorus. A special study indicated no support for the widely used hypothesis that pollution loadings in urban runoff vary as the length of time since the previous storm. More data are contained in individual reports by the five contributing universities.

THERMAL PLUMES IN THE KANSAS RIVER,
Kansas Water Resources Research Inst., Manhattan.
Y. S. Yu, and S. K. Kaul.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 351, Price codes: A03 in paper copy, A01 in microfiche. Contribution No. 182, August 1976. 33 p, 8 fig, 13 tab, 5 ref, append. OWRT A-066-KAN(1). 14-31-0001-5016.

Descriptors: *Thermal properties, *Kansas, *Thermal pollution, Velocity, Themperature, Thermodine, Distribution patterns, Path of pollutants, Electric power plants.
Identifiers: *Kansas River(Kan), Shallow streams, *Thermal plumes.

A case study of the heated discharge from the Tecumseh Power Plant into the Kansas River was conducted to determine the velocity and temperature distributions in the near field of the thermal plume in a reach about 350 ft long. The stream flow was 460 cfs with an average depth about 2 to 3 ft. The heated discharge from a submerged outlet 4 ft in diameter was 40 cfs and the measured initial temperature rise after passage of condensors was 40 deg F. The results show that the presence of a relatively stagnant region immediately upstream from the heated effluent affected significantly the shape and temperature distribution in the near-field of the plume. The outer boundary of the plume extended more than 10 pipe diameters upstream from the outlet and the maximum width of spreading across the stream was 12 diameters. The temperature rise in a vertical water column was not uniform but decreased with increasing depth from the surface. No ambient water was present beneath the plume. The decay of maximum temperature rise with the longitudinal distance was slow in the region less than 10 diameters and became rapid beyong that.

Descriptors: *Water pollution, *Water quality *Model studies, *Simulation analysis, Minnesota Wisconsin, Methodology, Waste disposal, Wast treatment, Waste water treatment, Industri wastes, Domestic wastes, Water quality, Oxyger *Oxygen demands, *Oxygen sag, Great Lakes Lake Superior, Sewage treatment, River basins.
Identifiers: *Duluth-Superior Area(Minn-Wisc *Lower St. Louis River basin(Minn-Wisc), Bes practicable technology, Effluent limits, Benthi oxygen demands.

The Lower St. Louis River Basin from Brooksto to Lake Superior was sampled in late 1973. Th resultant data were combined with historical dat for verification of a water quality model--the S Louis River Basin Model, developed under separate contract (EPA No. 68-01-1853). Th model was used to evaluate the effect on wate quality of implementing effluent limits using be: practicable technology and best availab technology for industrial discharges, and second ry treatment for municipal waste sources, required by the 1972 Amendments to the Feder Water Pollution Act. The study indicates that in plementation of the above effluent limits, as we as utilization of a centralized treatment plant advanced design, will result in a significant in provement in water quality in the Lower St. Lou River. However, with current benthic oxygen d mand rates, DO in the reservoirs is projected border on noncompliance at summer low flov even with essentially zero discharge of pollutan from industrial and municipal sources in th Cloquer area. EXCHANGE OF NUTRIENTS AND TRAC METALS BETWEEN MARSH SEDIMENTS AN ESTUARINE WATERS - A FIELD STUDY,
Clemson Univ., S. C. Dept. of Chemistry a Geology.
L. R. Gardner.
Available from the National Technical Inform tion Service, Springfield, VA 22161 as PB-261 49 Price codes: A06 in paper copy, A01 in microfich South Carolina. Water Resources Research I stitute, Clemson, Report No. 63, September 197 95 p, 13 fig, 6 tab, 64 ref, 2 append. OWRT B-05 SC(5).

Descriptors: *Marshes, *Estuaries, *Silic *Phosphorous, Alkalinity, Metals, Water qualit Simulation analysis, *South Carolina, Trace el ments, Nutrients, Sediments, Estuarine enviro ment, *Path of pollutants, Copper, Zinc, Molyb lenum, Water pollution sources.
Identifiers: *Trace metals, *Marsh sediments.

Some of the effects of marshes on the quality adjacent coastal waters are described and some the mechanisms of materials exchange betwe

marshes and estuaries are identified. Data were collected on the quantity and quality of runoff from marshes during low tide exposure and on the chemistry of interstitial waters and marsh sediments. The results indicate that marshes export phosphorous and silica in amounts comparable to the supply of these elements by terrestrial stream flow and that marshes take up Cu, Zn and Mo but at rates so low that the effect on the concentrations of these elements in coastal waters is immeasurably small. The export of silica and phosphorous from marshes is due chiefly to the diffusion of these substances from the sediment into a thin layer of water on the marsh surface that slowly drains during low tide exposure. A mathematical simulation of the process was formulated which qualitatively fits the observed pattern of silica concentration in the runoff.

THERMAL EFFECTS ON BIODEGRADATION OF POLLUTANTS IN WATER,
Memphis State Univ., Tenn. Dept. of Biology.
C. G. Hollis.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 912, Price codes: A03 in paper copy, A01 in microfiche. Research Report No. 53, December 3, 1976. 29 p, 8 fig, 1 tab, 37 ref. OWRT A-037 TENN(1).

Descriptors: *Biodegradation, *Linear alkyl sulfonates, Water pollution, Water quality, *Thermal pollution, Water temperature, Organic compounds, Organic wastes.
Identifiers: *Linear alkyl benzenesulfonates, Trace organics.

The rate of biodegradation of linear alkyl benzenesulfonate was increased as temperature was increased from 5C to 35C in 10C increments. At 45C and 55C, the compound was not degraded. Biodegradation was enhanced by acclimatizing the sewage seed to LAS when compared to using unacclimatized seed and seed acclimatized to temperature only. Carbon chain degradation, sulfate removal and benzene ring opening of the LAS molecule were somewhat simultaneous and were influenced by incubation temperatures. The presence of glucose in the reaction mixture retarded the rate of LAS carbon chain biodegradation. The data suggest thermal pollution would increase the rate by which trace amounts of biodegradable organic compounds, such as LAS, would be degraded in water.

Florida Water Resources Research Center, Gainesville, Publication No. 38, September 10, 1976. 50 p, 21 fig, 4 tab, 20 ref, append. OWRT A-026-FLA(10). 14-34-0001-6010.

Descriptors: Infiltration, Irrigation, Herbicides, Fertilizers, Kinetics, Sorption, Soils, Path of pollutants, *Sands, *Florida, Irrigated land, Leaching.
Identifiers: Trickle irrigation.

The simultaneous movement of water and selected agrichemicals (fertilizer nutrients and herbicide) through sandy soils is of particular importance to the efficient use of fertilizers and irrigation water by agricultural crops. Efficient use of fertilizers and herbicides applied to Florida's sandy soils is desirable for maintaining optimum growth of plants and for minimizing groundwater contamination. Laboratory and field experiments as well as mathematical models were used to study water and solute (potassium and phosphorus nutrients and 2,4-D herbicide) transport in two representative Florida soils: Wauchula sand and Troup sand. In an irrigated and fertilized corn experiment, grain yields and efficiency of water use were observed to be mutually related to both the irrigation and the fertilizer application treatments. Leaching of applied nutrients and irrigation water from the soil 'rooting zone' resulted in decreased water use efficiency in these soils. Mathematical models were developed and used to simulate transport and chemical-physical reactions for potassium, phosphorus and 2,4-D herbicide in these soils. Reactions such as adsorption-desorption, chemical precipitation and immobilization (fixed) greatly influenced the movement and thus potential leaching of these solutes through the soil.

NITROGEN IN THE SOIL WATER OF THE ECOSYSTEM OF THE AMAZONIAN PRAIRIES, (IN PORTUGESE),
Instituto Nacional de Pesquisas da Amazonia Manaus (Brazil).
A. Dos Santos, and M. D. G. Ribeiro.
Acta Amazonica 5(2), p 173-182, 1975.

Descriptors: *Nitrogen, *Soil water, Ecosystems, South America, Vegetation, Metabolism, Microorganisms, *Grasslands, Seasonal, Decomposing organic matter, *Biodegradation.
Identifiers: *Brazil, Prairies, *Amazonian prairies(Brazil).

The main sources of N in the soil water of the ecosystem of the Amazon campina (Brazil) are decomposing material, (litter), water running off the vegetation and the byproducts of the metabolism of microorganisms. Water samples from the watertable at 4 white sand sites (regosol) were analyzed for NH4, NO2 and NO3 and the concentration of organic N and total N were calculated. There was a greater concentration of organic N present than in that from other origins. NH4-N was the principal product of the formation of organic material by microorganisms and it had the 2nd largest concentration; NO3 and NO2 were almost always absent because of the soil acidity (pH 3.0). There are annual and seasonal variations in the N compounds. The greatest quantities were obtained in the middle of the dry season. On white sand N is not a limiting factor for the development of the natural vegetation.--Copyright 1976, Biological Abstracts, Inc.

ANALGOLOGICAL SURVEY OF THE SONDELEDFJORD NEAR RISOR, S. NORWAY: A 'LAND-LOCKED' FJORD EXPOSED TO POLLUTION, (IN NORWEGIAN),
Oslo Univ. (Norway). Inst. of Zoology.
J. P. Nilssen.
Blyttia 33(1), p 17-26, 1975.

Descriptors: *Fjords, *Algae, Cyanophyta, Estuaries, Sewage, *Littoral, Salinity, Temperture, Surveys, Outfall sewer, Pulp wastes, Oxygen, Chlorophyta, Path of pollutants, *Water pollution.
Identifiers: *Norway, Polysiphonia-hemisphaerica, Sills, *Analgological surveys.

The algal vegetation in the littoral zone in the Sondeledfjord near Risor, S Norway is described. A review is given of the physical and chemical condition in the fjord. The estuary is moderately brackish, having a salinity all year of approximately 20%. The temperature and salinity gradients are considerable; thus water renewal seldom occurs in the deep. The sills are numerous and between them are stagnant waters. The fjord is open at both ends; this, together with the number of sills, exposes it to further pollution. The pollutants, domestic sewage and pulp mills, mostly come from the neighboring areas. The structure of the different algal communities is dependent upon the distance from a sewer outfall. In the vicinity of an outfall the algal community was dominated by green and blue-green algae. This may be due to interspecific competition, light, O2 condition, amount of sewage, exposure, water movements, etc. Two characteristic algal profiles and the distribution of Polysiphonia hemisphaerica are given.--Copyright 1976, Biological Abstracts, Inc.

CASE OF SUBSURFACE WATER POLLUTION BY PETROLEUM PRODUCT WASTES, (IN RUSSIAN),
Meditsinskii Institut, Tselinograd (USSR).
N. I. Anan'Ev, A. A. Kyuregyan, and L. A. Rybina.
Gig Sanit 10, p 97-98, 1975.

Descriptors: *Oil pollution, *Oil wastes, *Water pollution sources, Water supply, Industrial wastes, Path of pollutants, Chemical analysis, *Pollutant identification, Subsurface waters.

Identifiers: Kazakh-Ssr, USSR, *Alekseevka(USSR).

The water supply of the city of Alekseevka (Kazakh SSR, USSR) is obtained from fissure waters of Ordovician granitoids by means of 10 wells. In Dec. 1973 petroleum products began to appear in the tap water. Petroleum wastes poured onto the soil surface and into primitive settling tanks by industrial plants were the source of pollution. These plants were located on high ground and the petroleum products penetrated along the fissures to the groundwater level. Metal tanks are presently being used for temporary waste storage. Chemical analysis revealed a decrease in the content of petroleum products in the water. Some time is required before they disappear entirely from the aquifer.--Copyright 1976, Biological Abstracts, Inc.

NITROGEN LOSSES FROM SOILS OF THE NORTH CAROLINA COASTAL PLAIN,
North Carolina State Univ., Raleigh. Dept. of Soil Science.
R. P. Gambrell, J. W. Gilliam, and S. B. Weed.
Journal of Environmental Quality, Vol. 4, No. 3, p 317-323, 1975.

Descriptors: *Nitrogen, *Denitrification, *Nutrients, Soils, Soil investigations, Drainage, Drainage effects, Fertilizers, Fertilization, *North Carolina, Return flow, Sediments, Corn(Field), *Coastal Plains.

Nitrogen balances were measured for a moderately well-drained and a poorly drained soil in the North Carolina Coastal Plain to evaluate the effect of drainage on the fate of unutilized fertilizer N. Approximately one-half of the fertilizer N applied to each soil was not utilized by the crop. Most of the nitrogen lost by surface runoff from both soils was organic nitrogen associated with the sediment. However, there was a measurable increase in loss of nitrogen from fertilized plots as compared to unfertilized plots. The poorly drained soil (27% organic matter) had approximately 50% less surface runoff than did the moderately well-drained soil (2% organic matter). However, the concentration of N in runoff from the poorly drained soil was almost twice as great resulting in nearly identical N losses from the two soils. Much of the total surface loss of N from corn occurred during the first few months after planting. (Skogerboe-Colo St)

A BIVARIATE-REGRESSION MODEL FOR ESTIMATING CHEMICAL COMPOSITION OF STREAMFLOW OR GROUNDWATER,
Geological Survey, Lakewood, Colo. Water Resources Div.
T. D. Steele.
Hydrological Sciences Bulletin, Vol 21, No 1, p 149-161, March 1976. 3 fig, 6 tab, 23 ref.

Descriptors: *Water quality, *Computer models, *Network design, Streams, Groundwater, Regression analysis, Chemical analysis, Data collections, Computer programs, Statistical methods, Data storage and retrieval.
Identifiers: *SYSLAB programs.

Regression between concentrations of major inorganic constituents and either specific conductance or streamflow discharge characterize chemical-quality conditions at a sampling site or of an area and can be used to estimate streamflow chemical-quality composition over time and in space where information is lacking or deficient. In this manner, less costly water quality network operations may be achieved for a given programme, enabling available resources to be reallocated to the collection and analysis of data where information is deficient. The SYSLAB system is a sequential set of documented special-purpose computer programs for statistically and graphically analysing historical water-quality records and deriving relevant regression relationships based upon this analysis. These computer programs have been applied under a variety of hydrological conditions to characterize regional chemical-quality patterns across the United States and in Pakistan. Case-study results using the proposed methodology are presented for Nigeria, Japan, and Pakistan. (Woodard-USGS)

MODELING COLIFORM-BACTERIA CONCENTRATIONS AND PH IN THE SALT-WEDGE REACH OF THE DUWAMISH RIVER ESTUARY, KING COUNTY, WASHINGTON,
Geological Survey, Tacoma, Wash. Water Resources Div.
W. L. Haushild, and E. A. Prych.
Open-file report 76-415, 1976. 43 p, 11 fig, 4 tab, 22 ref.

Descriptors: *Water quality, *Model studies, *Coliforms, *Hydrogen ion concentration, *Estuaries, *Washington, Mathematical models, Data collections, Evaluation, Equations, Salinity, Water temperature, *Bacteria, Decomposing organic matter, *Path of pollutants.
Identifiers: *Duwamish River estuary(Wash), King County(Wash).

Total- and fecal-coliform bacteria, plus pH, alkalinity, and dissolved inorganic carbon are water-quality parameters that have been added to an existing numerical model of water quality in the salt-wedge reach of the Duwamish River estuary in Washington. The coliform bacteria are modeled using a first-order decay (death) rate, which is a function of the local salinity, temperature, and daily solar radiation. The pH is computed by solving a set of chemical-equilibrium equations for carbonate-bicarbonate buffered aqueous solutions. Concentrations of total- and fecal-coliform bacteria computed by the model for the Duwamish River estuary during June-September 1971 generally agreed with observed concentrations within about 40 and 60 percent, respectively. The computed pH generally agreed with observed pH within about a 0.2 pH unit; however, for one 3-week period the computed pH was about a 0.4 unit lower than the observed pH. (Woodard-USGS)

MOVEMENT OF HEAVY METALS BELOW SEWAGE DISPOSAL PONDS,
California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
L. J. Lund, A. L. Page, and C. O. Nelson.
Journal of Environmental Quality, Vol. 5, No. 3, p 330-334, July-September, 1976. 7 fig, 4 tab, 10 ref.

Descriptors: *Heavy metals, *Sewage disposal, *Sludge disposal, *Soil analysis, *Treatment facilities, Zinc, Cadmium, Copper, Chromium, Nickel, Chemical oxygen demand, Metals, Ponds, Soil chemical properties, Soil contamination effects, Soil investigations, On-site investigations, Solubility, Sewage treatment, *Path of pollutants.
Identifiers: Metal-organic complexes.

The extent of downward movement of zinc, cadmium, copper, chromium, and nickel in coarse-textured soils beneath sewage sludge and effluent disposal ponds at two sewage treatment plants was investigated. Concentrations of acid-extractable metals were greater under disposal ponds than at offplant control sites at both treatment plants. Metal enrichment was evident at depths as great as 3 m under some ponds; and zinc, cadmium, copper, chromium, and nickel levels at this depth ranged as high as 75, 10, 30, 30, and 70 micrograms/gram, respectively. The depth and degree of metal enrichment depended on the specific pond type and the treatment plant. Metal concentrations

were greater under anaerobically digested sludge-holding ponds than under effluent ponds. Concentrations of the metals in saturation extracts of soils beneath the ponds were much greater than those typically found for California soils. The distributions of the metals with depth were closely related to changes in chemical oxygen demand of soil samples with depth, suggesting that the metals were transported as soluble metal-organic complexes. INTERACTIONS OF FERRIC AND FERROUS IRONS AND ORGANIC MATTER IN WATER ENVIRONMENT,
Tokyo Metropolitan Univ. (Japan). Dept. of Chemistry.
T. Akiyama.
Geochem J. 7(3), p 167-177, 1973.

Descriptors: *Iron, *Organic matter, *Chemical precipitation, Iron compounds, Environment, Iron oxides, Algae, Bacteria, Biodegradation, *Chlorophyta, Dissolved solids, Lipids.

Coprecipitation of organic matter with ferric and ferrous hydroxide, and Fe holding in a solution containing organic matter were experimentally studied. The dissolved organic matter from bacterial degradation of green algae was used. Ferrous Fe, as well as ferric Fe, coprecipitate organic matter under reduced conditions and ferric and ferrous irons selectively coprecipitate proteinous materials. On the contrary, pigment and lipid materials are rarely coprecipitated and hold ferric Fe in dissolved form probably by forming water soluble Fe-organic complexes. The significance of the interaction of organic matter and Fe in their cycle in the hydrosphere is shown.--Copyright 1974, Biological Abstracts, Inc.

THEORETICAL APPROACH TO GAS MOVEMENT THROUGH SOILS,
Ohio State Univ., Columbus. Dept. of Civil Engineering.
C. A. Moore.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 33-43. 22 fig, 2 ref.

Descriptors: *Landfills, *Gases, *Methane, *Mathematical models, *Waste disposal, Solid wastes, Physical properties, Chemical properties, Soil physical propperties, *Path of pollutants.

A mathematical model for predicting the flow of gases around sanitary landfills is presented along with some preliminary results. The mathematical analogue decouples the physical characteristics of the gases, the porous medium, and the areal geology. Interactions between the gas and the liquid or solid phases can be incorporated into the analogue through equilibrium equations. A solution to the analogue, assuming a 70% methane level in the landfill for 5 years and no excess total pressure, yields the following information: the maximum radial extent of the 5% methane level above the elevation of the landfill base extends for 1.28-2.25 times the radius of the landfill, depending on the perviousness of the ground surface; decay to below 5% methane requires from 1 to over 150 years; decomposition times in excess of 5 years result in further excursion of the 5% methane level; as the porosity of the soil increases, the 5% methane excursion distance increases; a small degree of perviousness of the ground surface is very effective in reducing the 5% methane excursion; vents are effective in reducing methane concentrations along a radial line passing through the vent but are essentially useless in reducing methane along radial lines a few degrees away from the line through the vent; and circumferential trenching can significantly reduce methane concentrations. LEACHATE ATTENUATION IN UNDISTURBED AND REMOULDED SOILS,
Waterloo Univ. (Ontario). Dept. of Civil Engineering.
G. J. Farquhar, and F. A. Rovers.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 54-70. 14 fig, 8 tab, 15 ref.

Descriptors: *Attenuation, *Leachate, *Soils, *Landfills, Analytical techniques, Solid wastes, Soil types, Soil tests, Soil water, *Path of pollutants, Waste dilution.

Soil attenuation of landfill leachate was studied by comparing the flow and contaminant removal patterns in columns containing both undisturbed and remoulded samples of the same soil. A significant degree of attenuation by dilution was provided by the water retained in the soil below the field capacity. Remoulded soils provided more attenuation by dilution than did undisturbed soils. When flow conditions were intergranular, the use of remoulded soil columns for estimating attenuation was acceptable; thus, the estimation of attenuation using dispersed soil reactors corrected for the degree of dilution appears to be acceptable. Removal isotherms constructed from dispersed soil studies can be used to predict the breakthrough curves for some contaminants. This can be accomplished for contaminants where the isotherms constructed from dispersed soil studies are linear. (See also W77-02394) (Kreager-FIRL)

LEACHATE MIGRATION THROUGH SELECTED CLAYS,
Illinois State Geological Society, Urbana.
R. A. Griffin, and N. F. Shimp.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 92-95.

Descriptors: *Migration, *Leachate, *Attenuation, *Landfills, *Clay minerals, *Chemical analysis, Mercury, Lead, Zinc, Cadmium, Calcium, Iron, Manganese, Chemical oxygen demand, Waste disposal, Solid wastes, Ion exchange, Ions, Metals, Montmorillonite, Kaolinite, Illite, Path of pollutants.

Leachate migration through three different clay minerals was investigated as part of an effort to evaluate the potential use of clay as a liner for landfills. Montmorillonite clay exhibited the strongest attenuatioN, being about four times more effective than illite and five times more effective than kaolinite. Mercury, lead, zinc, and cadmium were the components most strongly attenuated by the clays. Calcium, iron, and manganese showed on attenuation. Chemical oxygen demand showed a relatively low attenuation. Adsorption studies revealed that the most important factors affecting the prediction of a given metal ion's migration under a solid waste disposal site are the pH of the solution, the cation exchange capacity of the clay, and the ionic composition of the solution matrix. A computer simulation model was written to predict metal ion migration through clay columns. (See also W77-02394) (Kreager-FIRL)

ORGANIC POLLUTANTS CONTRIBUTED TO GROUNDWATER BY A LANDFILL,
Robert S. Kerr Environmental Research Lab., Ada, Okla.
W. J. Dunlap, D. C. Shew, J. M. Robertson, and C. R. Toussaint.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 96-110. 7 fig, 4 tab, 21 ref.

Descriptors: *Groundwater, *Landfills, *Leachate, *Waste disposal, *Water pollution, Chemical analysis, Organic compounds, Domestic wastes, Solid wastes, Leaching, On-site investigations, *Path of pollutants.

Groundwater from a well within a landfill and from a control well was sampled using a modified low-flow carbon adsorption procedure to determine the contribution of organic compounds to groundwater resulting from the disposal of refuse. Column chromatography, solubility separation, and gas chromatography/mass spectrometry measurements revealed low levels of many undesirable organic chemicals in the groundwater which were apparently leached from the landfill. More than 40 compounds were identified, most of which were chemicals commonly employed in industry for the manufacture of domestic and commercial products. The source of these compounds was apparently manufactured products which were discarded in the landfill since it had not received appreciable wastes from industrial operations. The results demonstrated the potential for long-term pollution of groundwater as a result of solid waste disposal in landfills. (See also W77-02394) (Kreager-FIRL)
W77-02407

ATTENUATION MECHANISMS OF POLLUTANTS THROUGH SOILS,
Arizona Univ., Tucson. Coll. of Agriculture.
W. H. Fuller, and N. Korte.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 111-122. 4 fig, 7 tab, 6 ref.

Descriptors: *Attenuation, *Soil types, *Leachate, *Landfills, *Clay minerals, Chromium, Mercury, Nickel, Lead, Copper, Arsenic compounds, Beryllium, Cadmium, Zinc, Chemical analysis, Path of pollutants.
Identifiers: Vanadium, Selenium, Oxisols, Ultisols.

Soil columns were leached with a landfill leachate spiked with selected potentially hazardous elements to investigate soil attenuation mechanisms. The relative mobility of 11 trace elements in landfill leachate was ranked for 11 soils representing seven soil orders. The most generally mobile elements were chromium, mercury, and nickel; whereas the least mobile elements were lead and copper. The mobility varied with conditions for arsenic, beryllium, cadmium, selenium, vanadium, and zinc. The soil that was most effective in attenuating trace elements was Molokai, and Oxisol from Hawaii. Davidson, an Ultisol from North Carolina, ranked second in its immobilization effectiveness. Both soils are high in clay and extractable free iron oxides. The attenuation of other soils varied but generally ranked according to the amount of clay-sized particles in the soil. (See also W77-02394) (Kreager-FIRL)

NONPOINT-SOURCE POLLUTION IN SURFACE WATERS: ASSOCIATED PROBLEMS AND INVESTIGATIVE TECHNIQUES.
National Environmental Research Center, Las Vegas, Nev. Monitoring Applications Lab.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-243 995, Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA-680/4-75-004, June 1975. 47 p. 2 tab, 44 ref. 22AEB/002.

Descriptors: *Water pollution sources, *Pollutant identification, *Monitoring, *Sampling, Sediments, Runoff forecasting, Pesticides, Nutrients, Forest management, Erosion, Water sampling, Testing procedures, Remote sensing, Agricultural runoff, Acid mine water, Reservoirs, Dredging, On-site data collections, Laboratory tests, Automation.
Identifiers: *Nonpoint pollution sources.

Sediment--over 50% of it cropland runoff--is the principal non-point pollutant. Other contaminants include minerals and acids, pesticides, nutrients such as phosphorus and nitrogen, natural and synthetic organic wastes, heat, pathogenic microorganisms and radioactive materials. These pollutants are caused by food and forage cultivation, animal husbandry, silviculture, mining, construction of facilities, hydrographic modifications, channelization, impoundments, mining gravel from streams and dredging. Techniques are reviewed for predicting the rate and nature of pollution loading to a given waterway from all the major nonpoint-sources. Monitoring strategies and techniques applicable to identification and assessment of nonpoint-source contaminants are analyzed and compared for their utility in state programs aimed at water quality and pollution control. Various procedures are given for manual field sampling, automated sampling, use of automated contact sensors, remote sensors and aerial reconnaisance with a matrix of parameters to be considered in field and laboratory tests for pollutants. NUTRIENT DISTRIBUTIONS IN A SPODOSOL DURING CORN GROWTH,
Florida Univ., Gainesville. Dept. of Soil Science.
R. S. Mansell, L. W. Zelazny, L. C. Hammond, and H. M. Selim.
Soil and Crop Science Society of Florida Proceedings, Vol 34, p 24-29, December 1974. 9 fig, 2 tab, 15 ref. OWRT A-026-FLA(3). 14-31-0001-5009.

Descriptors: *Infiltration, Irrigation, Herbicides, Fertilizers, Soils, Kinetics, *Corn(Field), Growth rates, *Nutrients, Distribution, *Path of pollutants, Sorption.
Identifiers: Soil pH, Trickle irrigation, *Spodosol.

Distributions of K, P, NH4-N, and NO3-N in a tile-drained Wauchula sand (Spodosol) were determined under corn cultivation in the spring of 1974. Grain yields of 6,346 and 7,907 kg/ha were obtained from plots receiving 567 and 9,070 kg/ha of limestone, respectively. Nutrient distributions in the soil solution phase were used to describe nutrient movement with time in the soil profile. Movement of NO3-N, NH4-N, K, and Cl proceeded downward in the profile during the first 43 days. However, for times greater than 43 days downward movement of these nutrients did not exceed 50-70 cm depth. Restricted downward transport of nutrients was attributed to the presence of a slowly-permeable B'2t horizon located 75 cm from the soil surface. (Morgan-Florida)

MODELING REACTIONS AND TRANSPORT OF POTASSIUM IN SOILS,
Florida Univ., Gainesville. Dept. of Soil Science.
H. M. Selim, R. S. Mansell, and L. W. Zelazny.
Soil Science, Vol. 122, No. 2, p 77-84, 1976. 10 fig, 17 ref. OWRT A-026-FLA(9). 14-34-0001-6010.

Descriptors: Infiltration, Irrigation, Herbicides, Fertilizers, Soils, Kinetics, Sorption, *Potassium, *Path of pollutants, *Mathematical models.
Identifiers: Trickle irrigation.

A mathematical model was developed to describe potassium reactions and transport in soils. Kinetic reactions were assumed to govern the transformation between solution, exchangeable, nonexchangeable (secondary minerals), and primary mineral phases of potassium. Simulated results were presented for two soils, a weakly sorbing soil and a strongly sorbing soil. The effect of kinetic rate coefficients upon transport and transformation of applied potassium was also investigated. The model is flexible and can be adapted to incorporate various transformation mechanisms between the different phases of potassium. Model validation with the aid of experimental data is needed to further describe the fate of potassium in soil. (Morgan-Florida)

DISTRIBUTIONS OF 2,4-D AND WATER IN SOIL DURING INFILTRATION AND REDISTRIBUTION,
Florida Univ., Gainesville. Dept. of Soil Science.
H. M. Selim, R. S. Mansell, and A. Elzeftawy.
Soil Science, Vol 121, No 3, p 176-183, 1976. 10 fig, 22 ref. OWRT A-026-FLA(7). 14-31-0001-5009.

Descriptors: *2-4-D, *Distribution, *Path of pollutants, *Infiltration, Irrigation, Herbicides, Fertilizers, Soils, Kinetics, Sorption, Mathematical models, *Pesticides.
Identifiers: Soil pH, Trickle irrigation.

A numerical model was developed to predict transient water and reactive solute transport in water-unsaturated soil. An implicit-explicit method of finite difference approximation was used to simultaneously solve the water and solute flow equations. The model was used to calculate transport of water and 2,4-D (2,4-Dichlorophenoxyacetic acid) in a field profile of Lakeland fine sand during infiltration at constant intensities (2.08 and 4.10 cm/hr). Calculated values of the soil-water distributions compared well to experimental determinations, but agreement obtained between 2,4-D distributions was only adequate. Simulated results were also obtained to study the effect of irrigation intensity on water and herbicide transport during redistribution following irrigation. It was found that for advanced stages of redistribution, solute movement became negligible and the maximum herbicide concentration was located at the same depth in the soil profile regardless of irrigation intensity. (Morgan-Florida)

5C. Effects Of Pollution

EFFECTS OF SELECTED CHEMICALS ON MOVEMENT, GROWTH AND SURVIVAL OF CERTAIN AQUATIC ANIMAL LIFE,
Kansas Univ., Lawrence. Dept. of Physiology and Cell Biology.
E. C. Bovee
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 388, Price codes: A04 in paper copy, A01 in microfiche. Kansas Water Resources Research Institute, Lawrence, Completion Report, KWRRI Contribution No. 175, July 1976. 64 p, 12 fig, 13 ref, 3 append. OWRT B-040-KAN(1). 14-31-0001-5074.

Descriptors: Aquatic life, *Cadmium, *Calcium, *Cations, *Chemicals, *Chromium, *Copper, Effects, *Iron, *Lead, *Protozoa, *Toxicity, Animal growth, Heavy metals, *Aquatic animals, Water pollution effects.

Identifiers: Adenosine triphosphate, *Alleviation, Interactions, Paramecium, *Selenium, Tetrahymena pyriformis.

Since previous experiments with the protozoan, Tetrahymena pyriformis suggested that cations of heavy metals, (e.g., cadmium, in amounts of one part in 1 million parts of water) which often pollute industrial wastes act on the respiratory mechanisms which generate and store energy in the form of ademosine triphosphate (ATP), research was conducted to determine if certain substances (e.g., other metals) naturally present in freshwaters would counteract the toxic effects of the pollutants. Experiments showed calcium will offset the toxic effects of cadmium, somewhat if present in equal amounts, completely if in much greater amounts than the cadmium. Other experiments showed that iron will completely alleviate toxic effects of copper when the two are present in equal amounts (e.g., 5 to 15 parts per million of each in the water). Iron also proved to be stimulatory to growth (at those concentrations), whether or not the copper was present. Experiments were also done with movement and survival of protoza (e.g., Tetrahymena pyriformis and Paramecium caudatum). Toxic effects were found, but more data are required to determine the exact amounts of those metals which are toxic, and the discrete nature of the toxic effects.

IDENTIFICATION AND QUANTIFICATION OF WATER QUALITY CHANGE INDUCTING MECHANISMS IN STRATIFIED RESERVOIRS,
Tennessee Technological Univ., Cookeville. Dept. of Civil Engineering.
I. A. Gordon.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 366, Price codes: A06 in paper copy, A01 in microfiche. Research Report No. 54, October 6, 1976. 111 p, 46 fig, 22 tab, 62 ref. OWRT A-040-TENN(1). 14-31-0001-5043.

Descriptors: Reservoirs, Water quality, *Eutrophication, Nitrogen, *Dissolved oxygen, Iron, Phosphorus, *Nitrification, Bacteria, *Tennessee, Benthos, Stratification, Settling velocity, Thermocline, Muds, Anaerobic conditions, Manganese, Ammonia.
Identifiers: *Tims Ford Reservoir(Tenn), *Benthic muds.

Several mechanisms causing water quality changes in a deep stratified reservoir were identified and in many cases quantified. These mechanisms included several processes responsible for dissolved oxygen depletion, nitrogen transformations and addition of water quality constituents from the benthic muds. The mechanisms were identified from an analysis of data collected by the Tennessee Valley Authority from Tims Ford Reservoir near Winchester, Tennessee, during 1974 and 1975. Dissolved oxygen depletion occurred in three distinct depth zones and the depletion mechanisms were found to be different in each zone. A major finding was that the depletion in the area of the thermocline was related to increased concentrations of phytoplankton, bacteria and particulate organic matter in this zone. These increased concentrations were caused by a decreasing settling velocity gradient caused by rapidly decreasing temperatures in the thermocline. A model of this process was developed. The nitrogen transformation processes of nitrification, denitrification, ammonification and biological uptake were identified and assessed. Major changes of nitrogen compounds occurred during times of anaerobic conditions in the reservoir hypolimnion. Release rates of water quality constituents from the benthic muds were determined after anaerobic conditions had become established. Phosphorus, ammonia, organic nitrogen, iron and manganese were the major constituents released.

CHANGES IN BENTHOS AND FISHES OF A STREAM ACCOMPANYING A SUBSTANTIAL REDUCTION IN PLANT NUTRIENTS,
Pennsylvania State Univ., University Park. Dept. of Biology.
E. L. Cooper, and C. C. Wagner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 360, Price codes: A02 in paper copy, A01 in microfiche. Pennsylvania Institute for Research on Land and Water Resources, University Park, Completion Report, October, 1976. 17 p, 7 tab, 10 ref. OWRT A-039-PA(1). 14-31-0001-5038.

Descriptors: *Sewage effluents, Streams, *Eutrophication, *Benthos, *Fish, Brown trout, *Nutrient removal, Water pollution effects, *Pennsylvania, Water pollution control.
Identifiers: *Spray irrigation, Terrestrial ecosystems, Aquatic macrophytes, Residual chlorine, Slimy sculpins, Macrophytes, *Spring Creek(Penn).

Disposal of treated domestic sewage effluent into small streams contributes to excessive eutrophication and degradation of beneficial uses. Spring Creek has a recent history of becoming highly eutrophic. Currently, a pumping station and spray-irrigation system is nearing completion that will divert effluent and apply it to a terrestrial ecosystem. This report documents the 1975 status of aquatic macrophytes, benthos, and fishes from sections of Spring Creek, in anticipation of changes which may occur soon after effluent diversion. This before-and-after experiment, measuring changes in the biota, should document the efficacy of procedures of sewage diversion in reversing eutrophication of streams. Macrophytes increased in abundance from the upstream station above the effluent discharge to the station below the State College plant, but were completely absent from the lowest station below the new Houserville plant. Residual chlorine from the Houserville plant may cause the complete absence of plants downstream from this effluent. Conditions in 1975 continue to show marked differences between sections of Spring Creek above and below the sewage effluent discharges, compared with earlier data. Diversion of effluent from the stream should permit rapid recovery to conditions that existed before 1962 when the local sewage plant was greatly enlarged. (Sink-Pennsylvania State)

FATE AND EFFECTS OF OIL POLLUTANTS IN EXTREMELY COLD MARINE ENVIRONMENTS,
Louisville Univ., Ky.
R. M. Atlas.
Available from the National Technical Information Service, Springfield, VA 22161 as AD/A-003 554, Price codes: A03 in paper copy, A01 in microfiche. Report to Office of Naval Research, 31 December 1974, 36 p., 4 tab., 4 fig., 4 ref. ONR N00014-74A-0180-0001.

Descriptors: *Oil wastes, *Oil pollution, *Degradation, *Microbial degradation, *Chemical degradation, Microbiology, *Toxicity, Bioassay, Oil spill, Photosynthesis, Respiration, Fungi, Alaska, Arctic, *Cold regions, *Environmental effects, Path of pollutants, Marine biology.
Identifiers: *Oil biodegradation, *Alaskan waters, *Prudhoe Crude oil, Marine environment.

The biodegradability of different crude oils depended on their composition and temperature, heavier oils were more resistant to biodegradation, but lighter oils, while more susceptible to degradation at warm temperatures, contained volatile components that inhibited crude oil mineralization at reduced temperatures. It was possible to stimulate degradation of Prudhoe crude oil by fertilization and microbial seeding. Success of stimulated biodegradation depended on providing sufficient nutrients for extensive microbial metabolism in an oleophilic form and on the presence of appropriate oil degrading microorganisms for the given ecosystem. Microbial degradation did not increase toxicity to invertebrates test organisms. Amphipods were only killed by direct physical contact with oil slicks. The seed Pseudomonas sp. was not pathogenic or toxic to the bioassay organisms. Petroleum was found to inhibit microbial photosynthesis and nitrogen fixation, but not respiration. Chronically polluted areas had abnormally high numbers of fungi and low numbers of bacteria. Pristine Alaskan waters all contained microorganisms capable of oil biodegradation. (Katz)

OCCURRENCE OF KEROSENE-LIKE HYDROCARBONS IN THE BREAM, MYLIO AUSTRALIS GUNTHER,
Queensland Dept. of Primary Industries, Hamilton (Australia). Sandy Trout Food Preservation Research Lab.
D. W. Connell, K. Cox, and R. L. McLauchlan.
Australian Journal of Marine and Freshwater Research, Vol. 26, p. 419-422, 1975, 1 tab., 1 fig., 7 ref.

Descriptors: *Water pollution effects, *Oil wastes, *Commercial fish, *Taste, *Organoleptic properties, *Gas chromatography, *Pollutant identification, *Organic compounds, Gas chromatography, Analytical techniques.
Identifiers: *Bream, Mylio australis, *Alkanes.

Samples of the bream, Mylio australis from an area approximately 4 km north of the Brisbane River mouth have been found to contain a mixture of kerosene-like hydrocarbons, probably of petroleum origin rather than generated by internal metabolic processes. Capillary column gas chromatography and gas chromatography coupled with mass spectrometry permitted the unequivocal identification of a series of n-alkanes in this mixture. The kerosene like mixture of hydrocarbons is believed to cause a taint in the flesh of the fish. (Katz)

EFFECT OF ENVIRONMENTAL CONDITIONS ON THE DEGRADATION OF DDT IN MODEL MARINE ECOSYSTEMS,
Cornell Univ., Ithaca, N. Y. Lab. of Soil Microbiology.
F. W. Juengst, Jr., and M. Alexander.
Marine Biology, Vol. 33, p. 1-6, 1975, 4 fig., 13 ref.

Descriptors: *DDT, *DDD, *Model studies, *Environmental effects, *Temperature, *Salinity, *Degradation(Decomposition), *Biodegradation, Ecosystems, *Metabolism, *Algae, *Sediments, Sea water, Analytical techniques, Laboratory tests, Gas chromatography.
Identifiers: *Cylindrospermum sp.

Three model ecosystem types were established, one containing seawater, another having seawater plus 3 to 5 grams sediment, and one in which 75 ml of sediment were covered with seawater sufficient to maintain a free water phase of about 5 mm.

U. OF I. URBANA-CHAMPAIGN

Each bottle received 3.75 mg of DDT. No products of DDT metabolism were detected in surface seawater at temperatures of 4 deg. to 32C, at various salinities and in the presence or absence of oxygen. DDD was formed from DDT in surface waters supplemented with Cylindrospermum cells, and both DDD and DDE were produced in surface water -sediment model ecosystems receiving organic amendments. Flooded sediments were especially active in converting DDT to DDD, and an unknown compound accumulated in these sediments. None of a series of compounds known to be generated microbiologically from DDT in vitro was observed in the model ecosystems. (Katz)

A NEW TECHNIQUE FOR REMOTE MONITORING OF ACTIVITY OF FRESHWATER INVERTEBRATES WITH SPECIAL REFERENCE OXYGEN CONSUMPTION BY NIAIDS OF ANAX SP. AND SOMATOCHLORA SP. (ODONATA),
Environmental Protection Agency, Grosse Ile, Mich.
W. R. Swain, R. M. Wilson, R. P. Neri, and G. S. Porter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 503, Price codes: A02 in paper copy, A01 in microfiche. Mimeographed paper, Univ. of Minn. School of Medicine, Duluth, and Lake Superior Basin Studies Center, Duluth, July 1974, 17 p. OWRT B-097-MINN(3).

Descriptors: *Invertebrates, Monitoring, Remote sensing, *Respiration, *Analytical techniques, Dragonflies, Crustaceans, Pollutant identification.
Identifiers: *Oxygen consumption(Niaids), *Anax sp., *Somatochlora sp., Odonata, *Niaids

A new technique is described for remote monitoring of aquatic invertebrate populations which was specifically designed to eliminate effects on organism behavior attendant with other surveillance systems. Specifically, the system described overcomes the necessity for surgical implantation, restrictive weight, and the generation of unnatural activity. This system was used to monitor the activities of a wide variety of aquatic invertebrates ranging in size from crustaceans, 300-600 micro long to dragonfly naiads, 3-5 cm. long. Immature Anax sp. and Somatochlora Sp. were monitored for respiratory activity in relationship to decreasing oxygen tensions. An inverse relationship was observed between respiratory frequency and amplitude of respiration. (Waelti-Minnesota)

EFFECTS ON THE PHOSPHOROUS SITUATION IN LAKE RADASJON ON CHANGES IN THE POLLUTION SITUATION, (IN SWEDISH),
Goteborg Univ. (Sweden). Inst. of Zoology.
L. Henrikson, H. Nyman, and H. Oscarson.
Vatten 31(4), p 398-303, 1975.

Descriptors: *Phosphorus, Lakes, Water pollution effects, Sewage disposal, Waste disposal, Oxygen demand.
Identifiers: *Lake Radasjon(Sweden), Oxygen depletion.

In Lake Radasjon, Sweden (mean depth 8.5 m; area 2.0 km2), the renewal time is 0.2 yr. In July 2972 waste water discharge from 8000-10,000 persons was eliminated from the lake by a waste tube, resulting in a rapid decrease of the total P concentration. The immediate effect of untreated waste water on the total P concentration in the lake was studied twice when the waste tube was damaged. At these times higher values than usual were found in the cove where the waste water was released. The annual total P loading in 1971 was 6.4 g/m2 per yr, in 1973 a.4 g/m2 per yr and in 1975 0.9 g/m2 per yr. This calculated value is probably too high due to deposition of P in lakes upstream of Lake Radasjon. The P loading caused by natural supply exceeds dangerous values. Large parts of the lake bottom occasionally experience O2 deficit and are a potential source of P.A control program to study the total P loading effects in a longer time perspective is being developed.--Copyright 1976, Biological Abstracts, Inc.

THE EFFECT OF CURRENT VELOCITY AND CHANGES IN WATER LEVEL ON THE COMPOSITION OF THE PLANKTONIC CILIATE POPULATION OF THE DANUBE RIVER, (IN HUNGARIAN),
M. C. Bereczyk
Allattani Kozl 62(1-4), p 15-21, 1975.

Descriptors: *Plankton, *Protazoa, *Bacteria, Europe, Velocity, Water levels, Rivers, Water pollution effects.
Identifiers: *Danube River(Hungary), Danubialia, Holotricha, Hungarica, Hungary.

The occurrence of 157 ciliate species in the Hungarian section of the Danube river was studied from 1965-1973. Members of the order Holotricha were dominant in the number of specimens and the number of species. The predaceous and carrion-eating species were dominant earlier, but the bacteria-eating species assumed dominance in the last 3 yr, probably due to pollution. Current velocity below 2 m/s did not inhibit ciliate colonization but flooding did. During floods, the ciliate populations of inlets were only temporarily increased and the number of species and specimens diminshed on the 3rd or 4th day following a flood. The fauna characteristic of the season and the saprobiological condition was evident only when the water level reached 300 cm after a flood.--Copyright 1976, Biological Abstracts, Inc.

Gidrobiol Zh 10(4), p 48-55, 1974.

Descriptors: *Phenols, *Worms, *Toxicity, Water pollution effects, Invertebrates, *Oligochaetes, *Tubificids, Temperature.
Identifiers: Chaetogaster-diaphanus, Euplanaria-lugubris, Glossiphonia-complanta, Haemopsis-congerisuga, Helobdella-stagnalis, Herpobedlla-octoculata, Lumbriculus-variegatus, Mesostoma-ehrenbergii, Stylaris-lacustris, Tubifex-tubifex.

Worms possess a higher resistance to acute phenol intoxication than other water invertebrates, except for Turbellaria (Euplanaria lugubris, Mesostoma ehrenbergii) and small Oligochaeta (Stylaria lacustris, Chaetogater diaphanus, Lumbriculus variegatus, Tubifex tubifex) from the family Naididae. At high temperature and starvation conditions, intoxication in Oligochaeta begins earlier and proceeds more intensely. Resistance of adult and young leeches (Herpobdella octoculata, Haemopsis congerisuga, Glossiphonia complanta, Helobdella stagnalis) is almost the same and considerably exceeds that of eggs.--Copyright 1976, Biological Abstracts, Inc.

STUDIES ON THE TOLERANCE OF THE GUPPY, POECILIA RETICULATA (PETERS), A NATURAL ENEMY OF MOSQUITO LARVAE, TO THE SEPTIC POLLUTION OF WATER, (IN JAPANESE),
Teikyo Univ., Hachioji (Japan). Dept. of Parasitology
T. Kurihara, M. Sasa, J. Miyamoto, and H. Sato.
Jpn J Sanit Zool 24(2), p 165-174, 1973.

Descriptors: *Toxicity, Organic matter, Microorganisms, Aeration, Larvae, *Mosquitoes, Oxidation, Water pollution effects, *Hydrogen sulfide, Ammonium
Identifiers: *Poecila-reticulata.

The toxicity of septic waters (containing organic matter and microorganisms) to P. reticulata was highly correlated with the concentration of H2S concentration increased to>1 ppm, and remained so until the concentration dropped to <2 ppm. The pH level during this period was usually below 6, but it gradually changed to near neutral in connection with the increase of NH3 in the water. The septic water also became non-toxic to the fishes after providing aeration for a few hours. Under experimental conditions, H2S dissolved in distilled water was toxic for the fish at concentrations higher than 1 ppm, while the toxicity of NH3 in water was seen at concentrations > 11 ppm. The toxicity of H2S and NH3 was remarkably reduced by mixing the 2 solution at adequate ratios. (NH4)2S was safe for the fish even at 63 ppm, and became toxic only at 125 ppm and higher. The accumulation of H2S produced by microorganisms under anaerobic condition is probably the principal cause of the toxicity, and the subsequent increase of ammonia in water acts as a neutralizing agent. By providing aeration into the septic waters the DO (dissolved O2) concentration rapidly increased, but in most cases the concentration started to drop after several hours, probably due to reproduction of aerobic microorganisms which consume O2 for oxidizing the fouling substances.--Copyright 1976, Biological Abstracts, Inc.

EFFECT OF MINE WASTEWATERS ON THE WATER QUALITY OF THE OL'KHOVOYE RESERVOIR, (IN RUSSIAN),
I. M. Soboleva, V. L. Sinitsin, A. S. Pel'Tikhin, and A. G. Veselyi.
Gidrobiol Zh 11(4), p 101-104, 1975.

Descriptors: Mine wastes, Mine water, Acid mine water, Bacteria, Reservoirs, Water quality, Water pollution effects, Chlorides, Sulfates, Sodium
Identifiers: *Olkovaye Reservoir(USSR), Titer, Ukrainian-SSR, USSR.

The wastewaters of 42 mines flow into the Ol'khovoye River, on which the Ol'khovoye reservoir is located, in the Donetsk Oblast, Ukrainian SSR (USSR) The chemical composition of the mine waters is characterized by high mineralization and high content of chlorides, sulfates and NA+. To improve the water quality of the reservoir, the mine wastewaters should be treated in settling ponds or at local mine-treatment plants, the tributary channels should be cleaned, water-protection belts and zones should be organized, atierosion measures should be implemented and fresh water should be released from the North

pnets-Donbas canal. Analysis of bacterial terotroph content and coli-titer indicated an insive self-purification process in the reservoir.--pyright 1976, Biological Abstracts, Inc.

nce 1969, wastewaters, surface waters and subrface waters of the temperate climatic zone and e Black and Caspian Seas were examined for the esence of B. bacteriovorus. Presence of thogenic Entero-bacteriaceae, sanitary-indica- microorganisms, enteroviruses and phages of sentery, typhoid and coli bacilli was deterned. The cytopathic effects of 7 strains of B. cteriovorus were studied in monkey kidney and eLa tissue cultures, white mice, rabbits and inea pigs. The strains proved nontoxic and nonulent in LD50 doses to 1 billion. Salmonella phosa and Shigella sonnei isolated from humans d exposed to B. bacteriovorus lost the ability to m colonies on solid media. B. bacteriovorus owed lytic activity with respect to strains of El r vibrios and a pronounced virus-inactivating fect with respect to RNA viruses (enteroviruses) d DNA viruses (adenoviruses). The correlation and between the content of B. bacteriovorus and thogenic microorganisms in fresh and sea ters indicates that it can be used as an indicator water pollution by pathogenic microflora. The npathogenicity of B. bacteriovorus for mamils and the broad spectrum of its lytic activity inate its possible importance in self-purification polluted water, primarily at local treatment nts, particularly for hospital wastewater.--pyright 1976, Biological Abstracts, Inc.

INFLUENCE OF MERCURY, LEAD, CADMIUM AND COPPER ON PRIMARY PRODUCTION AND PHYTOPLANKTON IN SOME COASTAL AREAS OF THE MEDITERRANEAN AND RED SEAS, (IN RUSSIAN),
A. M. Ibragim, and S. A. Patin.
Okeanologiya 15(5), p 886-890, 1975.

Descriptors: *Cadmium, *Copper, *Lead, *Mercury, Light, *Phytoplankton, *Primary productivity, Coasts, Oceans, Temperature, Water pollution effects, Metals.
Identifiers: Coscinodiscus-granii, *Mediterranean Sea, Nitschia-closterium, Rhizosolenia-alata, *Red Sea.

Series of short- and long-term experiments were made to evaluate the effect of Hg, Cu, Cd and Pb upon the production and specific composition of the coastal phytoplankton in the Mediterranean and the Red Seas at in situ temperatures and light conditions (The initial composition of the phytocenosis was mainly Nitschia closterium, Coscinodiscus granii, Rhizosolenia alota.). The experiments showed a possibility of an essential change of photosynthetic rate and specific composition of phytoplankton natural communities under the action of the concentration of metals close to the natural level in the seawater. N. closterium was most stable to the effect of metals.--Copyright 1976, Biological Abstracts, Inc.

SOME ASPECTS OF THE CHEMICAL COMPOSITION OF TRAPA NATANS L. IN LAKE MAGGIORE (ITALY), ESPECIALLY MANGANESE AND IRON, (IN FRENCH),
European Atomic Energy Community, Ispra (Italy).
R. Gommes, and H. Muntau.
Bull Soc R Bot Belg 108(2), p 209-218, 1975.

Descriptors: Lakes, *Manganese, *Iron, Europe, Chemical wastes, Sediments, Leaves, Roots, Water pollution effects.
Identifiers: Albumin, *Italy, *Trapa-natans, Trapa-natans-ssp-verbanensis, *Lake Maggiore(Italy).

T. natans L. ssp. verbanensis (De Not.) Schintz was collected from 1 of its 6 stations in S Lake Maggiore and analyzed for Ca, Mg, Mn, Fe, Na, K and SiO2. This plant is able to accumulate Mn and Fe in its pinnate roots (Mn, 1.36%, Fe, 3.51%). The lowest concentrations were measured in the albumen (Mn, 12 ppm; Fe, 87 ppm). The Fe/Mn ratio progressively decreases from 2.6 in the roots to 0.5 in the leaves where Mn is selectively accumulated. In the water and sediment from Trapa stations, the Fe/Mn ratio was higher than in other stations in Lake Maggiore; the absolute Mn concentrations are only slightly higher than the mean of the lake. Trapa is able to accumulate Mn, but the Trapa-Mn geobotanical association reported in Russian literature is not confirmed. The higher Mn and, especially, Fe concentrations may be due to the decomposing Trapa itself.--Copyright 1976, Biological Abstracts, Inc.

EFFECT OF EXOGENOUS AMINO ACIDS ON PRODUCTIVITY OF CERTAIN HIGHER HYDROPHYTES, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
N. N. Smirnova.
Gidrobiol Zh 11(4), p 47-53, 1975.

Descriptors: *Amino acids, Aquatic plants, Self purification, *Productivity, Organic compounds, Pondweeds.
Identifiers: Exogenous amino acids, Phragmites-communis, Potamogeton-perfoliatus, Spirodela-polyrrhiza.

Experiments performed to elucidate the effect of different concentrations of exogenic amino acids (alanine, glutamic acid and tryptophan) on higher hydrophytes (Phragmites communis Trin.) showed that hydrophyte productivity depends on the chemical nature of the amino acid, its concentration and the biological peculiarities of the plant. Spirodela polyrrihiza and P. communis endured higher concentrations of exogenous amino acids than Potamogeton perfoliatus. This indicates that the 2 former species have a more important role in the self-purification of bodies of water of organic components, including amino acids.--Copyright 1976, Biological Abstracts, Inc.

MAXIMUM ALLOWABLE CONCENTRATION OF LEAD IN SURFACE WATERS, (IN RUSSIAN),
Sverdlovsk Research Inst. of Industrial Hygiene and Occupational Disease (USSR).
M. S. Sadilova, K. P. Selyankina, E. A. Borzunova, and L. N. El'Nichnykh.
Gig Sanit 5, p 101-102, 1975.

Descriptors: *Lead, Surface water, Water supply, Lethal limit, Rodents, Water pollution effects, Water quality standards, Toxicity, Inhibition.

To refine the maximum allowable concentration (MAC) of Pb in water, chronic sanitary-toxicological experiments were performed on albino rats which received daily for 7 mo. an oral Pb dose of 0.005 mg/kg, which corresponded to its MAC in water (0.1 mg/l). This Pb dose led to a statistically significant increase of Pb content in bone, brain and liver. During the prolonged intake of Pb at the MAC for water the functional state of the CNS was disturbed. The blood pyruvic acid concentration increased, which confirmed the inhibiting effect of Pb on the activity of enzymes of carbohydrate metabolism, especially carboxylase. The adopted MAC of Pb in water is possibly too high and should be reduced from 0.1 to 0.05 mg/l.--Copyright 1976, Biological Abstracts, Inc.

THE INFLUENCE OF WASTE WATERS ON ALGAE IN THE OPEN COLLECTOR OF ZAGREB AT IVANJA RIJEKA, (IN CROATIAN),
Zagreb Univ. (Yugoslavia). Institut za Biologijo.
M. Tomec, Z. Pavletic, and I. Munjko.
Acta Botanica Croatica, 34, p 53-62, 1975.

Descriptors: *Algae, Water pollution effects, Aeration, Industrial wastes, Municipal wastes, Organic loading, Activated sludge, *Waste water treatment.
Identifiers: Ivanja, Rijeka, *Zagreb(Yugoslavia), Ivanja Rijeka(Yugoslavia).

The water from the main collector the city of Zagreb, Yugoslavia, is loaded with industrial and municipal wastes. To protect underground and surface waters in that region, these waters should not be allowed to flow into the Sava River without being purified. In addition to the great organic and inorganic load of the collector waters, 70 spp. of algae were found, which probably originated in brook-waters of Zagrebacka gora. A smaller number of algae (5-15) are otherwise relatively frequent in the collector water. The number of algae found in the water after the reception of waste waters was considerably decreased. The microflora in the collector water was very active in the waste organic matter mineralization process, especially in summer, and are used in activated sludge aeration and dephenolization treatment. A reliable test is needed for establishing harmful effects of industrial waste waters on algae and other organisms in receiving waters.--Copyright 1976, Biological Abstracts, Inc.

SURVEYING AMERICA'S LAKES.
Environmental Science and Technology, Vol. 10, No. 9, p 862-864, September, 1976.

Descriptors: *Lakes, *Eutrophication, *Surveys, *Nutrients, *Phosphorus, Surface waters, Minnesota, *United States, Lime, Chemical precipitation, Waste water treatment, Municipal wastes, Treatment facilities, Tertiary treatment, Efficiencies, Evaluation, Algae, Algal control, *Water pollution treatment.

Preliminary results from a eutrophication survey of America's lakes are reported along with an example of how some lakes may be restored to higher quality. According to the National Eutrophication Survey, approximately 80% of the lakes and reservoirs in the eastern United States are eutrophic. Shagawa Lake, adjacent to the city of Ely, Minnesota, is an example of a eutrophic lake that has been partially restored by the removal of the algal growth-promoting nutrient phosphorus. The lake originally became eutrophic as a result of the city of Ely discharging its municipal waste water into it. The installation of a tertiary treatment system at the city's waste water treatment plant resulted in more than 99% removal of phosphorus from the effluent and a decline in eutrophic activity of Shagawa Lake. The effluent flowing into the lake contains only 0.05 milligrams/liter of phosphorus. Although the lake is in the process of repairing itself, it has not yet reached equilibrium, probably because of feedback mechanisms involving internal sources of phosphorus which may be retarding the restoration process. However, the project has demonstrated that phosphorus levels as low as 0.05 milligrams/liter can be achieved through lime precipitation. (Kreager-FIRL)

SOYBEAN YIELD RESPONSES AND ASSIMILATION OF ZN AND CD FROM SEWAGE SLUDGE-AMENDED SOIL.
Illinois Univ. at Urbana-Champaign. Dept. of Agronomy.
T. D. Hinesly, R. L. Jones, J. J. Tyler, and E. L. Ziegler
Journal Water Pollution Control Federation, Vol 48, No. 9, p 2137-2152, September, 1976. 5 fig, 5 tab, 13 ref.

Descriptors: *Sewage sludge, *Soil amendments, *Heavy metals, *Crop response, *Waste disposal, Phytotoxicity, Crops, *Zinc, *Cadmium, Phosphorus, Irrigation, Symbiosis, Sludge disposal, Municipal wastes.

A 6-year study of the effects of irrigating soybean plots with municipal sludge was performed. Applications of digested sludge significantly increased soil levels of zinc and cadium which were reflected by increased concentrations of these metals in plant tissues. However, there were no indications that the absorption and translocation of relatively large amounts of these metals into leaves, petioles, and seeds had caused a phytotoxic condition. Only large amounts of phosphorus as a constituent of sludge caused a yield depression during one growing season, and the phosphorus-induced phytotoxic conditions were rapidly dissipated after sludge applications were suspended. During the following growing season, soybean yields were significantly higher on maximum sludge-treated plots than on fertile control plots. Accumulative applications of sludge affected zinc and cadmium concentrations

n soybean tissues to a lesser extent than did a par-
icular annual application rate. Thus, if phytotoxic
onditions develop as a result of zinc and cadmium
ccumulation in soils amended with sludge over
everal years, they are expected to occur during
he time of sludge application rather than after the
pplications have been terminated as suggested by
ther investigators. (Kreager-FIRL)

hosphorus, Waste disposal, Symbiosis, Liquid
astes, Plant growth.

he effects of repeated tank truck applications of
quid sludge on experimental plots of alfalfa,
orn, and sorghum-sudan were investigated.
udge applications of 5 cm usually provided
elds of corn and sorghum-sudan which were
quivalent to those obtained with a moderately
gh rate of commercial fertilizer when these crops
ere planted in the growing season following
udge application. Sludge applications of up to 15
cm did not reduce crop yields and in fact generally resulted in maximum yields and nitrogen uptake. Substantial residual benefits from sludge were observed at sludge applications as low as 5 cm for sorghum-sudan and 10 cm for corn, whereas no such residual response was observed when commercial fertilizer was applied. Repeated tank truck traffic on established alfalfa plots severely reduced crown survival and subsequent yields, and liquid sludge application by this method is not recommended for such plots. Nitrogen and phosphorus recoveries by corn and sorghum-sudan were relatively low in sludge-treated plots. (Kreager-FIRL)

Identifiers: Atlanta-Gaudichaudi, Creseis-Acicula, Creseis-Chierchiae, Heteropods, Malagasy-Republic, *Nosy-Be, Pneumopdermopsis-Sp, Pteropods.

Pneumopdermopsis sp. a predator of Creseis acicula can only be found very near the coast and shows an annual cycle parrallel to its prey. C. chierchiae shows, on the average, an abundance decrease from the coast to the continental slope, but its annual cycle differs widely from that of C. acicula. The decrease during the dry season, which is less and less marked from the slope toward the bays, reveals only the back flow of the internal neritic water towards the coast at this time of the year. In the bays the abundance reaches its maximum in the dry season. The species is composed of 2 forms which are probably phenotypic: one with a thin ribbed shell, which is strictly internal neritic, and the other with a smooth thick shell which is external neritic. Some specimens which are morphologically intermediate can be found in small quantities when the 2 settlements meet. Atlanta gaudichaudi is found on the whole continental shelf as well as in the waters of the open sea. The young forms appear to be neritic showing an abundance maximum in the set season, when the phytoplankton and the phytophagic zooplankton are abundant. The adults may feed on bigger prey and show less selective distribution.--Copyright 1976, Biological Abstracts, Inc.

DETRITAL UTILIZATION BY THE POLYCHAETE, CAPITELLA CAPITATA,
Woods Hole Oceanographic Institution, Mass. Dept. of Biology.
K. R. Tenore.
Journal of Marine Research, Vol. 33, No. 3, p. 261-274, 1975. 4 fig., 4 tab., 39 ref. NSF GA-39911.

Descriptors: *Annelids, *Detritus, *Decomposing organic matter, *Food chains, Radioisotopes, Tracers, Particle size, Coasts, Estuaries, Marine animals, Energy budget, Laboratory tests.
Identifiers: *Polychaetes, *Capitella capitata, Eel grass, Zostera marina, Carbon-14.

Little quantitative data is available on rates of utilization of organic detritus, an important energy source in marine ecosystems, by deposit feeders, in part because of the difficulty of using isotope tracer techniques due to the release and recycling of such labels as carbon-14. This study investigated the effect of initial particle size and aging of detrital eel grass on net incorporation by the polychaete, Capitella capitata, using controls to account for isotope tracer errors due to leaching of carbon-14. Results showed an increase in the rate of incorporation with increasing detritus age for all particle sizes. For the first two periods of aging (0 and 11 days) there was a greater incorporation of the finest size detritus while the later periods revealed a greater incorporation of larger size detritus. Decay experiments with detritus showed an initial rapid decrease then a slower rate of increase in nitrogen content and corresponding changes in C:N ratios. Observed differences illustrate the need for considering the qualitative state of detritus used in growth experiments. In addition, the long decay time associated with seagrasses versus shorter decay periods of detritus from other sources would prolong the availability of the detrital food resource by expanding the temporal period of utilization of the total detrital pool. ALGAL METABOLITE INFLUENCE ON BLOOM SEQUENCE IN EUTROPHIED FRESHWATER PONDS,
Haskins Labs., Inc., New Haven, Conn. Orsborn Memorial Lab.
K. I. Keating.
Report No. EPA-600/3-76-081, July 1976. 155 p. 26 fig., 14 tab., 144 ref. RA 801387.

Descriptors: *Inhibition, *Cyanophyta, *Diatoms, *Plant growth regulators, *Plant growth substances, *Algal control, *Succession, Zooplankton, *Connecticut, *Eutrophication, Silica, Water pollution effects.
Identifiers: Linsley Pond(Conn).

Biological sequence control of algal blooms is suggested as a relatively-inexpensive method of water quality management in moderately-sized eutrophic lakes as a practical alternative and/or adjunct to nutrient removal. Monitoring of bloom sequence in Linsley Pond, Connecticut for three years, accompanied by laboratory studies showed that certain extracellular metabolites in blue-green algae substantially inhibit the growth of planktonic diatoms in cultures and in the pond's natural sequence. A hypothetical sequence control strategy is offered, with a projected cost of about $500 per year for a pond similar to the study site. Using the strategy, winter blue-green blooms would be eliminated by copper sulfate and spring diatom growth enhanced by the addition of silica. The silica would enhance the diatom growth and some other desirable forms and would lessen the effect of the remaining blue-green metabolite inhibition. Such efforts should then increase the period of diatom domination, decrease nutrient levels left in the epilimnion when the diatoms senesce, and decrease the subsequent late summer blue-green bloom. Details are given of the in situ and of the laboratory tests. (Harris-Wisconsin)

Descriptors: *Ozone, *Vascular tissues, Oxidation, Oxygen, Plant morphology, Xylem, Plant physiology, Phloem, Cellulose, Lignins, Enzymes, Proteins, Plant growth regulators.
Identifiers: *Xylem regeneration, *Indoleacetic acid, *Dichlorophenoxyacetic acid, Callus tissues, Plant internodes, Coleus blumei(Benth).

Vascular tissues of Coleus blumei (Benth) show alterations in both quantity and quality upon exposure to ozone, the heavy oxygen that is a common constituent of airborne pollution. Laboratory tests of xylem regeneration around wounded plant internodes showed that ozone-induced xylogenesis is reduced more in internodes grown in indoleacetic acid (IAA) than in dichlorophenoxyacetic acid. As a corollary, the substitution of the latter for IAA in media where sucrose also is present has a mitigating effect on the action of ozone in the xylem regeneration process. Preliminary findings also suggest that ozone has an influence on the protein and enzyme patterns in callus tissues exposed to the pollutant. The results support a supposition that plant internodes and callus tissues can both be used to study ozone effects on certain plant growth and development processes, including: (1) phloem differentiation; (2) cellulose and lignin production; (3) plant membrane integrity; (4) quantity and quality of proteins and enzymes in growing and differentiating plant tissues, and (5) the effectiveness of growth regulators in the presence of ozone. PHOSPHATE REDUCTION AND RESPONSE OF PLANKTON POPULATIONS IN KOOTENAY LAKE,
Washington State Univ., Pullman.
R. A. Parker.
Report No. EPA-600/3-76-063, May 1976. 70 p. 29 fig., 5 tab., 40 ref., append. R-800430.

Descriptors: *Nutrient removal, *Phosphates, *Lakes, *Biological communities, Zooplankton, Phytoplankton, *Canada, Dams, Nitrogen, Diatoms, Daphnia, Cyanophyta, Simulation analysis, Columbia River, Hydrodynamics, Water temperature, Secchi disks, *Montana.
Identifiers: *Phosphate load reduction, *Lake Kootenay(British Columbia), Kootenay River(British Columbia), Libby Dam(Mont).

Although only a 10-15% decrease in chlorophyll-a levels were found in Kootenay Lake, British Columbia, after the soluble inorganic phosphate entering the lake was reduced 90%, important changes were recorded in the species composition of the phytoplankton population, with diatoms playing an increasingly important role relative to blue green algae. However, these changes may have been partially affected also by the completion in 1972 of the Libby Dam in Montana, upstream from the lake on the Columbia River system. Kootenay, a large and oligotrophic lake, received significant quantities of inorganic phosphate by way of the Kootenay River for 13 years prior to 1969. Post-phosphate reduction measurements were made in 1971-75, analyzing temperature, transparency, inorganic and organic phosphate, nitrate, ammonium, chlorophyll-a, copepods and cladocerans. The measurements were compared with results from limnological studies that were made of Kootenay before 1969, which emphasized nutrient levels, plankton densities, phytoplankton composition and associated parameters. Other results show that one genus of zooplankton, Daphnia, has virtually disappeared although total zooplankton levels have not changed. Primary production changed from nitrogen-limited in 1969 to phosphate-limited in 1971. A model was developed from the 1966-69 data when the phosphate input was high to predict the consequences of reduced phosphate input. (Harris-Wisconsin)

MATHEMATICAL MODELING OF PHYTOPLANKTON IN LAKE ONTARIO. PART 2. SIMULATIONS USING LAKE 1 MODEL,
Manhattan Coll., Bronx, N. Y. Environmental Engineering and Science Program.
R. V. Thomann, R. P. Winfield, D. M. Di Toro, and D. J. O'Connor.
Report No. EPA-600/3-76-065, August 1976. 96 p. 17 fig., 11 tab., 15 ref. R-800610

Descriptors: *Simulation analysis, *Lake Ontario, *Phytoplankton, *Nutrients, Model studies, Mathematical studies, Mathematical models, Biomass, Productivity, Chlorophyll, Phosphorus, Nitrogen, Optimization, Probability, Great Lakes.
Identifiers: US-Canada Water Quality Agreement.

Simulations of the response of the open lake region of Lake Ontario to various levels of nutrient input, using a model developed in an earlier part of the study, tend to indicate that maximum point-source nutrient control for that part of the lake will be only a holding action and not a significant improvement in water quality parameters, because of projected difficulties in achieving measurable reductions below present levels of phytoplankton biomass beyond the near-shore zone. Simulations used a simplified dynamic model of phytoplankton-nutrient interactions in a vertically-segmented structure and assumed a horizontally well-mixed lake. Simulations assumed four different load conditions of phosphorus input as against two assumed loadings of nitrogen input. Results indicate that if the present input nutrient load is continued, spring peak phytoplankton chlorophyll level in the epilimnion will continue to increase to a new level about 45% higher than the present one. By comparison, a retrospective simulation with pastoral load estimates shows that spring phytoplankton levels were some 40% less than at present, prior to the onset of man's intensive activity level around the lake. BIOLOGY OF BLUE-GREEN ALGAE OF TIDE MARSHES,
Delaware Univ., Lewes. Coll. of Marine Studies.
G. F. Somers.
Available from the National Technical Information Service, Springfield, VA 22161 as COM-75-11091, Price codes: A04 in paper copy, A01 in microfiche. Report No. DEL-SG-14-75, 1975. 64 p. 8 fig., 16 tab., 37 ref. OSG 2-35223.

Descriptors: *Tidal marshes, *Cyanophyta, Calcium, Brackish water, Plant ecology, *Delaware, Estuarine environment, Ions, Water pollution effects, Eutrophication.
Identifiers: *Calcium ion binding, Calcium cycling, St. Jones Marsh(Del), Canary Creek Marsh(Del), Cape Henlopen(Del), Big Nose Island(Del).

Dead cells of blue-green algae from laboratory cultures as well as those harvested from a tidal marsh, have a substantial capacity to bind calcium ions--a capacity in algae from a natural habitat exceeding that of the cell walls of rhizomes of Spartina alterniflora with which it might be in competition. At least in brackish waters these algae cells retain a substantial portion of the calcium ions and this is readily exchanged with the ambient medi um. Algal cells could then contribute to calcium cycling by exchange reactions, with moribund o dead cells serving as a temporary reservoir of thi cation. No quantitative measurement was made o this potential, but a qualitative assessment base on visual estimation of mass and seasona abundance suggests that the blue-green algae ma well contribute to the calcium cycling of a tide marsh by uptake during periods of rapid growt and of release during their demise. Total mass o the algae may be insufficient, however, to con tribute substantially to the calcium needs of th marsh environment. There is a possibility that similar role in calcium ion binding may be playe by other algae that are abundant during th seasons when blue-green algae are not con spicuous. (Harris-Wisconsin)

ANALYSIS OF POLLUTION FROM MARINI ENGINES AND EFFECTS ON THE ENVIRON MENT. SUMMARY REPORT.
Boating Industry Associations, Chicago, Ill.
Available from the National Technical Informa tion Service, Springfield, VA 22161 as PB-242 177 Price codes: A04 in paper copy, A01 in microfiche Report No. EPA-670/2-75-064, June 1975. 69 p. fig., 10 tab., 15 ref. 1BB038, R-801799.

Descriptors: *Water pollution effects, *Boats Biota, Fish, Oil pollution, Carbon dioxide, Car bon, Aquatic plants, Photosynthesis, Lead, Fuels Gasoline, Aromatic compounds, Michigan Florida.
Identifiers: *Outboard motor emissions, Carbo monoxide, Hydrocarbon, Ann Arbor(Mich) Gainesville(Fla).

Outboard motor emissions were not found to sig nificantly affect aquatic ecosystems, in a study i which four ponds were subjected to use by out board marine engines calculated to be three time greater than the level extant with saturation boat ing. Certain marginal changes in lake biota wer found but it was not certain whether these resulte from natural effects or from the stress created b the engines. In a laboratory phase of the stud conducted by the departments of Civil an Mechanical Engineering of the University c Michigan, carbon monoxide at near-saturatio levels did not kill fish. Aromatic compounds suc as toluene have an evaporation half-life of 11 day in a lake or other water body, assuming quiescenc and uniform distribution to an initial depth of on meter. However, there is uncertainty concernin the build-up of lead in bottom sediments as a resul of outboard engine operation using leaded fuel an the effect of carbon dioxide in carbon-limite lakes. Phytoplankton carbon fixation appeared t be reduced and differences were noted in th production of biomass and chlorophyll-a. (Harris Wisconsin)

NUTRITIONAL ECOLOGY OF NUISANC AQUATIC PLANTS,
Wisconsin Univ., Madison. Dept. of Botany.
G. C. Gerloff.
Available from the National Technical Informa tion Service, Springfield, Va 22161 as PB-244 263 Price codes: A05 in paper copy, A01 in microfiche Report No. EPA-660/3-75-027, June 1975. 86 p. 1 fig., 24 tab., 38 ref. 21AJF 005, R-800504

Descriptors: *Analytical techniques, *Bioassay *Nutrients, *Nutrient requirements, *Aquatic plants, *Aquatic algae, Anabaena, Competition Absorption, Plant growth, Nitrogen, Phosphorus Potassium, Copper, Testing procedures, Trace elements, Limiting factors, Wisconsin
Identifiers: Plant analysis, Myriophyllum spicatum, Ceratophyllum demersum, Elodea oc cidentalis, Draparnaldia plumosa, Lemna minor Stigeoclonium tenue, Microcystis aeruginosa

A method for determining the trophic level and growth-limiting nutrients of waters by plant analysis is proposed. The detailed technique indicated that potassium, rather than nitrogen or phosphorus, becomes the limiting factor for the growth of the macrophytes Myriophyllum spicatum and Ceratophyllum demersum in a shallow eutrophic Wisconsin lake. Plant analysis data also indicate that critical concentrations of an element--the minimum or slightly less than the minimum concentration which will permit maximum plant yield and growth--can vary considerably among different organisms, to the extent that similar critical values cannot be generally applied even within a single taxonomic group. A technique developed for comparing aggressiveness and competitiveness among organisms in nutrient uptake is suggested for further testing, particularly among major nuisance plants. More tests are also suggested for measuring the possibility that inorganic nutrients other than nitrogen and phosphorus can be critical in nuisance plant growth. Suggested procedures are: (1) Measuring competition among several organisms in the culture for a growth-limiting amount of a specific nutrient; (2) measuring nutrient replacement in cultures to establish the border-line concentration at which an organism failed to achieve maximum growth regardless of the adequacy of the nutrient supply; and (3) measurement of rates of nutrient uptake. (Harris-Wisconsin)

SOME EFFECTS OF THE ASWAN HIGH DAM ON WATER AND FISHES OF LAKE BORULLUS, A. R. E.,
Academy of Scientific Research and Technology, Cairo (Egypt).
H. M. El-Sedfy, and J. Libosvarsky.
Zool Listy. 23(1), p 61-70, 1974.

Descriptors: *Lakes, Africa, *Nutrients, Fish, Fish reproduction, Fishing, Tilapia, Water pollution effects, *Water quality.
Identifiers: *Aswan Dam(Egypt), *Lake Borullus(Egypt).

The scanty data assembled on the inflow of fresh water into Lake Borullus throw some light on the developments occurring in the Nile delta lakes after the new High Dam at Asswan was erected. In contrast to the past when huge amounts of flood water poured into the lake during 2-5 months of the year, the lake now obtains drainage and, to some extent, also Nile water more or less regularly throughout the year. As a result the water level as well as the water chlorinity are more balanced, which, presumably together with the lower input of fish and nutrients of Nile origin, have a bearing on the fish fauna and fish production in the lake. The landing statistics for 9 yr (1962-1970) show, commencing form the peak year 1966, a gradual decrease in fish production and a shift in favor of Tilapia species. The overfishing the lake has been exposed to may play an important role in this respect.--Copyright 1975, Biological Abstracts, Inc.

WATER FOWL REFUGE EFFECT ON WATER QUALITY: I. BACTERIAL POPULATIONS,
New Mexico Inst. of Mining and Technology, Socorro. Dept. of Biology; and New Mexico Inst. of Mining and Technology, Socorro. Dept. of Chemistry.
A. A. Brierley, D. K. Brandvold, and C. J. Popp.
Journal Water Pollution Control Federation Vol. 47, No. 7, p 1892-1900, July 1975. 4 fig, 4 tab, 9 ref. OWRT A-038-NMEX(4).

Descriptors: *Waterfowl, Aquatic bacteria, Sediment load, Water quality, Water pollution sources, Bacteria, *Rio Grande River, Nutrients, Migrating birds, Aquatic life, Canada goose, Snow goose, Ducks(Wild), Sandhill cranes, Coliforms, New Mexico, Running water.
Identifiers: Bosque del Apache National Wildlife Refuge(N Mex), Enterococci, Heterotrophic bacteria.

The Bosque del Apache National Wildlife Refuge is located on the Rio Grande about 12 miles (19.32 km) south of Socorro, New Mexico. The largest bird populations occur from late October to early March; average figures are 10,500 sandhill cranes, 2,000 canada geese, 8,300 snow geese and 26,500 ducks. The channel water of the Rio Grande which flows through the refuge has a high concentration of suspended sediment, heterotrophic bacteria, and coliforms. The bacterial concentration seems to correlate directly with the high sediment concentrations. The presence of a large number of birds apparently did not affect the concentrations of total heterotrophic bacteria, coliform counted at incubation temperatures of 35 and 44.5C, and enterococci. The draining of the principal pond did not seem to affect significantly the bacterial population in the recieving channel water. The pond had a decrease in number of bacteria during and following its period of maximum use. There was little apparent change in the quality of the water used by the refuge as evaluated by quantitative determination of heterotrophic bacteria, coliforms, and enterococci. (Hain-New Mexico State)

SEASONAL VARIATIONS OF TEMPERATURE AND NUTRIENTS IN THE SURFACE WATERS OF LAKES ONTARIO AND ERIE,
Eidgenoessische Anstalt fuer Wasservorsorgung, Abwasserreinigung und Gewaesserschutz, Kastienbaum (Switerzerland). Hydrobiology Lab.
R. Gachter, R. A. Vollenweider, and W. A. Glooschenko.
J Fish Res Board Can. 31(3), p 275-290, 1974.

Descriptors: Seasonal, *Lake Ontario, *Lake Erie, *Water temperature, *Nutrients, Surface waters, Great Lakes, Canada, Primary productivity.

During 1970, temperature and nutrient distributions were measured in surface waters of lakes Ontario (12 cruises) and Erie (10 cruises) (USA, Canada). Nutrient patterns are compared and discussed in relation to temperature, primary production and nutrient sources. In Lake Erie, due to the early onset of the phytoplankton spring bloom, nutrient concentration started to decrease much earlier than in Lake Ontario. During spring, patterns of nutrients, chlorophyll a and primary production were influenced by the thermal bar in Lake Ontario. In Lake Erie the nutrient supply controlled such patterns. In Lake Erie inorganic nutrients were depleted lake-wide in summer; in Lake Ontario, nutrients were highest in regions where upwelling occurred or inputs were high. Due to the earlier onset of fall overturn in Lake Erie, the nutrient concentration started to increase earlier in the fall than in Lake Ontario.--Copyright 1974, Biological Abstracts, Inc.

THE EUTROPHICATION IMPLICATIONS OF INTERACTIONS BETWEEN NATURALLY OCCURRING PARTICULATES AND METHANE OXIDIZING BACTERIA,
Ohio State Univ., Columbus. Dept. of Microbiology.
T. L. Weaver, and P. R. Dugan.
Water Research, Vol. 6, p. 817-828, 1972. 10 fig, 1 tab, 8 ref. OWRT A-027-OHIO(4).

Descriptors: *Eutrophication, *Methane bacteria, Clay minerals, Oxidation, Aquatic microbiology, Algae, Chromatography, Pollutant identification, Cycling nutrients, Lake Erie, Ecosystems.
Identifiers: *Methane oxidation, *Methane fixation, Methane carbon recycling.

The oxidation of methane by bacteria is shown to be markedly affected by various particulate materials. Several clay minerals enhanced methane oxidation while some non-clay inorganic particulates nearly completely inhibited it. Insoluble organic compounds tested were degraded in the cultures and did not function as particles. Algal cells observed as living organic particulates inhibited methane oxidation with various degrees of intensity. Suggestions are given for several particulate management practices to partially control eutrophication. (Chao-Ohio St)

THE EFFECT OF SELENITE ON THE PHYSIOLOGICAL AND MORPHOLOGICAL PROPERTIES OF THE BLUE-GREEN ALGA PHORMIDIUM LURIDUM VAR. OLIVACEA,
Medical Coll. of Ohio at Toledo. Dept. of Microbiology.
M. Sielicki, and J. C. Burnham.
Journal of Phycology, Vol. 9, No. 4, p 509-514, 1973. 6 fig, 16 ref. OWRT A-025-OHIO(3).

Descriptors: *Cyanophyta, Algae, Algal control, Chlorphyll, Photosynthesis, Systematics, Proteins.
Identifiers: *Selenite, *Phormidium luridum, Sodium selenite.

Phormidium luridum cultures were treated with sodium selenite in concentrations ranging from 10-6M to 10-2M. In contrast to the increasing culture turbidity of control and 10-6M selenite cultures, the turbidity of the other selenite cultures declined in proportion to time and selenite concentration. Chlorophyll extraction revealed similar results. Photosynthetic activity was inhibited within 6 hr in all cultures except control and 10-6M selenite. Phormidium at concentrations greater than 10-6M selenite showed a gradual loss of the bright green color and turned semitransparent. Cell-associated granules of reduced selenium were observed at higher selenite concentrations. Other structural changes observed were the presence of intracellular and intercellular spaces, spheroplast formation, and gradual cell lysis. Protein analyses of total cell samples and supernatant fractions confirmed cellular breakdown of selenite-treated algal cells.

SURVEY OF MACROINVERTEBRATE COMMUNITIES IN THE PROVO RIVER AND DIAMOND FORK SYSTEMS,
Brigham Young Univ., Provo, Utah. Center for Health and Environmental Studies.
R. N. Winget, and M. K. Reichert.
Final report, 36 p., 4 fig, 11 tab.

Descriptors: *Benthos, Stream improvement, *Water quality, Habitats, Surveys, *Utah, *Invertebrates, Pre-impoundment.
Identifiers: Provo River(Utah), Diamond Fork River(Utah), Central Utah Project, Critical aquatic habitat.

Several proposed features of the Bonneville Unit of the Central Utah Project (cup) would have significant impacts on the aquatic resources of the Provo River and Diamond Fork Systems. In order to prepare an adequate environmental impact statement an understanding of existing conditions was needed. This study was to provide characteristics of the macroinvertebrate communities of the major segments of the streams in these two systems. These data are to provide a partial basis of habitat evaluations and future management alternatives in relation to water resource development under the CUP. Both systems had segments capable of supporting quality cold water fisheries; segments of marginal quality requiring improved management practices before a fisheries could be sustained; and segments which should be designated as primarily water transport systems and not listed as part of the fisheries habitat

UNIV. OF ILL. URBANA-CHAMPAIGN

resource for this area. The macroinvertebrate communities reflected the environmental characteristics of each of these segment types.

TOXICITY, UPTAKE AND SURVEY STUDIES OF BORON IN THE MARINE ENVIRONMENT,
Fisheries and Marine Service, West Vancouver (British Columbia). Pacific Environment Inst.
J. A. J. Thompson, J. C. Davis, and R. E. Drew.
Water Research, Vol. 10, No. 10, p 869-875, 1976.

Descriptors: *Pulp wastes, *Water pollution effects, *Toxicity, *Boron, *Marine animals, Aquatic animals, Sodium compounds, Salmon, Lethal limit, Sockeye salmon, Oysters, Canada, Foreign countries, Wastes, Industrial wastes, Water pollution sources, Freshwater, Sea water, Bioassay, Effluents, Pacific Coast Region, Fish physiology, Fish behavior, Fish, Pulp and paper industry.
Identifiers: Sodium metaborate, Coho salmon(Onchorhynchus kisutch), Crassostrea gigas, Groundwood mills, Boron compounds, Borates.

Little is known about the toxic and bioaccumulative dangers to aquatic life posed by borate discharge recently initiated by coastal British Columbia groundwood pulp mills. Bioassays with sodium metaborate and underyearling coho salmon (Onchorhynchus kisutch) in fresh water yielded a 283-hr LC(50) of 113 micrograms/ml (95% confidence limits of 104 and 123 micrograms/ml boron). Toxicity to coho salmon in sea water appeared considerably greater with a 283-hr LC(50) of 12.2 micrograms/ml (95% confidence limits of 10.89 and 14.56 micrograms/ml boron). The disparity between fresh and saltwater boron toxicity to coho is not understood. In salmonids, boron enters the tissues slowly, necessitating prolonged bioassay tests. Sockeye salmon (O. nerka) and juvenile oysters (Crassostrea gigas) exposed to sublethal doses of boron take up boron roughly in relation to its availability. Oysters show no bioaccumulative potential or prolonged retention of boron following cessation of dosage. Field surveys conducted before and after industrial borate emission confirm the lack of evidence for tissue bioaccumulation. Results of a survey of boron levels in receiving waters are reported. No hazard to salmonids or oysters at the present level of industrial discharge of boron (less than 1 microgram boron/ml) is apparent from this work. (Witt-IPC)

PROGRESS IN SUBLETHAL EFFECT STUDIES WITH KRAFT PULP MILL EFFLUENT AND SALMONIDS,
Fisheries and Marine Service, West Vancouver (British Columbia). Pacific Environment Inst.
J. C. Davis.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 9, p 2031-2035, September, 1976. 33 ref, 2 tab.

Descriptors: *Pulp wastes, *Water pollution effects, *Salmonids, Bleaching wastes, Wastes, Industrial wastes, Water pollution sources, Water pollution, Fish, Growth rates, Fish behavior, Metabolism, Respiration, Circulation, Temperature, Resistance, Energy, *Lethal limit, Fish physiology, Toxicity, Effluents, Pulp and paper industry, Taste, Color, Organoleptic properties.
Identifiers: Kraft mills, *Sublethal effects.

Literature values of incipient sublethal response threshold concentrations for salmonids to effluent from neutralized whole bleached kraft mills, kraft bleaching, and the production of unbleached pulp are summarized. Sublethal responses included effects on growth, behavior, energetics, metabolism, respiration, circulation, and temperature tolerance in a variety of salmonids. The average incipient threshold concentration for all species surveyed was 0.16 of the 96-hr LC(50) and ranged from 0.006 to 0.33 96-hr LC(50) for neutralized whole bleached kraft mill effluent. Large differences in sensitivity were not evident between salmonid species or the three effluent types surveyed. On the basis of this analysis, it is suggested that some sublethal effects for neutralized whole bleached kraft mill effluent wil be present at a discharge dilution of 0.1 96-hr LC(50), few at 0.05 96-hr LC(50), and only rarely at 0.02 96-hr LC(50). However, at a dilution of 0.02 of the 96-hr LC(50), flesh tainting or color effects on the food chain may remain. These criteria are considered tentative and subject to revision with new knowledge and do not necessarily ensure protection of aquatic communities or sensitive food-chain organisms. Future research needs and suggestions for criteria implementation are discussed. (Witt-IPC)

5D. Waste Treatment Processes

A BIOASSAY TO ASSESS WASTEWATER TOXICITY TO AEROBIC BIOLOGICAL TREATMENT,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
K. J. Williamson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 394, Price codes: A03 in paper copy, A01 in microfiche. Oregon Water Resources Research Institute, Corvallis, Completion Report WRRI-49, September 1976. 43 p, 8 fig, 2 tab, 33 ref. OWRT A-036-ORE(1).

Descriptors: *Toxicity, *Bioassay, *Biological treatment, *Waste water treatment, *Aerobic treatment, Zinc, Phenols, Freeze drying, Activated sludge, Nitrites, Bioindicators, Pollutant identification, Heavy metals.
Identifiers: Nitrobacter, Trichlorophenol.

The objective was to develop a bioassay for wastewater toxicity that could be used at sewage treatment plants. Nitrobacter was used as the test organism due to the simplicity of quantifying substrate removal rates by measuring nitrite removal, a sensitivity for most toxicants greater than that of heterotrophic organisms, and a slow growth rate which enables the use of batch-fed tests. A method was developed for preserving the Nitrobacter organisms by freeze-drying. Substrate removal rates were measured for both freeze-dried and non-freeze-dried Nitrobacter in the presence of a heavy metal and an orgaic toxicant. Zinc and 2,4,5-trichlorophenol exhibited toxic effects to the Nitrobacter at concentrations comparable to those toxic to activated sludge.
W77-02081

A STUDY OF THE PHYSICOCHEMICAL PARAMETERS AFFECTING THE REMOVAL OF COLLOIDAL PARTICLES FROM WATER BY POROUS MEDIA,
Maine Univ., Orono. Dept. of Civil Engineering.
M. M. Ghosh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 392, Price codes: A03 in paper copy, A01 in microfiche. Maine Land and Water Resources Institute, Orono, Completion Report, April 1976. 34 p, 5 fig, 4 tab, 14 ref. OWRT A-023-ME(2).

Descriptors: *Filtration, Polymers, *Zeta potential, *Diffusion, Effluents, *Colloids, *Waste water treatment, *Porous media, Model studies, Dispersion, Sewage effluents, Interception, Sands.
Identifiers: *Colloid Filtration, Polymer-coated sands, Brownian diffusion, London forces.

A conceptual model has been developed for the depth filtration of water and wastewater using granular beds considering the effect of gravity, interception, hydrodynamic forces, London attraction and Brownian diffusion for systems with negligible double layer forces. The ultimate capture of particles in a packed bed is determined not only by the transport mechanisms but also by the short-range surface forces which may play a dominant role in their attachment to media grains. The experimental data obtained for the filtration of latex monodispersions and secondary effluents using a polymercoated sand bed were in good agreement with the predictive model during initial periods of filtration when the volume of deposited material was insignificant.

During 1973 through 1974, the city of Tucson, Arizona, reported discharges of wastewater daily These wastewaters contain large quantities of essential plant nutrients, particularly nitrogen, phosphorus, and potassium. Research was conducted to evaluate wastewater as a source of plant nutrients and its effect upon the plants. A second objective was to evaluate the effect of wastewater application on soil chemical characteristics. Wheat plants were grown on three textures of native Gila series soils using several wastewater, wastewater-well water, and fertilizer treatments. Various physical and chemical plant parameters were measured The results were inconclusive in providing a true measure of increased yield or chemical composition of wheat straw due to wastewater applications Chemical analysis of the soils, after two consecutive crops of wheat grown to maturity in

each treatment, revealed several good indicators of wastewateroinduced chemical changes. Electrical conductivity and sodium phosphorus content of the soils were shown to be good measures of soil chemical changes resulting from wastewater applications. (Jamail-Arizona)

Descriptors: *Chlorine, *Halogens, *Bromine, *Iodine, *Hydrolysis, Chlorination, Chemical reactions, Water purification, Water treatment, *Disinfection, Water quality, Chemistry, Chemical degradation, Mathematical studies, Equilibrium, Aqueous solutions, Equations, *Waste water treatment, Computer programs, Pollutant identification.
Identifiers: *Chlorine hydrolysis, *Bromine hydrolysis, *Iodine hydrolysis, *Halogen species, Aqueous halogen equilibria, Equilibrium constants, Chlorine solutions, Disinfectants.

A 'master equation' was derived for the exact determination of the concentrations of halogen species formed when elemental chlorine, bromine, or iodine have been added to a water containing no interacting substances. The solutions to this equation apply only to equilibrium conditions and are only as exact as the equilibrium constants used in the calculations. Simplified lower order equations were also derived for such determinations where known boundary conditions exist. Logic diagrams were presented for the solution of the 'master equation' with the aid of a computer or a programmable calculator. A program was presented for solving the 'master equation' on the Hewlett-Packard 9830A Calculator. (Henley-ISWS)

WATER SUPPLY AND SEWAGE TREATMENT IN ARID AREAS.
Water Services, Vol. 80, No. 960, p 79-80, February, 1976.

Descriptors: *Water supply, *Sewage treatment, *Arid lands, *Sewage disposal, Potable water, Environmental effects, Sewage, *Treatment facilities, Waste water(Pollution), Water pollution, Water pollution sources, Water quality, Deserts, Desalination, Water treatment, Sludge disposal, Water reuse, Impaired water use, Waste water disposal, Solar.
Identifiers: Distillation.

Water supply and sewage treatment facilities in arid areas such as the Middle East, where potable water is scarce, present a variety of problems. Water demand, water supply and water quality in the Middle East are discussed and evaluated, and sewage treatment and its water requirements are investigated. Various methods of water resource development are presented including the drilling of deep bore holes to provide access to underground waters and the collecting of water in shallow concrete pans. Saline wells and seawater represent other possible water sources, and methods for their treatment such as desalination and solar distillation are evaluated. Sewage disposal and water reuse for agriculture are also discussed. It is concluded that there is need for education concerning public health, especially in areas where good water systems are a recent innovation. (Jamail-Arizona)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 347, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, August 1976. 30 p, 14 fig, 5 tab, 2 ref. OWRT A-074-MO(1). 14-31-0001-5025 and 6026.

Descriptors: Biological treatment, Dewatering, Sludge digestion, *Aerobic digestion, *Design criteria, *Sewage sludge, *Sludge treatment, Lime, *Waste water treatment, Water pollution control, Operations, Performance.
Identifiers: *Sewage lime sludge.

The purpose was to develop a set of criteria applicable for the design and operation of an aerobic digester treating sewage lime sludge generated from advanced waste treatment plants. Major parameters included: (1) detention time; (2) degree of sludge stabilization in terms of volatile solid destruction and COD reduction; (3) sludge dewaterability; (4) fate of precipitated phosphorus; (5) destruction of coliforms; and (6) effect of temperature on the sludge stabilization. Data of this study have indicated that sewage lime sludge is treatable by biological means. A maximum extent of stabilization is achieved within 5 days of digestion, as opposed to 15 days normally used for regular aerobic digesters. Improvement of sludge dewaterability has been significant, with similar efficiencies for a detention time ranging from 1.5 to 10 days; beyond that, a slight decrease of dewaterability has occured. Destruction of coliforms is not good even with a detention time as long as 20 days. Maintenance of a proper DO level in the digester is essential to prevent the release of phosphorus from the sludge phase into the aqueous solution. The treatment efficiencies at 20 and 30C are not much different while that at 10C is considerably lower. Based on the above findings, a new set of design criteria has been proposed for handling the sewage lime sludge.

REMOVAL OF VIRUSES FROM WATER BY MAGNETIC FILTRATION,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
G. Bitton, G. E. Gifford, and O. C. Pancorbo.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-261 494, Price codes; A05 in paper copy, A01 in microfiche. Florida Water Resources Research Center, Gainesville, Publication No. 40, October 1976. 75 p, 9 fig, 21 tab, 84 ref, append. OWRT A-030-FLA(3), 14-31-0001-5009, 14-34-0001-6010.

Descriptors: *Filtration, *Waste water treatment, *Viruses, *Bacteriophage, Separation techniques, *Adsorption, Water treatment.
Identifiers: *Virus removal, *Magnetic filtration, *Poliovirus.

The process of magnetic filtration was applied to the removal of T2 bacteriophage, MS2 bacteriophage, and poliovirus type 1 (Sabin) from water and wastewater. Since the effectiveness of this process is governed by the adsorption of the viruses onto the magnetic iron oxide seed, magnetite, those factors influencing adsorption were investigated. The adsorption of the three viruses studied to magnetite at a concentration of 500 ppm increased in the presence of cations, was not affected when the pH was varied from 5 to 9, and could be described by the Freundlich adsorption isotherm. Viruses were suspended in two wastewater effluents and subsequently removed by magnetic filtration. Organic color interfered with the adsorption process. The interference was reduced by the addition of CaCl2, by the dilution of the wastewater with distilled water or by removing the organic color with activated carbon. Competition for adsorption was also exerted by 100 ppm of egg albumin, casein and dextran resulting in a significant reduction in the removal of poliovirus. Additionally, the infectivity of the magnetite-bound viruses was studied. Poliovirus, adsorbed to magnetite, was 100% infective whereas T2 phage displayed a lower and somewhat variable infectivity.

U. OF I. URBANA-CHAMPAIGN

An 11-mile, $20 million continuous sewer tunnel which extends across the city of Austin, Texas is described. The sewer tunnel is designed to serve as a sanitary sewer and obviates about 98,000 ft of relief sewer construction work. Anticipating a maximum flow rate of 131 million gallons/day for the year 2020 and an allowable slope of about 0.00066, the lower end of the tunnel is sized for a finished diameter of 96 in. Maximum velocity is expected to be about 4.6 ft/sec at the maximum future flow rate. The tunnel is fitted in places with removable cunnette inserts which provide the hydraulic characteristics of a 24-inch pipe for low flow conditions. Measures being taken to prevent hydrogen sulfide buildup in the tunnel along with the usually associated problems of odors and corrosion include: the provision of air-excluder gates at each inlet shaft and the use of specially designed inlet vortex chambers, T-lock polyvinyl chloride lining, and limestone coarse aggregate for the 12-inch concrete lining of the tunnel. In addition to relieving many existing sewers from periodic overflows, the all-gravity flow design of the crosstown interceptor reflects substantial long-range savings over the more conventional cut and cover alternative. FLOW DATA COLLECTION FOR INFILTRATION-INFLOW ANALYSIS,
Whitman, Requardt and Associates, Baltimore, Md.
J. S. Maynes.
Journal Water Pollution Control Federation, Vol 48, No 8, p 2055-2061, August, 1976. 2 fig, 4 ref.

Descriptors: *Cost-benefit analysis, *Inflow, *Infiltration, *Treatment facilities, *Leakage, Surface waters, Groundwater, Flow, Cities, Urban runoff, Runoff, Pumping plants, Maryland.
Identifiers: Baltimore.

An analysis of the cost-effectiveness of continuing to transport and treat inflow (leakage from surface run-off resulting from rainfall) and infiltration (leakage originating from the groundwater table) versus eliminating these flows through a rehabilitation program was performed for the Baltimore, Maryland area over a 20-year planning period. The amount of infiltration was determined by comparing the observed average daily flows with computed flows, and inflow was determined by comparing the observed peak flow rate resulting from rainfall with the flow rate from a twin-day comparison. The annual flow records for two treatment plants in the area revealed that infiltration composed about 30% of the average daily flow, while infiltration flows for pumping stations ranged between 1-62%. In general, it appeared to be more economical to continue to transport and treat these infiltration flows rather than to identify and correct the sources. An exception to this involved several pumping stations which required three or more repumping operations downstream before the flow arrived at the treatment plant. Inflow quantity, on the other hand, was found to equal one-half of a station's pumping capacity. It generally appeared to be more cost-effective to correct sources contributing to extraneous flows in valleys that were currently fully developed and did not have relief interceptors planned. SUSPENDED SLUDGE SCRAPER FOR ARCUATE SEDIMENTATION ZONE,
Union Carbide Corp., New York (Assignee)
J. F. Pelton
United States Patent 3,977,974. Issued August 31, 1976. Official Gazette of the United States Patent and Trademark Office, Vol 949, No 5, p 2027-2028, August, 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Separation techniques, *Sludge, *Sedimentation, Equipment, Waste treatment, Solid wastes, Liquid wastes, Design criteria.

A patent for a waste water treatment device that allows for separation of solids from the liquid in a sedimentation zone is described. The device consists of two circular concentric walls spaced apart to form an intermediate volume. A first radial partition extends across the intermediate volume and is joined at opposite edges to the inner and outer walls, while a second radial partition is similarly located and spaced from the first partition to form an arcuate sedimentation zone. Means for introducing a liquid-solid feed in the arcuate sedimentation zone are provided to achieve a solids-depleted liquid in the upper part of the zone and a layer of settled solids in the bottom part of the zone. Means are also provided for discharging the solids-depleted liquid from the upper zone and for collecting the settled solids from the bottom part of the zone. The solids collection means include a mechanically driven bridge which moves in an arcuate path around the arcuate sedimentation zone and a scraper blade extending transversely across the sedimentation zone at the bottom thereof. CLARIFICATION PLANT,
J. R. Kaelin.
United States Patent 3,979,294. Issued September 7, 1976. Official Gazette of the United States Patent and Trademark Office, Vol. 950, No. 1, p 265, September, 1976. 1 fig.

Descriptors: *Patents, *Activated sludge, *Biological treatment, *Sewage treatment, *Recycling, Oxygenation, Design criteria, Equipment, *Waste water treatment.

A patent for an activated sludge clarification plant is described which provides for recycling of the activated sludge. The plant consists of at least one gas-tight activation tank provided with a surface ventilation rotor, a reclarification tank, inlet means for supplying sewage to the activation tank, and outlet means for conducting activation sewage to the reclarification tank. A conduit with one of its ends vertically oriented in the activation tank directly below the surface ventilation rotor is connected at its other end to the reclarification tank for recycling activated sludge concentrate from the reclarification tank to the activation tank. An outlet aperture in one end of the conduit is located in the suction zone of the surface ventilation rotor such that the activated sludge in the conduit is sucked upward through the surface ventilation rotor zone. Means are also provided for supplying pure oxygen to the other end of the conduit for application to the concentrated recycled activated sludge prior to the sludge's entry into the surface ventilation rotor. FREEING WASTE WATER FROM NITROGENOUS CPDS - USING PARTIALLY OXIDISED SLUDGE AS SOURCE OF ORGANIC CARBON.
South African Patent ZA 7505-682. Issued September 5, 1975. Derwent French Patents Abstracts, Vol. X, No. 37, p D2-D3, August, 1976.

Descriptors: *Patents, *Waste water treatment, *Nitrogen compounds, *Nitrification, *Denitrification, Biological treatment, Oxidation, Chemical reactions, Liquid wastes, Chemical wastes, Nitrates, Nitrogen, Ammonia, Biomass, Microorganisms.

A patent for a process that removes nitrogen compounds from waste water is described. The process involves mixing the waste water with active nitrifying organisms and an oxygen-containing gas to convert the nitrogenous material to the nitrate form. The nitrifying organisms and accumulated biomass are then separated from the waste water and recycled to the nitrification contacting step. A portion of the accumulated biomass is either periodically or continuously removed from the nitrifying step. The nitrified waste water is then contacted with heterotrophic denitrifying bacteria in the presence of a source of organic carbon to reduce nitrate nitrogen to elemental nitrogen. The denitrifying organisms and accumulated biomass are separated from the waste water and recycled to the denitrification step, with a portion of the accumulated biomass being either periodically or continuously removed from the denitrifying step. The process is improved by heating the biomass removed from the nitrifying and denitrifying steps in the presence of an oxygen-containing gas at 175-315C at an oxygen partial pressure of 5-250 pounds/sq in to partially oxidize the biomass and convert the organic nitrogen to ammonia nitrogen. The solid phase is then separated from the liquid phase of the oxidized mixture; and after ammonia is removed from the liquid phase, the latter is directed to the denitrifying step as a source of carbon. COMBINED FILTER AND DRYER FOR SEWAGE SLUDGE ETC. - USES BAND OF VACUUM FILTER TO CARRY CAKE THROUGH FILTER PRESS.
French Patent FR 2289-453. Issued October 30, 1975. Derwent French Patents Abstracts, Vol. X, No. 36, p D4, May 28, 1976.

Descriptors: *Patents, *Sewage sludge, *Drying, *Sludge treatment, *Filters, Equipment, Waste treatment, Dewatering, Solid wastes, Filtration.

A patent for a sewage sludge filter and dryer combination is described. The device combines a vacuum band filter with a filtrate expressing unit. A porous band which carries the filter cake from its passage around a partly-immersed vacuum filter drum moves horizontally into the expressing unit where it is squeezed between a porous drainage plate below the band and a fluid-pressurized, impervious membrane above the cake. The machine is programmed so that the drum

otates periodically to advance the band only when he expressing unit is inactive. The device is useful or drying sludges prior to incineration and is easi- y installed. (Kreager-FIRL)

EWAGE SURFACE AERATOR - WITHOUT XIAL THRUST THUS REDUCING VIBRA- ION FROM WAVES.
German Patent DS 2120-576. Issued September 9, 976. Derwent German Patents Abstracts, Vol. X, No. 38, p D1, October 27, 1976.

Descriptors: *Patents, *Rotors, *Aeration, Sewage treatment, Flow, *Waste water treat- ment, Equipment, Design criteria, Liquid wastes.

A patent for a sewage surface aerator rotor that educes vibration from waves by avoiding axial hrust is descried. The aerator rotor consists of a riven vertical shaft to which several vanes are at- ached by means of a circular support. The vanes e in vertical planes containing the rotor axis or lanes parallel to it which extend beyond the edge f the circular support when seen axially from bove. The vanes are at least partially immersed in he water. The effective surfaces of the rotor are rranged so that they do not produce any axial orce components, either individually or together. The vanes extend from the support first ownwards and outwards and then parallel to the haft in the region of immersion. The rotor is im- ersed in the water only to the point where in peration the support is either not subject to flow r only to flow in a direction free from axial thrust. (Kreager-FIRL)

DVANCED WASTE TREATMENT PLANT AS PHYSICAL-CHEMICAL OPTION,
ichart-Horn, Lewisburg, Pa.
L. McDowell, and M. Goldman.
blic Works, Vol. 107, No. 9, 2 p, September, 76.

scriptors: *Waste water treatment, *Tertiary atment, *Treatment facilities, *Municipal stes, *Biological treatment, Design criteria, occulation, Chlorination, Aeration, Oxidation, uipment, Filtration, Chemical oxygen demand, spended solids, Liquid wastes.

The design of an advanced municipal waste water treatment plant with physical-chemical options is described. Waste water passes through a grit chamber and comminutor to a pumping station, and the pumped wastes are discharged directly to twin oxidation ditches which are circular and have a common wall. The oxidation ditches are designed to provide a 24-hour retention period at a design flow rate of 130,000 gallons/day. The remaining plant features to achieve advanced waste water treatment consist of triple-media filters (equipped for backwash and surface wash) operating in conjunction with flocculation equipment and tube settlers plus a chlorine contact tank. An aerated equalization tank of reinforced concrete intervenes between the clarifier and filter complex to maintain a constant feed to the filters. The flocculator and tube settler are incorporated into the design for phosphorus removal if desired or for physical chemical treatment of raw waste water. A chemical feed system is also built into the plant for phosphorus removal. A chlorine contact tank capable of dosing up to 27 pounds of chlorine/day at the design flow also serves as a reservoir for filter backwash water. The filtered effluent is expected to have a chemical oxygen demand of 25 milligrams/liter and a suspended solids level of 4 milligrams/liter. (Kreager-FIRL)

PHOSPHORUS REMOVAL WITH ALUM FROM SECONDARY EFFLUENT,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
D. E. Francisco, M. Strauss, and B. A. Dempsey.
Journal Water Pollution Control Federation, Vol. 48, No. 8, p 2002-2006, August, 1976. 1 fig, 5 tab, 12 ref.

Descriptors: *Waste water treatment, *Phosphorus, *Phosphates, *Chemical wastes, *Chemical properties, Biological treatment, Performance, Efficiencies, Evaluation, Calcium, Hardness(Water).
Identifiers: Alum, Sodium tripolyphosphate.

The effect of sodium tripolyphosphate on alum removal of phosphorus from synthetic raw waste water samples was investigated. Waste waters containing different forms of phosphorus (orthophosphate, sodium tripolyphosphate, and combinations of the two) were biologically treated in a 5-hour detention activated sludge unit prior to the treatment of the effluents with alum in a jar test apparatus. While phosphorus removal increased with alum dosage to an alum:phosphorus ratio of 1.8 in all samples, there were no significant differences between the samples in terms of alum requirements for phosphorus removal. Thus, previous findings suggesting that sodium tripolyphosphate raises the alum requirement for phosphorus removal in waste water were not duplicated in this study. Apparently some other constituent in the waste water, either alone or in combination with sodium tripolyphosphate, was responsible for previously observed alum requirement increases. The effect of calcium hardness on phosphorus removal by alum was also investigated, and a hardness of 150 milligrams/liter was found to decrease the amount of alum required for an equivalent alum dosage. (Kreager-FIRL)
W77-02346

DENITRIFICATION OF NITRIFIED SEPTIC TANK EFFLUENT,
Wisconsin Univ., Madison. Dept. of Soil Science.
L. J. Sikora, and D. R. Keeney.
Journal Water Pollution Control Federation, Vol. 48, No. 8, p 2018-2025, August, 1976. 7 fig, 2 tab, 26 ref.

Descriptors: *Denitrification, *Septic tanks, *Feasibility studies, *Waste water treatment, *Nitrates, Kinetics, Chemical reactions, Monitoring, Oxidation, Reduction(Chemical), Performance, Measurement, Limestones, Alcohols.
Identifiers: Methanol.

Denitrification of nitrified septic tank effluent was achieved in continuous flow columns packed with limestone chips using methanol as an energy source. Nearly complete nitrate removal was attained in 17 hr at 5 C, 13 hr at 13 D, and in less than 2 hr at 20 C. The general kinetics of the systems were best depicted as first order. An Arrhenius relationship was also demonstrated, with the calculated activation energy being 12.25 kilocalories/mole of nitrate nitrogen. Nitrogen was the gas detected in highest concentrations, but oxygen, methane, and occasionally carbon dioxide were also present in the system. Oxidation-reduction potentials in the columns were generally in the 100-200 millivolt range. The performance of in situ oxidation-reduction electrodes during the denitrification experiment demonstrated their potential use for monitoring the efficiency of operating field systems. Carbon analyses performed during denitrification at 5 C revealed a ratio of 0.89 milligrams of methanol carbon oxidized to 1 milligram of nitrate nitrogen reduced.
W77-02347

WASTE WATER PROCESSING WITH HGMS (HIGH GRADIENT MAGNETIC SEPARATORS),
Bechtel International Corp., San Francisco, Calif.
R. R. Oder, and B. I. Horst.
Filtration and Separation, Vol. 13, No. 4, p 363-364, 366, 368-369, 377, July/August, 1976. 5 fig, 10 tab, 15 ref.

Descriptors: *Waste water treatment, *Suspended solids, *Tertiary treatment, *Magnetic studies, *Separation techniques, Liquid wastes, Economics, Feasibility, Efficiencies, Municipal wastes.
Identifiers: *High gradient magnetic separators.

A conceptual process for high gradient magnetic separation treatment of municipal secondary effluent based on recent bench-top laboratory results was used as a model for comparison with more conventional solids separation techniques. The conceptual process is designed for 80-90% solids reduction when processing typical municipal secondary effluents containing a nominal 50 ppm suspended solids. Estimated high gradient magnetic separator treatment costs for waste water treatment plants with 1, 10, and 100 million gallon/day capacities were 68, 22, and 15 cents, respectively. For process capacities of 10 million gallons/day, these costs compare favorably with those of conventional two-stage tertiary lime treatment. In addition, high gradient magnetic separators also offer economy of space. (Kreager-FIRL)
W77-02348

NITRIFICATION IN HIGH-SLUDGE AGE CONTACT STABILIZATION,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
J. Zoltek, Jr., and L. Lefebvre.
Journal Water Pollution Control Federation, Vol. 48, No. 9, p 2183-2189, September, 1976. 4 fig, 1 tab, 11 ref.

Descriptors: *Nitrification, *Waste water treatment, *Activated sludge, *Kinetics, *Ammonium compounds, *Nitrogen compounds, Organic compounds, Nitrates, Chemical reactions, Biological treatment, Oxidation, Feasibility studies, Aeration.
Identifiers: *Contact stabilization.

Nitrification of raw waste water in a high-sludge age, contact-stabilization activated sludge plant was investigated. The unit substrate (ammonium ion nitrogen) removal rate was directly proportional to the overall substrate removal rate and inversely proportional to the mass of the activated sludge. Initial hydrolysis of organic nitrogen to ammonia proceeded quite rapidly during the early stages of aeration for raw waste water, but then

U. OF I. URBANA-CHAMPAIGN

began to level off at a very slow rate. Unless the return sludge ratio is very high, contact stabilization modification of activated sludge systems does not appear to be feasible for producing a substantial degree of oxidation of ammonia nitrogen and organic nitrogen to nitrate nitrogen when raw waste is treated. MINNEAPOLIS-ST. PAUL: LAND OF THE 'SHINING BIG-SEA-WATERS',
Metropolitan Waste Control Commission, St. Paul, Minn.
T. J. Vandervoort, and K. A. Denisen.
Journal Water Pollution Control Federation, Vol. 48, No. 9, p 2107-2113, September, 1976.

Descriptors: *Waste water treatment, *Water quality, *Water pollution control, *Treatment facilities, *Minnesota, Surface waters, Rivers, Lakes, Biological oxygen demand, Dissolved oxygen, Suspended solids, Construction, Sewers, Programs, Monitoring, Municipal wastes.
Identifiers: *Minneapolis-Saint Paul(Minn).

Efforts by the Minneapolis-Saint Paul Metropolitan Waste Control Commission to upgrade waste water treatment facilities in the area and to improve the water quality of lakes and rivers in the region are reviewed. Only three of 33 waste water treatment plants in 1971 met all state and federal effluent standards consistently, and the overall average removal efficiencies of biochemical oxygen demand and total suspended solids were 68% and 78%, respectively. Since that time, seven outmoded waste water treatment plants have been phased out, and existing plants have been upgraded so that by the end of 1974, 13 out of 21 treatment plants consistently met the secondary treatment definition set forth by the Environmental Protection Agency. In 1973 two new treatment plants were placed in operation, one being the first full-scale physical-chemical treatment facility in the nation. Nearly 100 miles of new sewer interceptors were also constructed. During 1975 the Commission routinely sampled 26 locations on six rivers and one creek for over 50 water quality parameters. Dissolved oxygen concentrations in the Mississippi, Minnesota, and Saint Croix Rivers during 1975 were never below the 5 milligram/liter standard in contrast to dissolved oxygen concentrations of below 1 milligram/liter which were observed in 1970. HEAVY METALS-INDUCED DEFLOCCULATION OF ACTIVATED SLUDGE,
Pittsburgh Univ., Pa. Water and Environmental Engineering Program.
R. D. Neufeld.
Journal Water Pollution Control Federation, Vol. 48, No. 8, p 1940-1947, August, 1976. 11 fig, 9 ref.

Descriptors: *Activated sludge, *Waste water treatment, *Heavy metals, *Flocculation, *Biological treatment, Biomass, Performance, Sludge, Microorganisms.
Identifiers: *Deflocculation.

The influence of shock loadings of heavy metals (mercury, cadmium, and zinc) on activated sludge deflocculation was investigated in cultures maintained in a captive condition with no deliberate sludge wasting. No operational difficulties in terms of the underflow control of gravity cell separators are anticipated based on the above experiments, but potential problems involving the possibility of substantial loss of biomass in the form of pinpoint discrete solids over the effluent weir of gravity separators can be expected as a result of heavy metal shock loadings. Such problems may be overcome by using polyelectrolytes or other types of liquid solid separators (sand filters for effluent polishing or continuous centrifuges for cell separation) in conjunction with cell recycling. Maximum deflocculation in the experimental continuous culture system used occurred after 3-4 days for mercury addition, 12-14 days for cadmium addition, and 10-12 days for zinc addition. While deflocculation did not result at cadmium and zinc levels lower than 20 or 40 milligrams/liter, respectively, virtually any mercury level resulted in some degree of deflocculation. SALT WATER DOMESTIC WASTE TREATMENT,
Rice Univ., Houston, Tex. Dept. of Environmental Science and Engineering.
M. A. Kessick, and K. L. Manchen.
Journal Water Pollution Control Federation, Vol. 48, No. 9, p 2131-2136, September, 1976. 6 fig, 17 ref.

Descriptors: *Domestic wastes, *Saline water, *Waste water treatment, *Water conservation, *Coagulation, Flocculation, Organic compounds, Suspended solids, Turbidity, Biodegradation, Bacteria, Salinity, Physical properties, Chemical properties, Waste disposal, Lime.
Identifiers: Alum.

The feasibility of using salt water as a flush medium for domestic wastes was investigated, with particular emphasis on the effect of salt water wastes on coagulation and flocculation processes which are normally used in the first step of any physical-chemical treatment process. Laboratory experiments with samples of primary domestic waste water containing sea salts indicated that increasing the salt content of such waste water causes no net precipitation or salting out of organic material. Alum and lime proved to be effective coagulants for simulated salt water domestic waste. Alum coagulation was equally effective for turbidity and organic content removal in both fresh and salt water waste samples; while the addition of lime was associated with an increase in the nonsettleable organic fraction, although the turbidity was still reduced. Biodegradation of the soluble fraction of domestic waste with resident bacteria was unaffected by sea salt to levels expected in a seawater waste system. However, sea salt addition markedly inhibited the biodegradation of the suspended fraction. Thus, if the suspended fraction of salt water domestic wastes is dumped in the ocean, it may not exert an oxygen demand equivalent to that exerted in freshwater environments when metabolized by members of the waste's own resident microbial population. SOLAR SEWAGE PLANT 75% ENERGY SELF-SUFFICIENT.
Engineering News-Record, Vol. 197, No. 12, p 20, September, 1976. 1 fig.

Descriptors: *Waste water treatment, *Municipal wastes, *Treatment facilities, *Solar radiation, *Recycling, Biological treatment, Heat transfer, Symbiosis, Economics, Energy transfer, Methane, Construction, Design criteria, Liquid wastes, Maine.

The design of a 450,000-gallons/day primary and secondary waste water treatment plant that will treat waste water from 4200 residents of rural Wilton, Maine, using solar energy as an integral part of the biological treatment process is described. The sun's radiance will heat the process via solar collectors from the time waste water enters the plant through economical screw pumps until the treated effluent is passed through energy recycling heat pumps and out into a small stream. The plant's components are to be stacked and com pacted to conserve heat and to allow waste wate to flow in short runs, for the most part by gravity The building is shaped to hold snow on the roo and sides for natural insulation and is located in man-made dish so that sunlight reflecting of snow-covered hills can be used for heating Methane gas which is generated by the sludg digestion process will be stored in tanks for heat ing the building on rainy days, running an electri generator, and for use as a back-up heat source fo the digesters. The projected result is a treatmen plant that will supply more than 75% of its ow energy requirements, saving roughly $4450/yr i fuel and electricity costs. (Kreager-FIRL)

THE INFLUENCE OF THE RAW WATER CON DITIONING ON THE WORKING DATA OF REVERSE OSMOSIS PLANT TO PRODUC ULTRA-PURE WATER (EINFLUSS DER ROH WASSERKONDITIONIERUNG AUF BETRIEB SDATEN EINER UMKEHROSMOSE-ANLAG ZU REINSTWASSERERZEUGUNG),
O. K. Marquardt.
Vom Wasser, Vol. 45, p 129-158, 1975. 13 fig, tab.

Descriptors: *Reverse osmosis, *Desalination *Waste water treatment, *Reclaimed wate *Saline water, Reclamation, Liquid wastes, Per formance, Ion exchange, Fouling.

The use of reverse osmosis to produce reclaime water from water contaminated by salt discussed, with particular emphasis on the im portance of raw water preconditioning. Less tha satisfactory performance obtained with revers osmosis units in the past is attributed to a lack o raw water pretreatment which is especially impor tant when polyamide hollow fiber-membranes a used in reverse osmosis units. Raw water condi tioning will reduce the fouling index of reverse os mosis units such that special rinses are necessar only at infrequent intervals. The use of raw wate conditioning to reduce the passage of salt throug reverse osmosis units also allows for the effectiv utilization of ion exchange treatment after th reverse osmosis process. SPRAY IRRIGATION SOLVES DISPOSA PROBLEM,
Van Note-Harvey Associates, Princeton, N.J.
W. B. Harvey.
Water and Wastes Engineering, Vol. 13, No. 10, 31-33, October, 1976.

Descriptors: *Irrigation, *Waste water disposal *Waste water treatment, Spraying, *Municipa wastes, Crops, Biological treatment, Tertiary treatment, Aeration, Chlorination, Pumps Valves, Symbiosis, Water reuse, Monitoring Sampling activated sludge, Farms, New Jersey.
Identifiers: *Spray irrigation.

A spray irrigation system that will ultimately remove 1.0 million gallons/day of municipa wastes from direct river discharge is described The system which is located in East Windsor, New Jersey is one of the largest municipal spray irriga tion applications in the northeast, serving a popu lation of about 20,000. Sewage first enters a pump ing station where it is screened for the removal o fibrous material. It is then pumped to a 300,00 gallon equalization basin, and heavier grit and in organic material are settled in a conical section o the basin's bottom. Effluent from the basin is the pumped to activated sludge units, and the flow i subsequently polished in an aerated lagoon whic provides tertiary treatment. After tertiary treat ment, the effluent is chlorinated. Two deep-wel turbine pumps lift the polished effluent to the ir rigation site where 80 acres of hay are treated with 600,000 million gallons/day of the effluent. Dif ferent valve combinations are used to achieve the

proper waste water application over different portions of the site. A network of 13 test wells is located throughout the site to sample groundwater. (Kreager-FIRL)

FEASIBILITY OF HIGH-ENERGY ELECTRON TREATMENT OF MUNICIPAL SLUDGE,
Massachusetts Inst. of Tech., Cambridge. Dept of Electrical Engineering and Computer Science.
J. G. Trump, K. A. Wright, A. J. Sinskey, E. W. Merrill, and D. B. Shah.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 367-374, 1975. 9 fig, 9 ref.

Descriptors: *Waste water treatment, *Sludge treatment, *Municipal wastes, *Ionization, Feasibility studies, *Disinfection, Electronics, Bacteria, Viruses, Parasitism, Economics, Chemical oxygen demand, Radiation.
Identifiers: Ionizing radiation, *Electron beam treatment.

Studies on the feasibility of using high-energy electrons for the disinfection of municipal sludge and waste water are reported. Small quantity irradiation studies using a 3-million electron volt Van de Graaff electron accelerator indicate that high energy electrons can be used to adequately control bacteria, viruses, and parasites. In addition to primary disinfection and deinfestation of waste water and sludge, electron radiation also appears capable of achieving substantial chemical oxygen demand reductions if adequate oxygen is available. Currently, an investigative system for testing 100,000 gallons/day of sludge with 400,000 rads is being constructed. The facility will use a standard 50 kilowatt electron beam system. Capital and operating cost estimates for a modular electron injection unit capable of treating 100,000 gallons/day of sludge are projected at $500,000 and $100,000/yr, assuming that 450,000 rads proves to be an adequate minimum dosage and that electron beam power can be utilized to produce this minimum dosage with an overall utilization efficiency of 33.3%. WASTEWATER REUSE-INDUSTRIAL, MUNICIPAL, OR BOTH,
Maintenance Engineering Corp., Houston, Tex.
B. R. Fritsche, and R. W. Schima.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 242-247, 1975. 3 tab.

Descriptors: *Water reuse, *Waste water treatment, *Industrial wastes, *Municipal wastes, Industrial water, Reclaimed water, Recycling, Symbiosis, Liquid wastes, Dissolved solids, Phosphorus, Ammonia, Sodium, Chlorides.

The reuse of industrial and/or municipal waste water for industrial water needs is discussed. Although municipal waste water is adaptable for limited reuse (cooling water and process water) with minor pretreatment, municipal treatment processes increase the total dissolved solids level (sodium and chloride) significantly which in turn increases water consumption, pretreatment costs, and internal treatment costs. Such increases in total dissolved solids do not occur in industrial process waste water. Also, if municipal waste water is to be used in steam generation systems, phosphorus removal is necessary; ammonia removal may also be necessary, depending on the use of the steam. The only type of industrial waste water that can be considered for reuse is process waste water since cooling water and boiler water blowdowns are normally concentrated with respect to scale formation and corrosion, making these streams impracticable for reuse under circumstances where further concentration occurs or adverse conditions exist. Although industrial waste water may contain process contaminants which must be removed prior to reuse, the utilization of industrial waste water may significantly reduce water consumption requirements. OPEN TANK PURE OXYGEN SYSTEM BEGINS OPERATION,
Illinois State Univ., Normal. Coll. of Applied Science and Technology.
A. R. Jacobson.
Public Works, Vol. 107, No. 9, p 106, September, 1976.

Descriptors: *Activated sludge, *Sewage treatment, *Municipal wastes, *Oxygenation, *On-site tests, Aerobic conditions, Performance, Evaluation, Efficiencies, Treatment facilities.

A pure oxygen activated sludge demonstration system using uncovered tanks has begun operation under a grant from the Environmental Protection Agency at the Metropolitan Denver Sewage Disposal District Number 1 Plant. For the demonstration, one of 36 diffused air activated sludge basins was converted to an open-tank oxygen system by installing rotating active diffusers and associated oxygen control equipment suited to a wide range of loading conditions. Effluent from this tank passes to one of 12 final clarifiers which has been isolated from the rest of the plant. The diffusers rotate slowly in the mixed liquor, producing very fine micron-size bubbles that achieved 90% or greater oxygen transfer. Electrical signals from dissolved oxygen sensors automatically regulate pneumatic oxygen control valves to satisfy the oxygen demand for a given point in the basin. The limiting factor of the system will be the solids and hydraulic loadings of the single clarifier. During the last phase of the project, the flow will be increased in steps from its current 10 million gallons/day until the upper operating limit of the system is determined. (Kreager-FIRL)

EFFICIENCY OF DIFFUSED AERATION SYSTEMS IN WASTEWATER TREATMENT,
British Columbia Univ., Vancouver. Dept. of Civil Engineering.
D. S. Mavinic, and J. K. Bewtra.
Journal Water Pollution Control Federation, Vol. 48, No. 10, p 2273-2283, October, 1976. 11 fig, 1 tab, 7 ref.

Descriptors: *Activated sludge, *Waste water treatment, *Aeration, *Oxygenation, Biological treatment, Bubbles, Flow characteristics, Efficiencies, Performance.
Identifiers: Diffused aeration systems.

Factors affecting the oxygenation efficiency of diffused aeration systems employed in activated sludge waste water treatment are examined. A process of aeration using a countercurrent flow of air bubbles and waste water is shown to result in increased contact time and thus higher oxygenation efficiencies. The operating conditions of the system are such that the average velocity of the water is equal to or less than the velocity of the rising air bubble in order to provide maximum contact times for countercurrent flow of air and water. The process can possibly be adapted to existing conventional aeration systems so that treatment efficiency can be improved. (Kreager-FIRL)

WASTEWATER PLANT DOES NICELY WITHOUT NATURAL GAS, THANK YOU,
Reading Sewage Treatment Plant, Pa.
L. Karnat.
Water and Wastes Engineering, Vol. 13, No. 10, p 25-26, October, 1976.

Descriptors: *Sewage treatment, *Treatment facilities, *Methane, *Energy conversion, *Digestion, Monitoring, Waste water treatment, Municipal wastes, Cities, Pennsylvania.
Identifiers: Reading(Penn), Fuel generation.

The use of on-site methane generation for supplying waste water treatment fuel gas needs at the sewage treatment plant in Reading, Pennsylvania is described. The plant produces an average of 150,000 cu ft of methane/day which is enough to supply heat for the two primary digesters and one secondary digester plus heat for two of the plant buildings. Methane is metered via two rotating-vaine type positive displacement meters installed on each of the two primary digesters. While measuring methane production, the meters also indicate whether the digesters are operating properly and show the amount of methane used to heat the digesters. The meters are also equipped with flow-totalizing readouts to provide statistical information on methane production required by the Commonwealth of Pennsylvania. Surplus methane is burned off by flares. (Kreager-FIRL)

DEGRADATION OF NTA ACID DURING ANAEROBIC DIGESTION,
Municipal Environmental Research Lab., Cincinnati, Ohio.
L. Moore, and E. F. Barth.
Journal Water Pollution Control Federation, Vol. 48, No. 10, p 2406-2409, October, 1976. 3 fig, 1 tab, 3 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Biodegradation, *Detergents, *Anaerobic conditions, Organic acids, Salts, Sludge, Performance, Evaluation, Biological treatment, *Nitrilotriacetic acid.
Identifiers: Sodium nitrilotriacetic acid, Detergent additives.

The degradability of the sodium salt of nitrilotriacetic acid, a proposed substitute for tripolyphosphate in synthetic detergent formulations, during anaerobic digestion of primary sludge and a mixture of primary and waste activated sludge was investigated. Experiments involving the addition of 20 milligrams/liter of the nitrilotriacetic acid salt to an anaerobic system containing only primary sludge did not reveal any degradation of the salt over a period of 120 days. However, when 20 milligrams/liter of the salt was added to an anaerobic system containing 50% primary sludge and 50% waste activated sludge that was acclimated to the degradation of sodium nitrilotriacetate, almost complete degradation was observed after 2 months. When this mixture of primary sludge and acclimated waste activated sludge was gradually returned over a 20-day period to a daily feed consisting entirely of primary sludge, degradation continued, indicating that the acclimated culture can be retained in the digestion process when the daily feed is returned to zero. DIGESTION IS A GOOD EGG IN LOS ANGELES,
J. F. Kam, and J. F. Schank.
Water and Wastes Engineering, Vol. 13, No. 10, p 28-29, October, 1976.

Descriptors: *Digestion tanks, *Construction, *Design criteria, *Waste water treatment, *Concrete structures, Equipment, Materials, Scum, Coatings, Corrosion control, Anaerobic conditions, California.
Identifiers: Grit, Los Angeles(Calif).

COPY 1 OF 1 URBANA-CHAMPAIGN

The use of egg-shaped anaerobic digestion tanks for a waste water treatment plant in the city of Los Angeles is reported. The tanks which are patterned after a German design possess the advantage that they don't accumulate grit and scum. The shell of the digester is built with post-tensioned concrete, with the bottom of the container being as steep as possible (generally under 45 degrees inclined from verticle) so that the digested sludge flows by gravity into the tip of the hopper. The digester reduces in area in an upward direction so that the scum area stays small compared with the digesting area. Dead corners that form deposit are avoided. Digester gas is bubbled at the circumference of the lower tank area to intensify the digestion and prevent scum formation. Screw impellers for scum destruction are installed at the top of the digesters. The inside of the digester above the sludge level is epoxy coated for corrosion protection. The middle section of the digester is constructed in sections (like an orange peel), whereby the forming and scaffolding are built for one section at a time, rotated into place, and used repeatedly. PILOT PLANT TRAVELS ON WHEELS.
The American City and County, Vol. 91, No. 10, p 98, October, 1976.

Descriptors: *Waste water treatment, *Pilot plants, *Sludge, *Dewatering, *Municipal wastes, Cities, *Treatment facilities, Evaluation, Performance, Alabama.
Identifiers: Birmingham.

A mobile pilot plant for evaluatiang the effectiveness of a clay-polymer drainage and evaporation system in improving the sludge clarification capabilities of two waste water treatment plants in the city of Birmingham, Alabama is described. The mobile plant is able to treat up to 100 million gallons/day of water during the clay-polymer test. Tests at a treatment facility with an 8.5 million gallons/day flow revealed that polymer and clay levels of 2.0 ppm and 8.0 ppm, respectively, were sufficient to obtain results that were superior to those obtained with conventional alum treatment. At a treatment plant with an average flow up to 50 million gallons/day, 1.2 ppm of polycationic polymer and 9.0 ppm of clay were used. The clay-polymer system produces finished water of good clarity and a low volume of sludge with good handling and dewatering properties. (Kreager-FIRL)

FLUID-BED REACTOR MAY CUT SEWAGE COSTS.
The American City and County, Vol. 91, No. 10, p 26, October, 1976.

Descriptors: *Biological treatment, *Activated sludge, *Waste water treatment, *Nitrification, *Denitrification, Domestic wastes, Municipal wastes, Pilot plants, Efficiencies, Evaluation, Performance, Economics, Tertiary treatment, Biomass.

A fluidized bed biological waste water treatment process that is potentially capable of reducing treatment plant capital costs for some municipalities is described. The process provides secondary biological treatment, nitrification, and denitrification for domestic sewage. The fluidized-bed reactors take up only one-fifth the space a standard activated sludge system requires. The process eliminates the huge concrete tanks and basins required for conventional waste water treatment by substituting compact fluidized bed reactors containing bacteria-coated media with a high biomass concentration and a short detention time. A pilot installation located at an advanced waste water treatment plant is achieving better than 99% denitrification. (Kreager-FIRL)

THERMOPHILLIC BIO-OXIDATION OF HIGH-STRENGTH ORGANIC WASTEWATERS AND SLUDGES,
Camp, Dresser and McKee Inc., Boston, Mass.
A. A. Kalinske.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 34-40, 1975. 2 fig, 3 tab, 13 ref.

Descriptors: *Biological treatment, *Waste water treatment, *Sludge treatment, *Thermophilic bacteria, *Activated sludge, Solid wastes, Temperature, Aerobic conditions, Microorganisms, Biochemical oxygen demand, Organic compounds, Digestion, Sewage sludge, Feasibility studies, *Oxidation.
Identifiers: Composting, *Bio-oxidation.

Processes for the thermophilic bio-oxidation of waste water and sludges containing high levels of organics are discussed. Thermophilic activated sludge treatment of waste waters with high levels of soluble organics appears to be feasible, especially if the waste water originates at a temperature of 40C or higher. At a 5-day biochemical oxygen demand above about 30 g/liter, sufficient heat can be generated so that the process is self-sustaining as far as temperature is concerned. Thermophilic organisms do not appear to have bioflocculating properties; thus their removal by plain settling is not possible. Aerobic digestion of sewage sludges and other organic solid wastes in liquid suspensions at high mesophilic and thermophilic temperatures (35-60C) is possible and can be self-sustaining at volatile solids concentrations above 3%. Composting of organic solid wastes by thermophilic aerobic organisms also appears feasible. Tests with a mechanical composting unit handling dewatered sewage solids having 75% moisture revealed that at a temperature of 60C and a retention time of about 6 days all pathogens were killed or inactivated. Recycle and forced aeration were used to achieve a final composted solids with a moisture content of 25% and a 6-day stabilization time. (Kreager-FIRL)

STUDIES OF THE REMOVAL OF AMMONIA NITROGEN BY ION EXCHANGE,
Greeley and Hansen, Chicago, Ill.
T. E. Wilson, and M. D. Riddell.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 118-125, 1975. 4 fig, 4 tab, 9 ref.

Descriptors: *Ion exchange, *Waste water treatment, Ammonia, *Zeolites, *Activated sludge, *Nitrogen compounds, Calcium, Pilot plants, Performance, Effluents, Liquid wastes, Municipal wastes, Treatment facilities, Separation techniques.
Identifiers: Clinoptilolite, *Ammonia nitrogen.

Pilot studies to evaluate the effectiveness of an ion exchange process using the natural zeolite, clinoptilolite, for removing ammonia nitrogen from the filtered secondary effluent generated by an activated sludge municipal waste water treatment plant were conducted. Ion exchange beds (6-feet deep) consisting of two columns with 3 ft of media were used. A sodium chloride-sodium hydroxide brine was generally used for regeneration of clinoptilolite. Effluent ammonia nitrogen levels often averaged less than 1.0 milligrams/liter for one-column operational mode but commonly averaged closer to 1.5 milligrams/liter for two-column operation. The calcium content of the influent did not appear to affect either the effluent ammonia concentration or the clinoptilolite's ammonia capacity. Calcium breakthrough tended to precede ammonia breakthrough and thus might be used as an early indicator of ammonia breakthrough. Both the ammonia and calcium capacities of the clinoptilolite tended to decrease with increasing hydraulic loading. Activated carbon pretreatment had no effect on effluent ammonia concentration. (Kreager-FIRL)

RECOVERY AND REUSE OF ALUM FROM WATER FILTRATION PLANT SLUDGE BY ULTRAFILTRATION,
Massachusetts Univ., Amherst. Environmental Engineering.
E. E. Lindsey, and C. Tongkasame.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 185-192, 1975. 5 fig, 2 tab, 6 ref.

Descriptors: *Sludge treatment, *Recycling, *Aluminum, *Waste water treatment, *Filtration, Byproducts, Membrane processes, Economics, Coagulation, Sludge disposal, Symbiosis, Color, Organic compounds
Identifiers: Alum, *Ultrafiltration.

A system for the recovery and reuse of alum from water filtration plant sludge by ultrafiltration is described. The settled, used sludge from water treatment is acidified with sulfuric acid to a pH of about 2.5, and the clarified overflow from the acidification is subjected to ultrafiltration at a pressure differential of about 50 lb/sq in with an acid-resistant synthetic copolymer membrane. A portion of the solution which does not go through the membrane contains most of the color and the high molecular weight organics removed by the alum floc. Since the underflow from acidification is relatively small in volume and more easily dewaterable, there is a greatly reduced problem in ultimate disposal. The solution through the membrane contains up to 90% of the original aluminum in a soluble form that is suitable for reuse as a coagulant after pH adjustment. A cost comparison with other means of sludge disposal such as landfill shows that the recovery system can result in significant savings. (Kreager-FIRL)

ASPECTS OF SLUDGE TREATMENT,
F. A. Shabi, and M. J. Hanbury.
Effluent and Water Treatment Journal, Vol. 16, No. 7, p 343-346, 350-351, July, 1976. 2 fig, 5 tab, 7 ref.

Descriptors: *Sludge treatment, *Dewatering, *Coagulation, *Anaerobic conditions, *Oxidation, Waste treatment, Filtration, Centrifugation, Flocculation, Solid wastes, *Waste water treatment, Liquid wastes, Separation techniques, Treatment facilities, Polyelectrolytes.

Waste water sludge treatment processes being utilized in Great Britain are reviewed. The most widely used sludge treatment process in Great Britain is anaerobic digestion which serves about half of Britain's population. Dewatering by mechanical means (filter press, vacuum filtration, and centrifugation), however, is becoming increasingly more attractive both in terms of cost and convenience. Sludge pretreatment to achieve flocculation or coagulation of the sludge particles is achieved either by thermal conditioning or by the addition of chemical coagulants. The development of polyelectrolytes which can be added in very small quantities (about 1%) to achieve sludge particle coagulation has improved the efficiency of sludge mechanical dewatering systems as illustrated by a sludge concentrator which is capable of producing a cake with a solids content in the range of 8-16%. The use of wet air oxidation in waste water treatment is another means of making the residual sludge more amenable to dewatering. At one facility using this waste water treatment modality, the utilization of overloaded drying beds was extended by eight-fold, while the sludge volume was reduced by over 80%. (Kreager-FIRL)

A DISCOURSE ON THE BIOCHEMICAL OXIDATION OF SEWAGE,
T. Stones.
Effluent and Water Treatment Journal, Vol. 16, No. 7, p 352-355, July, 1976. 4 tab, 21 ref.

Descriptors: *Sewage treatment, *Biological treatment, *Kinetics, *Biochemical oxygen demand, *Dissolved oxygen, Domestic wastes, Nitrification, *Oxidation, Chemical reactions, *Waste water treatment, Oxygen demand.

The kinetics of the biochemical oxidation of settled domestic sewage was investigated. Data obtained from experiments in which the dissolved oxygen contents of portions of 1/100 dilution of settled domestic sewage were determined at various intervals during incubation over 20 days at 20C were substituted into an expression for a second-order reaction. The results was a reasonably constant value throughout a period of about 10 days. During this period, therefore, the course of biochemical oxidation closely followed a second-order reaction, with the rate of oxidation at any instant over this period being governed jointly by the residual dissolved oxygen concentration and the unsatisfied biochemical oxygen demand. After a slight fall in the velocity coefficient value during the first 5 days, however, there was a gradual increase which became more rapid after the 10th day. This was presumably due to the onset of nitrification, the occurrence of which did not become apparent until more than 15 days had elapsed. (Kreager-FIRL)

POLYMERS CUT COST OF PHOSPHORUS REMOVAL,
Thomas (Frank A.) and Associates, Inc., Willoughby, Ohio.
T. G. Check.
Water and Wastes Engineering, Vol. 13, No. 8, p 23-24, August, 1976. 1 fig, 2 tab.

Descriptors: *Tertiary treatment, *Phosphorus, *Polymers, *Waste water treatment, *Feasibility studies, Pilot plants, Costs, Ions, Coagulation, Flocculation, Sludge, Ohio.

A pilot plant study at a tertiary waste water treatment plant was conducted to investigate the feasibility of substituting wet or dry anionic polymers for sodium aluminate in the phosphorus removal system. The purpose of sodium aluminate or polymer addition is to achieve secondary coagulation and subsequent flocculation. Both Calgon WT 3000 (a dry powder) and Nalco 7744B (a liquid polymer) proved to be effective polymers for achieving the above purpose, with phosphorus concentrations of less than 1.0 milligrams/liter being achieved. Solids carryover was 10 milligrams/liter. Each polymer also resulted in the production of less sludge, thus reducing sludge pumping and lagoon capacity requirements. Using bulk delivery chemical costs, the total expense per month for the dry and liquid polymers is $80 and $116, respectivelyc as compared with $1100 for sodium aluminate. (Kreager-FIRL)

THEORETICAL MODEL FOR A SUBMERGED BIOLOGICAL FILTER,
Clarkson Coll. of Technology, Potsdam, N. Y. Dept. of Civil and Environmental Engineering.
P. A. Jennings, V. L. Snoeyink, and E. S. K. Chian.
Biotechnology and Bioengineering, Vol. 18, No. 9, p 1249-1273, September, 1976. 12 fig, 2 tab, 16 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Mathematical models, *Kinetics, *Liquid wastes, Waste treatment, Equations, Surfaces, Model studies, *Filters.
Identifiers: *Biological filters.

A mathematical model for describing the biological removal of a single substrate from waste water in a porous bed of biolayer coated particles assuming plug flow and steady-state conditions is described. The model uses the nonlinear Monod expression for the substrate utilization rate. The approximation of this Monod expression by a first order rate expression yields accurate results for a much wider range of bulk concentrations than might be expected from inspection of the Monod half-velocity coefficient for a given substrate. Percent removal of substrate is a weak function of biolayer thickness when the thickness is greater than a rather small limiting value but is a strong function of particle radius (and thus biolayer surface area) for a wide range of parameter values including those of common interest. ENVIRONMENTAL IMPACTS OF LAND APPLICATION OF SLUDGE,
Metropolitan Sanitary District of Greater Chicago, Ill. Dept. of Research and Development.
D. R. Zenz, J. R. Peterson, D. L. Brooman, and C. Lue-Hing.
Journal Water Pollution Control Federation, Vol. 48, No. 10, p 2332-2342, October, 1976. 2 fig, 8 tab, 6 ref.

Descriptors: *Sludge disposal, *Soil amendments, *Reclamation, *Illinois, *Monitoring, Biochemical oxygen demand, Suspended solids, Coliforms, Surface water, Groundwater, Water quality, On-site investigations, Waste water treatment, Viruses, Fish, Metals, Recycling.
Identifiers: Land application, Fulton county(Ill), Chicago area(Ill).

The results of a 4-year environmental monitoring program conducted by the Metropolitan Sanitary District of Greater Chicago to determine the effects of land application of sludge in Fulton County are reported. Surface discharges from fields receiving digested sludge averaged suspended solids, biochemical oxygen demand, and fecal coliform levels of 60 milligrams/liter, 6.0 milligrams/liter, and 36 counts/100 milliliters (geometric means), respectively. The water quality of a major stream which drains the digested sludge application project was unaffected by surface water discharges, and groundwater monitoring wells showed no evidence of groundwater contamination. After 3 years of sludge application, metal levels in corn grain grown on digested sludge amended soils showed no significant increase. Virus levels monitored over a 2-year period at three surface water monitoring points were not influenced by sludge application to the surrounding watershed. Fish living in several reservoirs which receive discharges from fields to which digested sludge has been applied were not influenced by such applications. (Kreager-FIRL)

LANDFILL MANAGEMENT WITH LEACHATE RECYCLE AND TREATMENT: AN OVERVIEW,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
F. G. Pohland.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 159-167. 9 fig, 2 tab, 3 ref.

Descriptors: *Leachate, *Landfills, *Waste disposal, *Waste treatment, *Recycling, Organic compounds, Methane, Biological treatment, Adsorption, Ion exchange, Inorganic compounds, Simulation analysis, Efficiencies.

An overview of a leachate recycle/treatment concept is presented based on experiments with a simulated landfill constructed so that leachate could be recycled back in a manner analogous to the operation of an anaerobic trickling filter. Recirculation of leachate through the landfill promotes a more rapid development of anaerobic activity and methane fermentation, an increase in the rate and predictability of biological stabilization of organic pollutants in the waste, a significant decrease in the time required for stabilization, and a reduction of the potential for environmental impairment. Leachate recirculation with pH control and initial sludge seeding further enhances treatment efficiency so that the time required for biological stabilization of readily available organic pollutants in the leachate is reduced to months rather than years. The application of separate anaerobic and aerobic biological processes has also proven satisfactory for leachate treatment. Carbon adsorption is effective in removing residual organics and inorganics in the effluent when it is followed by mixed resin ion exchange. (See also W77-02394) (Kreager-FIRL)

ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES: CANE SUGAR REFINING,
Development Planning and Research Associates, Inc., Manhattan, Kans.
M. L. David, and R. J. Buzenberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 599, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-230/2-75-003, November 1975. 109 p. 2 fig., 34 tab. 68-01-1533.

Descriptors: *Economic impact, *Standards, *Water pollution control, *Effluents, *Sugar cane, Prices, Costs, Employment, Social impact, Industrial production, Foreign trade, Pollution abatement, Pricing, Industrial plants, Industrial wastes, Profits.
Identifiers: *Cane sugar refining industry, *Effluent guidelines, Plant closures.

This study supplements the EPA Effluent Limitation Guidelines analysis for the cane sugar refining industry by estimating the broader economic effects, such as price increases, effects on employment, foreign trade implications, and plant closures, which might result from application of pollution control technologies. Though all but 3 of the

U. S. DEPT. OF I. URBANA-LIBRARY

29 refineries are over 50 years old, all are well maintainedand technologically up-to-date. Imposition of effluent limitation standards are not expected to raise prices, though they will have a negative impact on the already weak profit structure of the industry. It is estimated that 7% of the plants with 5% of industry capacity will become marginal and 10% of the plants with 6% of industry capacity will probably close, as a result. Three to five small, rural communities, whose economic life is considerably dependent upon a cane sugar refinery and the related activities of area sugar cane growers and mills, will be significantly affected by these closures. Balance of payments effects will be felt to the degree that imported raw sugar was utilized and resulted in refined sugar exportation, and to the degree that such production losses will be affected by the increased use of substites. Compensatory actions of the Secretary of Agriculture will also be a very significant.factor. (Luedtke-Wisconsin)

DEVELOPMENT DOCUMENT FOR EFFLUENT LIMITATIONS GUIDELINES AND NEW SOURCE PERFORMANCE STANDARDS FOR THE FABRICATED AND RECLAIMED RUBBER SEGMENT OF THE RUBBER PROCESSING POINT SOURCE CATEGORY,
Environmental Protection Agency, Washington, D. C. Effuent Guidelines Div.
R. J. Kinch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-241 916, Price codes: A11 in paper copy, A01 in microfiche. Report No. EPA-440/1-74-030-a, December 1974. 249 p. 12 fig., 44 tab., 28 ref.

Descriptors: *Industrial wastes, *Technology, *Standards, *Effluents, *Waste water treatment, Economic impact, Capital costs, Annual costs, Pollution abatement, Federal Water Pollution Control Act, Water reuse, Recycling, Pollutants, Industries, Treatment facilities.
Identifiers: *Rubber processing industry, *Effluent guidelines.

Effluent limitation guidelines and new source performance standards for the fabricated and reclaimed rubber segment of the rubber processing industry to be achieved by July 1, 1977 and July 1, 1983 were developed. The industry is categorized by three major groups: (1) general molded, extruded, and fabricated products, (2) wet digestion, pan, dry digestion, and mechanical reclaimed rubber, and (3) latex-based products. This breakdown has been further subcategorized into seven subcategories on the basis of the manufacturing processes characteristics involved. Facility size, process waste water flow rates and loadings, costs of control technologies, final product, raw materials, plant age, geographical location, air pollution equipment, and the nature and treatability of waste waters using biological and physical/chemical treatment systems were considered. General molded, extruded, and fabricated rubber plant wastes should be treated for suspended solids, oil and grease, lead, and pH. BPCTCA, BATEA, and NSPS are equivalent for this group excet for an allowance for wet scrubbers. Incremental treatment costs to the small and medium size plants in this group are high. Reclaimed rubber plant waste waters are contaminated with BOD, COD, suspended solids, oil, and acidity/alkalinity, while latex product waste waters must be treated for BOD, suspended solids, oil, chromium or zinc, and pH. (Luedtke-Wisconsin)
W77-02415

DEVELOPMENT DOCUMENT FOR EFFLUENT LIMITATIONS GUIDELINES AND NEW SOURCE PERFORMANCE STANDARDS FOR THE FORMULATED FERTILIZER SEGMENT OF THE FERTILIZER MANUFACTURING, POINT SOURCE CATEGORY,
Environmental Protection Agency, Washington, D.C. Effluent Guidelines Div.
E. E. Martin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-240 863, Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA 440/1-75-042-a, January 1975. 79 p. 11 fig., 2 tab., 24 ref.

Descriptors: *Fertilizers, *Industrial wastes, *Standards, *Effluents, Ammonium compounds, Pollution abatement, Water pollution control, Waste water treatment, Water reuse, Recycling, Federal Water Pollution Control Act, Technology, Economic impact, Industrial plants, Costs.
Identifiers: *Zero discharge, *Effluent guidelines, Ammonium sulfate.

Effluent limitation guidelines and new source performance standards for the ammonium sulfate and mixed and blended segment of the fertilizer industry to be achieved by July 1, 1977 and July 1, 1983 were developed. Synthetic and coke oven byproduct production of ammonium sulfate are included. The mixed and blended fertilizers group represent by far the largest number of individual process plants in the overall fertilizer category. Use of treatment technologies such as manufacturing process control, recycle water systems, recovery and reuse of waste water, and dry collectors for air borne solids, which are currently utilized by better plants, make the recommended best practicable control technology currently available, the best available technology economically achieveable, and the new source performance standards identical and capable of zero discharge of process waste water pollutants to navigable waters. Factors considered in the analysis included total cost of technology application, size and age of facilities and equipment, the process employed, engineering aspects of control technology application, process changes, and ambient environmental impact including energy requirements. (Luedtke-Wisconsin).
W77-02419

DEVELOPMENT DOCUMENT FOR EFFLUENT LIMITATIONS GUIDELINES AND NEW SOURCE PERFORMANCE STANDARDS FOR THE PRIMARY ALUMINUM SMELTING SUBCATEGORY OF THE ALUMINUM SEGMENT OF THE NONFERROUS METALS MANUFACTURING, POINT SOURCE CATEGORY,
Environmental Protection Agency, Washington, D. C. Effluent Guidelines Div.
G. S. Thompson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-240 859, Price codes: A07 in paper copy, A01 in microfiche. Report No. EPA-440/1-74-019-D, March 1974. 150 p. 17 fig, 10 tab, 11 ref.

Descriptors: *Industrial wastes, *Aluminum, *Standards, *Technology, *Effluents, Capital costs, Operating costs, Pollution abatement, Water pollution control, Federal Water Pollution Control Act, Economic impact, Water reuse, Wastes water treatment, Industries.
Identifiers: *Effluent guidelines, Primary aluminum smelting.

Effluent limitation guidelines and standards of performance for the primary aluminum smelting industry to be achieved by July 1, 1977 and July 1, 1983 were developed. The best practicable control technology currently available (BPCTCA) is treatment of wet scrubber water and other effluents to precipitate the fluorides, to decrease the concentration of suspended solids, and to allow recycling of the treated water. Further lime treatment of bleed streams and filtrates constitutes the best available technology economically achievable. The best available demonstrated control technology consists of dry scrubbing of potline air and the control and treatment of other fluoride-containing waste streams by recycling and treatment of bleed streams by lime precipitation. Approximately one-third of the 31 primary aluminum plants have met the 1977 guidelines. The remainder of the industry can achieve these standards by application of the BPCTCA at an estimated capital investment of about $10/annual metric ton and an increased operating cost of about $4.6/metric ton. It is estimated that an additional investment of $3.8/annual metric ton and an operating cost of $1.13/metric ton would be required to decrease pollutant discharges to the 1983 level. (Luedtke-Wisconsin)

ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES FOR SEAFOOD PROCESSING INDUSTRY: (FISH MEAL, SALMON, BOTTOM FISH, CLAMS, OYSTERS, SARDINES, SCALLOPS, HERRING, ABALONE),
Development Planning and Research Associates, Inc., Manhattan, Kans.
D. L. Jordening, and T. R. Eystone.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-247 307, Price codes: A09 in paper copy, A01 in microfiche. Report No. EPA-230/2-74-047, October 1975. 180 p. 80 tab. 68-01-1533

Descriptors: *Economic impact, *Standards, *Water pollution control, *Effluents, *Food processing industry, Clams, Oysters, Salmon, Bottom fish, Industrial wastes, Industrial plants, Industrial production, Social impact, Employment, Prices, Pricing, Costs, Profits, Investment, Herrings, Pollution abatement, Foreign trade.
Identifiers: *Seafood processing industry, *Effluent guidelines, Fish meal, Menhaden, Anchovy, Sardines, Scallops, Abalone, Plant closures.

This study supplements the EPA Effluent Limitation Guidelines analysis for seafood processing industry by estimating the broader economic effects of the application of required pollution control technology. The seafood industry is characterized by a large number of small plants (726), decreases in the number of plants over time, and important competition from foreign producers. Economies of scale exist, both in processing and in effluent treatment. Opportunities to pass on total increased costs of $5,541,000 for BPT Standards and $11,157,000 for BPT plus BAT standards are limited because of the intense competitiveness of the industry. Plant closure impacts are expected to be greatest in the Alaskan salmon industry, nonmechanized bottom fish processing and clam processing, and the West Coast oyster industry. It is estimated that meeting BPT guidelines would close 42 plants and complying with BAT guidelines would close an additional 86 plants. Production impacts would be minimal since most of the closures would be small plants and the remaining plants have excess capacity. Good reemployment opportunities exist within the industry and net unemployment from BPT is estimated at 190 or 510 from BPT plus BAT. New Source Performance Standards will not curtail new investment in the industry. (Luedtke-Wisconsin)
W77-02433

ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES: BEET SUGAR INDUSTRY,
Development Planning and Research Associates, Inc., Manhattan, Kans.
M. L. David, R. J. Buzenberg, and C. C. Jones.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 844, Price codes: A07 in paper copy, A01 in microfiche. Report No. EPA 230/2-75-002, August 1975. 128 p. 5 fig., 35 tab. 68-01-1533.

Descriptors: *Economic impact, *Standards, *Water pollution control, *Effluents, Prices, Employment, Costs, Social impact, Industrial production, Foreign trade, Industrial wastes, Pollution abatement, Industrial plants, Pricing, Profits.
Identifiers: *Beet sugar industry, *Effluent guidelines, Zero discharge, Plant closures.

This study supplements the EPA Effluent Limitation Guidelines analysis for the beet sugar industry by estimating the broader economic effects of the application of certain of these control technologies. Following a description of the number, types, size, and location of plants, financial profiles of representative model plants, pricing practices, and supply/demand relationships in the industry, pollution control costs are superimposed on the model plant financial profiles to analyze microeconomic effects such as unit cost increments, price increases, and potential closures. The macroanalysis effects on employment, communities, and foreign trade are also evaluated. Imposition of effluent limitation standards is not expected to raise prices because large portions of industry are already at or very near zero discharge levels. Potential closures due to imposition of zero discharge standards are estimated to be 7 to 17 plants representing between 8% and 26% of beet sugar production. A discharge standard of .5 pounds of BOD in 1977 is estimated to cause 4 to 10 plant closures. New plants are expected to come on line to offset nearly all of these potential closures. While employment effects are expected to be minimal, the effects on a given community could be greater due to the loss of growers, since each plant represents about 300 growers. (Luedtke-Wisconsin)

REMOVAL BENEFITS: IT CAN BE TOO COSTLY,
Kansas City Water Dept., Mo.
D. R. Boyd, J. R. Popalisky, J. D. Reece, and D. McMurtrey.
Water and Waste Engineering, Vol. 13, No. 2, p 42-44, 1976. 4 fig.

Descriptors: *Analytical techniques, *Organoleptic properties, *Nutrient removal, *Waste water treatment, *Water treatment, Missouri River, Agricultural runoff, Treatment facilities, Comparative benefits.
Identifiers: Non-point pollution sources, Kansas City(Mo).

The case against requiring complete nutrient removal at sewage treatment facilities discharging into the Missouri River with particular reference to Kansas City, Missouri, is described. Based on current minimum flows for the Missouri River, the quantity of the effluent discharged from Kansas City, never exceeds 1% of the river's flow. Ninety-five percent of the sewage is discharged directly into the river after primary treatment, while the remainder undergoes secondary treatment before being discharged. In addition, land use in the drainage area is predominantly agricultural and produces much nutrient enrichment in the form of decayed matter, animal wastes, and fertilizers. Because of these factors, sewage wastes from point sources are of comparatively minor significance and advanced waste treatment facilities at Kansas City would have an insignificant effect on the water quality in the receiving stream. The incidence of organoleptic properties in the Kansas City's water supply generated an analytical procedure for determining the relative amounts and general classification of the agricultural problem organics. The procedure involves sample concentration followed by detection using gas chromatography and infrared spectrometry. A schematic diagram represents the procedure. The method is used as an integral part of the water treatment plant's daily operation and was the basis for plant modification to remove turbidity and organics. (Luedtke-Wisconsin)

KINETICS OF THE ACTIVATED CARBON-STEAM REACTION,
Connecticut Univ., Storrs. Dept. of Chemical Engineering.
H. E. Klei, J. Sahagian, and D. W. Sundstrom.
Industrial and Engineering Chemistry, Process Design and Development, Vol 14, p 470, October 1975. 5 fig, 1 tab, 12 ref. OWRT A-045-CONN(2), 14-31-0001-3807.

Descriptors: *Activated carbon, *Kinetics, *Waste water treatment, *Water pollution, Adsorption, Heat transfer.
Identifiers: *Thermal regeneration, *Carbon-steam reaction, Gas-flow rate, External mass transfer rate.

A bed of activated carbon was reacted with steam at temperatures between 1400 and 1500F and steam concentrations between 10.7 and 53.4 mol % to determine the kinetic rate equations which predict the reaction rate. In addition, since activated carbon is a porous solid, the effect of gas flow rate through the bed was studied to see if mass transfer was important. The reaction rate was found to vary with the 0.58 power on the steam concentration with an activation energy of 63.6 kcal/g-mol. The gas rate did have some effect on the reaction rate but it appeared not to be sufficient to shift the controlling step to mass transfer. (de Lara-Connecticut)

REMOVAL OF ALGAE FROM FLORIDA LAKES BY MAGNETIC FILTRATION,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
G. Bitton, J. L. Fox, and H. G. Strickland.
Applied Microbiology, Vol. 30, No. 6, p 905-908, December 1975. 2 fig, 3 tab, 16 ref. OWRT A-030-FLA(1). 14-31-0001-5009.

Descriptors: *Viruses, Filtration, *Florida, Lakes, Waste water treatment, Algae, Hydrogen ion concentration.
Identifiers: *Magnetic filtration.

Magnetic filtration was used for the removal of algal populations present in five lakes located in the vicinity of Gainesville, Florida. It was found that the use of this technique enabled a good removal (94%) of algal cells from three lakes where the pH was around 7. The other two lakes, with a higher pH, displayed a lower removal. However, the treatment was greatly improved by lowering the pH from 9.5 to 6.5. (Morgan-Florida)

FACTORS AFFECTING THE ADSORPTION OF POLIO VIRUS TO MAGNETITE IN WATER AND WASTEWATER,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
G. Bitton, O. Pancorbo, and G. E. Gifford.
Water Research, Vol. 10, p 978-980, 1976. 5 fig, 7 tab, 22 ref. OWRT A-030-FLA(2). 14-31-0001-5009. 14-34-0001-6010.

Descriptors: *Viruses, *Filtration, Adsorption, *Waste water treatment.
Identifiers: *Magnetic filtration, *Polio virus, *Magnetite, *Virus removal.

The process of magnetic filtration involves the use of magnetite for the removal of various pollutants from water and wastewater. A study was undertaken to investigate the interaction between magnetite and polio virus. It was found that the adsorption process was enhanced by the presence of cations, conformed to the Freundich isotherm, and did not vary significantly when the pH was varied from 5 to 9. The influence of two wastewater effluents on the adsorption process was also studied and their interference with the adsorption of polio virus to magnetite is discussed. (Morgan-Florida)

USE OF WASTE HEAT FOR SOIL WARMING IN NORTH CAROLINA,
North Carolina State Univ., Raleigh. Dept. of Biological and Agricultural Engineering.
R. W. Skaggs, D. C. Sanders, and C. R. Willey.
Reprint from Transactions of the ASAE, Vol. 19, No. 1, p. 159-167, 1976. OWRT A-060-NC(4). 14-31-0001-3833.

Descriptors: *Heat transfer, Surface irrigation, Subsurface irrigation, *Cooling water, *Heated water, Soil temperature, Southeast U.S., Horticultural crops, Electric power, Thermal pollution, *North Carolina.
Identifiers: *Soil warming, *Waste heat.

In field experiments conducted to evaluate the use of waste heat for soil warming in the Southeast, water was heated to 37.7C and circulated through a network of underground plastic pipes. Soil temperature and heat flux measurements were analyzed to determine the effect of soil warming in combination with surface and subsurface irrigation on the soil temperature regime and on the amount of heat that can be transferred to the soil system. It was determined that heat could be transferred to the soil system at rates ranging from 37.5 w/m2 during hot periods to greater than 138 w/m2 during cold periods. Soil warming increases surface temperatures sufficient to stimulate plant growth during cool seasons of the year. However, the temperature rise due to soil warming is somewhat less in hot periods. A mathematical model developed by Kendrick and Havens (1973) was used to extrapolate the information obtained in this study to prototype scale systems. It was determined from heat flux data that for hot summer days the effective surface temperature, approximately 6500 ha would be required to handle the waste heat from a 1000 megawatt plant if the soil warming system consists of 10 cm pipe buried 50 cm deep and placed 50 cm apart. If low volume sprinkler irrigation is used in combination with sub-surface irrigation, the effective surface temperature can be reduced to 27C and about 4900 ha would be required. Based on these projections and on an economic analysis of a soil warming system by Plummer (1974), it was concluded that soil warming systems will not be economically competitive with conventional cooling methods in N. C. at the present time. (Kiger-North Carolina)

SPRAY IRRIGATION OF WASTE WATER ON CITRUS GROVES,
Agricultural Research and Education Center, Lake Alfred, Fla.

WATER RESOURCES SCIENTIFIC INFORMATION CENTER U. S. DEPT. OF THE INTERIOR WASHINGTON, D. C. 20240

R. C. J. Koo.
Reprint from Transactions of the 1976 Citrus Engineering Conference, American Society of Mechanical Engineers, Florida Section, Vol XXII, March 25, 1976. 14 p, 5 fig, 6 tab, 10 ref. OWRT A-016-FLA(1). 14-31-0001-3809.

Descriptors: *Citrus, Irrigation, Nutrients, Water pollution, Fruit crops, *Spray irrigation, *Water reuse.

Spray irrigation is widely used to dispose of the waste water from citrus processing plants. The citrus processing season in Florida may range from 6 to 10 months a year depending on the size and the type of the fruit crop. Much of this season occurs in that part of the year when rainfall is deficient. It would be advantageous if this waste water could be utilized in the production of citrus crops. A study was conducted between 1971 and 1974 to investigate the feasibility of growing citrus with citrus processing waste water. Design criteria and operational methods of spray irrigation with citrus processing waste water under Florida conditions have been reported by Morrell. Tree performance and certain horticultural considerations of spray irrigation of citrus with processing waste water are investigated. (Morgan-Florida)

RISK-SAFETY FACTOR RELATION FOR STORM SEWER DESIGN,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
B. C. Yen, and W. H. Tang.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol. 102, No. EE2, p 509-516, April, 1976. 3 fig, 1 tab, 9 ref, 2 append. OWRT C-4123(No. 9023) (7).

Descriptors: *Sewers, *Design criteria, *Risks, *Safety factors, *Storm drains, *Network design, *Pipes, Slopes, Equations, Rainfall intensity, Watersheds(Basins), Discharge(Water), Curves, Waste water treatment.
Identifiers: *Storm sewers, Pipe diameter, Sewer capacity.

A new method has been proposed for optimal design of diameters and slopes of pipes of storm sewer networks. The basic equations involved are introduced. The four parameters contributing to the uncertainty in the sewer capacity are evaluated. This uncertainty results from uncertainties in hydraulic radius, resistance coefficient, slope, and equation error. The uncertainty of rainfall intensity varies with the design return period and the duration of the rainfall and the location and size of the drainage basin. A 10-acre drainage basin at Urbana, Illinois is considered as an example. The uncertainties in runoff coefficient, area, and equation error must also be known to determine the uncertainty in design discharge. A risk-safety factor curve can be constructed by calculating corresponding risks and safety factors for various pipe sizes with other conditions unchanged, and repeating the procedure for a different duration. Different curves should be used for different locations, because spatial variations of rainfall and surface slope will cause the curves to vary. (Snyder-FIRL)

THE ROLE OF SOLAR ULTRAVIOLET RADIATION IN 'NATURAL' WATER PURIFICATION,
Kentucky Univ., Lexington. Dept. of Radiation Medicine.
J. Calkins, J. D. Buckles, and J. R. Moeller.
Photochemistry and Photobiology, Vol. 24, No. 1, p 49-57, July, 1976. 7 fig, 2 tab, 24 ref. OWRT A-064-KY(1).

Descriptors: *Water purification, *Coliforms, *Solar radiation, *Waste water treatment, *Tertiary treatment, Lagoons, Bacteria, Bactericides, Microorganisms, Mortality, Monitoring, E. coli.

The effect of solar ultraviolet radiation on natural water purification was investigated by monitoring the concentration of Escherichia coli in the input and output of a tertiary waste water system (four lagoons) over an 11-month period and by measuring the integrated flux of biologically active solar ultraviolet radiation. A comparison of the die-off expected from solar ultraviolet exposure to the actual die-off observed for different batches of water was obtained by also determining the effective temperature of the system, the growth rate of Escherichia coli at the effective temperature, the penetration of solar ultraviolet radiation into the lagoons, the dose-response relation for the killing of Escherichia coli by ultraviolet radiation, and the retention time of water in the system. The observed killing of Escherichia coli was quite close to the values calculated, and solar ultraviolet radiation appears to be a very important factor in the natural purification of water. HYPERFILTRATION FOR RENOVATION OF TEXTILE FINISHING PLANT WASTEWATER,
La France Industries, S. C.
C. A. Brandon, and J. J. Porter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 188, Price codes: A08 in paper copy, A01 in microfiche. Report EPA-600/2-76-060, March 1976, 157 p, 15 fig, 8 ref, 23 tab, 3 append.

Descriptors: *Textiles, *Waste water treatment, *Water reuse, Wastes, Industrial wastes, Water pollution sources, Waste treatment, Dyes, Membrane processes, Costs, Water conservation, *Recycling, *Filtration, Waste water(Pollution), Water pollution treatment, Water pollution control.
Identifiers: *Hyperfiltration.

Experimental studies show that waste water from a textile dyeing and finishing operation can be recycled. The waste water was run through a set of hyperfiltration membranes, which separated it into purified water and a concentrated dye residue fraction. Over a 15-month period, up to 90% of the waste water was recovered and used as the normal supply in all parts of the dyeing operation. The concentrated dye residue can also be used to dye fabric. The cost of recycling the waste water was projected to be $0.121/cu m of waste water. However, reusing the waste water results in savings of $0.234/cu m, due to savings in water, chemicals, and energy. (Witt-IPC)

Identifiers: *Kraft mills, Recovery furnaces, Hydrogen chloride, Flue gases, Gas scrubbing.

One possible way to reduce the discharge of water pollutants from kraft pulp bleaching is to recycle effluent streams from the bleach plant to the recovery system. This raises questions concerning the effects of increased chloride levels in the liquor cycle and the removal of chloride from the recovery system. The distribution of chlorides between the smelt and the gas phase in the recovery furnace has been determined in mill trials and correlated with a theoretical chemical process model. The reaction equation given can be used to convert NaCl in the flue gas dust (fly ash) from the recovery furnace into gaseous HCl. The HCl produced can be removed by scrubbing the flue gas with water. Melting point data for chloride-containing smelts were determined by laboratory studies on the model system NACL-sodium carbonate-sodium sulfide. The implications of these studies on the operating conditions of the recovery furnace are discussed. (See also W77-02560) (Witt-IPC)

TAPPI/CPPA International Pulp Bleaching Conference, Chicago, May 2-6, 1976, Preprinted Proceedings (TAPPI, Atlanta, GA.), p 19-25. 9 fig, 29 ref, 3 tab.

Descriptors: *Bleaching wastes, *Water reuse, Wastes, Industrial wastes, Water pollution sources, *Recycling, *Chlorides, Corrosion, Steel, Alloys, Water pollution control, Closed systems, Effluents, Pulp and paper industry, Pollution abatement, Titanium, Oxygen.
Identifiers: *Kraft mills, Bleach plants, Delignification, Oxygen bleaching, Chlorine dioxide, Closed systems.

Recycling bleach plant effluent to the recovery system reduces the amount of water pollutants from a bleached kraft pulp mill. Several methods of removing chlorides from a mill with a closed bleachery are under development. Extended delignification in the cook, oxygen bleaching, and the use of a high proportion of chlorine dioxide during bleaching will help to keep chloride levels low. Chloride concentrations of 20-30 g NaCl/liter of white liquor have a slightly negative effect on pulp (this may be offset by increasing the sulfidity) but show no adverse effects on bleached pulp strength or brightness stability. Increases in recovery system corrosion are indicated. Only highly alloyed steels with a molybdenum content of more than 4% show fair stability in the first bleach stage; however, only titanium can be used with certainty in this corrosive environment. High-grade alloys must be used elsewhere in the bleach plant. (See also W77-02559) (Witt-IPC)

EFFLUENT-FREE BLEACHED KRAFT PULP MILL. VIII. BLEACH PLANT RENOVATION AND DESIGN,
Erco Envirotech Ltd., Toronto (Ontario).
D. W. Reeve, G. Rowlandson, and W. H. Rapson.
TAPPI/CPPA International Pulp Bleaching Conference, Chicago, May 2-6, 1976, Preprinted Proceedings (TAPPI, Atlanta, Ga.), p 117-125. 5 fig, 14 ref.

Descriptors: *Bleaching wastes, *Water reuse, Pollution abatement, Effluents, Wastes, Industrial wastes, Pulp wastes, Water pollution sources, *Recycling, *Design, Temperature, Chlorine, Water pollution control, Reclaimed water, Water conservation, Pulp and paper industry.
Identifiers: *Kraft mills, Bleach plants, Countercurrent washing, Pulp washing, Chlorine dioxide, Sodium hypochlorite.

Renovation programs in two existing kraft mills demonstrate that increased water reuse and recycle within conventional bleach plants can reduce steam and fresh water consumption and effluent volume. Recycle of the chlorination filtrate increases the temperature of the first stage, and with proper automatic control can result in substantial chemical savings with no loss in pulp strength or quality. Substantial steam savings result from implementation of complete countercurrent washing in both CEDED and CEHDED bleach plants. Several design features are recommended to prevent increased chemical consumption. The design for new kraft bleach plants incorporated not only chlorination filtrate recycle and complete countercurrent washing, but many other steam and water saving features. Fresh water addition to seal tanks, for pulp doctoring, and pump glands is minimized. All the oxidizing chemical required in the 70/30 D/C-EDED bleach plant, as chlorine dioxide, chlorine, and NaOCl, can be supplied by the chlorine dioxide generator, eliminating use of gaseous chlorine and minimizing water input. Seal tanks are specially designed to prevent foaming. Kraft bleach plants can be designed and operated so that only 4,000 U.S. gallons total filtrate is produced per ton of pulp. Filtrates from the first and second stages are used separately, in brown stock washing and in preparation of cooking liquor. All the bleach plant filtrate can be recovered and the last major source of water pollution from bleached kraft pulp mills eliminated. (See also W76-11382; W74-07379 and W74-05275) (Witt-IPC)

INVESTIGATIONS OF EFFLUENT CHARACTERISTICS FROM CONVENTIONAL AND OXYGEN BLEACHING SEQUENCES: RESULTS OF LABORATORY STUDIES,
National Council of the Pulp and Paper Industry for Air and Stream Improvement, Inc., Gainesville, Fla.
W. L. Carpenter, W. T. McKean, H. F. Berger, and I. Gellman.
TAPPI/CPPA International Pulp Bleaching Conference, Chicago, May 2-6, 1976, Preprinted Proceedings (TAPPI, Atlanta, Ga.), p 111-115. 18 ref, 5 tab.

Descriptors: *Bleaching wastes, Effluents, Wastes, Industrial wastes, Water pollution sources, Softwood, Hardwood, Color, Biochemical oxygen demand, Chemical oxygen demand, Chlorides, *Waste water treatment, Water pollution treatment, Aeration, Oxidation lagoons, Waste treatment, Pulp and paper industry, Pollution abatement.
Identifiers: *Oxygen bleaching, Kraft pulps, Sulfite pulps.

Effluents from the laboratory bleaching of kraft softwood, hardwood, and sulfite pulps by conventional sequences (CEHDED and CEH) and by oxygen sequences (OCEDED, OCED, COD, CODED, and D/COD) are compared. The reductions in color, BOD, chemical oxygen demand, chloride, and total, volatile, and fixed solids were 99, 39, 89, 51, 74, 60, and 87%, respectively, on switching from CEH to OC sequences. Reductions were 60, 50, 33, 62, 0, 24, and 0%, respectively, using a CO sequence. Information on laboratory bleaching conditions employed is detailed, including temperature, time, pulp consistency, chemical charge, oxygen pressure, and volume of wash water. Data on final pulp brightness and kappa-number are presented. Laboratory studies on treatment of the effluents in an aerated stabilization basin are described, showing reductions in BOD of 90% with 4 days aeration. (Witt-IPC)

NEW BIOLOGICAL CLARIFIER OF THE WIESLOCH PAPER MILL OF HOLFELDER-WERKE GMBH. UND CO. KG. (NEUE BIOLOGISCHE KLAERANLAGE DER PAPIER-FABRIK WIESLOCH DER HOLFELDER-WERKE GMBH UND CO. KG.),
H. L. Dalpke.
Wochenblatt fuer Papierfabrikation, Vol. 104, No. 18, p 701, 703, September 30, 1976. 2 illus.

Descriptors: *Pulp wastes, *Waste water treatment, *Biological treatment, Wastes, Waste treatment, Industrial wastes, Water pollution treatment, Water pollution sources, Biochemical oxygen demand, Chemical oxygen demand, Foreign countries, Europe.
Identifiers: Germany.

A brief description is given of a new biological clarifier installation, using the two-stage Attisholz process. BOD was reduced from 1200 mg to 10 mg oxygen/liter. Corresponding values for COD were 1800 and 100, respectively. (Ward-IPC)
W77-02566

NEW CLARIFIER INSTALLATION FOR ALBBRUCK PAPER MILL (NEUE KLAERANLAGE DER PAPIERFABRIK ALBBRUCK).
Wochenblatt fuer Papierfabrikation, Vol. 104, No. 17, p 663, 665, September 15, 1976. 5 fig, 1 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Water pollution control, Water pollution sources, Neutralization, Flocculation, Sludge treatment, Dewatering, Sludge disposal, Pulp and paper industry, Europe.
Identifiers: Rhine River(Germany), White water(Paper machines), Germany.

The mill's new effluent treatment system (for white water from 5 fine-paper machines and one coating machine) is briefly described. The system includes neutralization, sludge-contact-flocculation, sludge-thickening, and sludge-dewatering stages. The clarified water has a maximum solids content of 20 g/liter and is discharged into the Rhine River. The dewatered sludge is suitable for dumping. (Speckhard-IPC)

TREATMENT OF PAPERMAKING EFFLUENTS (TRAITEMENT D'EFFLUENTS DE PAPETERIES),
Pulp and Paper Research Inst. of Canada, Pointe Claire (Quebec).
A. Wong, S. Prahacs, and J. Dorica.
French Patent No. 2,252,301, June 20, 1975. 16 p. 2 claims.

Descriptors: *Pulp wastes, *Waste water treatment, *Activated carbon, *Patents, Wastes, Industrial wastes, Water pollution treatment, Water pollution control, Waste treatment, Coagulation, Flocculating, Sludge, Flotation, Centrifugation, Fly ash, Coals, Aeration.
Identifiers: Charcoal, Wood.

A process for purifying waste waters such as papermaking effluents involves the following operations: finely divided activated carbon is added to the waste water to form a suspension, an oxygen-containing gas (e.g., air) is passed through the suspension, a coagulating or flocculating agent or polyelectrolyte is added to form a sludge, and the sludge is separated by decantation, flotation, or centrifugation. In particular, the finely divided activated carbon has a specific surface of 100-1800 sq m/g and is derived from fly ash, wood carbonization residue, green liquor mud, wood charcoal, and/or bone coal. U. OF I. URBANA-CHAMPAIGN

Capital costs, Operating costs, Cost, Operation and maintenance, Sampling, Water analysis, Municipal wastes, Equipment, Water purification, Water pollution treatment.
Identifiers: *Rotating biological contactor.

The RBC process for secondary biological treatment of domestic waste waters and industrial effluents involves the use of large-diameter plastic media mounted on a horizontal shaft which rotates slowly in a concrete tank while about 40% of its surface area is submerged. The resulting accumulation of biomass in layers 1-4 mm thick, equivalent to 50,000-100,000 mg/liter suspended solids, permits intensive purification within fairly short retention times. This monograph deals with the history and development of the RBC process, the basic design and operating parameters of the contactor, and practical experience with its operation. In 10 chapters, the author discusses a wealth of details, such as the early trickling filter (fundamentals, history, problems, capital and operating costs); RBC system designs for domestic wastewater treatment and for treating various industrial wastes (such as pulp and paper mill discharges); the upgrading of existing treatment facilities (primary, trickling-filter, activated-sludge, and lagoon installations); equipment configurations and plant operation (startup, problem areas, maintenance, wastewater sampling and analysis); capital and operating costs (power consumption, comparison with activated sludge and other secondary treatment processes); and possible future developments. A subject index is appended, and literature citations are given after each chapter. (Brown-IPC)

CARPET AND RUG INDUSTRY CASE STUDY I: WATER AND WASTEWATER TREATMENT PLANT OPERATION,
Georgia State Univ., Atlanta.
P. E. Gaffney.
Journal Water Pollution Control Federation, Vol. 48, No. 11, p 2590-2598, November, 1976. 7 ref, 7 tab.

Descriptors: *Textiles, *Water pollution sources, *Water treatment, *Waste water treatment, Georgia, Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Operation and maintenance, Wastes, Industrial wastes, Treatment facilities, Polychlorinated biphenyls, Organic compounds.
Identifiers: Carpets, Rugs, Coosa River(Georgia), Chlorobenzenes, Halocarbons.

An investigation was conducted on water supplies and municipal waste waters in three northwest Georgia cities situated in the Coosa River basin. Streams and sewers receive significant discharges of textile (carpet and rug) processing chemicals. Determination was made of the concentrations of biphenyl, chlorobiphenyl, chlorobenzenes, and other substances at three water and four waste water treatment facilities in conjunction with other data (BOD, COD, suspended solids) relating to plant operation and performance. Two waste treatment plants were experiencing operating difficulties which may be related to the presence of textile-processing chemicals or substances formed after chlorination such as chlorobiphenyls or polychlorinated biphenyls. (Witt-IPC)

Khimicheskaya Tekhnologiya, Vol. 87, No.3, p 47-48, May/June, 1976. 2 fig, 4 ref, 1 tab.

Descriptors: *Sludge disposal, *Dewatering, *Pulp wastes, *Cellulose, Filtration, Polymers, Aluminum, Sulfates, Water pollution sources, Wastes, Industrial wastes, Drainage, Waste disposal, Mixing, Sludge, Solid wastes, Water pollution control, Textiles.
Identifiers: *Viscose, Waste paper, Paper machines, Polyacrylamide, Polyethylene oxide.

After a discussion of the disadvantages of known methods (notably sludge accumulators, drainage beds, or centrifugation) for dewatering and disposal of sludges produced in the maufacture of viscose, the authors report results of experiments designed for dewatering blends of waste paper pulp plus cellulosic sludge by filtration on a paperboard machine at various degrees of freeness. Optimum freeness for the blend was determined to be between 25 and 40 Schopper-Riegler. The influence of drainage aids, viz., polyacrylamide (PAA), aluminum sulfate, and polyethylene oxide (PEO) on the freeness degree was also evaluated, with the following results: addition of 1.5% aluminum sulfate or 0.05% PAA (dry-weight basis) assures the effective lowering of the beating degree. However, the addition of 0.3-0.8% PEO (dry-weight basis) produced the best results and lowered the beating degree to a greater extent than did the other two coagulants added in optimal concentrations. Based on these findings, it is suggested that dehydration of a blend of waste paper pulp and cellulosic sludge obtained from the production of viscose can be carried out effectively on industrial board machines, provided the optimum ratio of components is maintained, preferably 3 parts waste paper pulp per part of cellulosic sludge. (Sykes-IPC)

5E. Ultimate Disposal Of Wastes

THE DESIGN AND CONSTRUCTION OF A SCREENING AND PUMPING STATION AND AN OUTFALL FOR THE DISPOSAL OF SEWAGE FROM BRIGHTON AND HOVE,
J. D. C. Osorio.
The Public Health Engineer, Vol 4, No 5, p 131-137, September, 1976. 4 fig, 6 ref.

Descriptors: *Pumping plants, *Screens, *Outlets, *Sewage disposal, *Treatment facilities, Equipment, Construction, Design criteria, Liquid wastes, Suspended solids, Waste water treatment, Waste disposal, Flow, Hydraulics, Municipal wastes.

Design and construction details of a screening and pumping station and an outfall for the disposal of sewage from Brighton and Hove (Great Britain) are described. The general scheme involves: an outfall long enough to ensure that sewage cannot reach the beach areas of the above communities until dilution and action of the sea water on sewage bacteria have reduced pollution to an acceptable level, pumps to allow the intercepting sewer to discharge freely at all times, and screens and ancillary equipment for the removal of sewage solids. The pumping and screening plant is designed for a 4000-liters/sec flow, and the outfall and diffuser system is designed to accept 6800 liters/sec, six times the anticipated average dry-weather flow. The screening plant should be capable of handling 2500 kg of dry solids/day. Screenings are removed from the fine screens by water jets, and grit removal from tanks is by chain and bucket scrapers. The outfall tunnel is 2.3 meters in internal diameter and 1830 meters long and is lined with Kinnear Moodie Rapid smooth bore segments. infiltration of groundwater is controlled by injecting rapid hardening cement grout through holes drilled ahead of the face. (Kreager-FIRL)

DILUTION AND DESIGN,
Water Pollution Research Lab., Stevenage (England).
A. R. Agg.
Water and Waste Treatment, Vol 19, No 7, p 33, July, 1976. 2 fig, 1 ref.

Descriptors: *Outlets, *Design criteria, *Waste water disposal, *Conveyance structures, *Hydraulic structures, Mathematical models, Sewage disposal, Industrial wastes, Liquid wastes, Waste disposal.

A method for designing outfalls for the discharge of sewage or industrial wastes to the sea is described which is based primarily on initial dilution and the transit times from the outfall to the area of concern. The design procedure assumes a demand for very high initial dilution factors if the release is close to the beach and progressively lower demand factors as the outfall is extended offshore. The design length for the outfall is given by the intersection of a curve for the dilution which can be attained with the flow of sewage and depths of water with a curve representing the demand for dilution. Calculations based on the above design procedure indicate that a system with 10 outfalls reduces the length of the outfall required by about 50%. (Kreager-FIRL)

OCEAN DUMPING PHASE-OUT IN EPA REGION II,
S. J. Hadeed.
Journal Water Pollution Control Federation, Vol. 48, No. 10, p 2246-2248, October, 1976.

Descriptors: *Sewage sludge, *Sludge disposal, *Oceans, *Legislation, *Coasts, Legal aspects, Monitoring, Cities, Waste disposal, New York, New Jersey.
Identifiers: Land application, Composting, Pyrolysis.

Environmental Protection Agency plans for phasing out ocean dumping of sewage sludge in Region II are described. Provisions to end ocean dumping by December 31, 1981 will be written into the interim dumping permits which will also prohibit nighttime dumping and recommend an expanded monitoring program. A comprehensive study of land-based alternatives to ocean dumping in Region II contracted by the Environmental Protection Agency indicates that air pollution rules must be waived in the New York and New Jersey metropolitan areas and recommends that regional pyrolysis facilities be constructed in the New York-New Jersey area. Land application or composting is recommended for sludge produced in outlying areas. Senate bill S 3147 which extends the Marine Protection, Research and Sanctuaries Act through fiscal 1977 appropriates $4.8 million for ocean dumping regulation, $5.6 million for ocean dumping research, and $0.5 million for marine sanctuaries. It also requires that the Secretary of the Army, Coast Guard, and Administrator of the Environmental Protection Agency submit annual reports on their respective activities in carrying out the ocean dumping title of the Act. (Kreager-FIRL)

GAS AND LEACHATE FROM LANDFILLS: FORMATION, COLLECTION, AND TREATMENT. PROCEEDINGS OF A RESEARCH SYMPOSIUM.
Municipal Environmental Research Lab., Cincinnati, Ohio.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 161, Price codes: A09 in paper copy, A01 in microfice, Report EPA-600/9-76-004, Edited by E. J. Genetelli and J. Cirello. Held at New Brunswick, N. J., March 25-26, 1975, Published March 1976. 196 p. 104 fig, 47 tab, 102 ref.

Descriptors: *Landfills, *Leachate, *Gases, *Waste disposal, *Solid wastes, Soil types, Migration, Attenuation, Monitoring, Analytical techniques, Research priorities, Toxicity, Hazards, Liners, Recycling, Sludge, Clay minerals, Soil mechanics, Groundwater, Water pollution, Organic compounds.

Topics dealing with the formation, collection, and treatment of gas and leachate from landfills are presented. Specific subjects discussed include: current Environmental Protection Agency activities in solid waste management research; solid waste management research in New York State, Puerto Rico, and the United Kingdom; a theoretical analysis of gas movement through soils; analytical methodologies for leachate and gas analysis; leachate attenuation in undisturbed and remoulded soils; variations in gas and leachate production from baled and non-baled municipal refuse; gas and leachate generation in various solid waste environments; leachate migration through selected clays; the pollution of groundwater by organic compounds generated by landfill activities; attenuation mechanisms of pollutants through soils; the monitoring of toxic chemicals at land disposal sites; an assessment of synthetic and admixed materials for lining landfills; landfill management with leachate recycle and treatment; the effect of shredding and sludge addition on solid waste decomposition; and a case history of landfill gas movement through soils. (See also W77-02395 thru W77-02413) (Kreager-FIRL)
W77-02394

INTRODUCTION TO SYMPOSIUM ON GAS AND LEACHATE FROM LANDFILLS: FORMATION, COLLECTION, AND TREATMENT,
Rutgers - The State Univ., New Brunswick, Dept. of Environmental Science.
A. J. Kaplovsky.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 1-2.

Descriptors: *Landfills, *Waste disposal, *Leachate, *Soil types, *Soilid wastes, Environmental effects, Environmental sanitation.

Problems associated with assessing the impact of solid waste disposal in landfills are discussed, with particular emphasis on the importance of considering all of the environmental interactions involved. Constituent concentrations of pollutants found during landfill investigations should be carefully qualified by reporting fully the environmental conditions under which the decomposition occurred. For example, simply reporting the constitutent level at a given distance from the source without including the type of soil or medium through which the leachate traveled, the time of transit, or vegetative cover can lead to a misrepresentation of the findings. At the current pace of new legislation and enforcement, it is especially important to appropriately identify findings and to delineate limitations on conclusions. (See also W77-02394) (Kreager-FIRL)
W77-02395

CURRENT EPA RESEARCH ACTIVITIES IN SOLID WASTE MANAGEMENT,
National Environmental Research Center, Cincinnati, Ohio.
N. B. Schomaker, and M. H. Roulier.
In: Symposium on Gas and Leachatfrom Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 3-11. 1 tab.

Descriptors: *Waste disposal, *Solid wastes, *Reclamation, *Research priorities, *Federal government, Programs, Energy conversion, Land use, Recycling, Regulation.

Environmental Protection Agency research activities dealing with the management and disposal of solid wastes are outlined. The Agency's research efforts in this area include: establishing the basis for a solid waste management regulatory program for hazardous and nonhazardous wastes; determining the human health and environmental effects resulting from the land disposal of selected substances; investigating the migration of hazardous materials through soils and in water transport; establishing the role of soil in controlling or reducing harmful substances reaching water or air; assessing technology for the control of hazardous solid wastes; and evaluating the potential of source reduction, recycling, and energy conversion of solid waste materials. (See also W77-02394) (Kreager-FIRL)

CURRENT OFFICE OF SOLID WASTE MANAGEMENT PROGRAMS - LANDFILL ACTIVITIES,
Environmental Protection Agency, Washington, D.C. Office of Solid Waste Management Programs.
T. V. DeGeare, Jr.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 12-15.

Descriptors: *Landfills, *Waste disposal, *Research priorities, *Leachate, *Gases, Federal government, Programs, Waste treatment, Solid wastes, Monitoring, On-site investigations, Toxicity, Economics, Groundwater, Soil tests, Soil mechanics, Filtration, Irrigation, Activated sludge.

Research programs currently being conducted by the Environmental Protection Agency's Office of Solid Waste Management which deal with problems related to leachate and gas generation during landfill activities are outlined. These programs include: field monitoring activities to learn about leachate generation and movement under various field conditions; an assessment of the economic impact resulting from the effect of poor waste disposal practices on ground water contamination; studies on the extent to which soil attenuation acts as a mechanism for reducing the harmful effects of leachate; an evaluation of various leachate treatment methods (anaerobic filtration, spray irrigation, activated sludge treatment); and studies on the nature of landfill-generated gas both in terms of its potential as a hazard and as an energy source. (See also W77-02394) (Kreager-FIRL)

CURRENT SOLID WASTE RESEARCH ACTIVITIES IN NEW YORK STATE,
New York State Dept. of Environmental Conservation, N. Y. Div. of Solid Waste Management.
C. N. Goddard.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 16-17.

Descriptors: *Landfills, *Leachate, *Research priorities, *Waste disposal, *Solid wastes, Monitoring, Streams, Springs, Surface waters, Flow, Analytical techniques, Water pollution, Pollutant identification, *New York, Programs.

Solid waste research being sponsored by the State of New York is described. Leachate from two landfills in the central part of the state is being extensively sampled at a series of surface sample points in springs and streams below the disposal sites to learn more about the conservative nature of various pollutants. Flow measurements are being performed in the streams to provide information on the influence of dilution. This information will then be used to select a set of leachate indices. Another project funded by the Environmental Protection Agency is being conducted concurrently with the above research to investigate various ways of detecting the presence of leachate during the daytime and at night. Various types of films and thermal scanners are being evaluated. (See also W77-02394) (Kreager-FIRL)

CURRENT SOLID WASTE MANAGEMENT ACTIVITIES IN PUERTO RICO,
Puerto Rico Environmental Quality board, San Juan.
S. Robena, Jr.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey,

U. OF I. URBANA-LIBRARY

Department of Environmental Science, Rutgers University, p 18-25. 1 fig, 2 tab, 8 ref.

Descriptors: *Solid wastes, *Waste disposal, *Landfills, *Leachate, *Research priorities, *Energy conversion, Monitoring, Pollutant identification, Reclamation, Economics, Feasibility studies, Physical properties, Chemical properties, Surveys, Information exchange, Groundwater, Toxicity, *Puerto Rico.

Research activities on solid waste management in Puerto Rico are reviewed. Studies on leachate formation at different sanitary landfill sites have been initiated in coordination with the United States Geological Survey. A long-range plan for a continuous monitoring program at solid waste disposal sites has been proposed to assess the quality of groundwater near landfill sites. Advanced resource recovery studies are being conducted to investigate the feasibility of using metropolitan solid waste as an auxiliary fuel and to evaluate existing markets for segregated solid wastes, paper, glass, and metals. Community information programs are also being conducted. An island-wide survey of industrial hazardous and toxic wastes is being performed so that a state plan for the management of these wastes can be formulated. Detailed physical and chemical data from an analysis of leachate sampled at one of the landfill sites investigated are tabulated. (See also W77-02394) (Kreager-FIRL)
W77-02399

LANDFILL RESEARCH WORK IN PROGRESS AT HARWELLS HAZARDOUS MATERIALS SERVICE,
Atomic Energy Research Establishment, Harwell (England).
J. Bromley.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 27-32.

Descriptors: *Solid wastes, *Waste disposal, *Leachate, *Landfills, *Research priorities, Reclamation, On-site investigations, Leaching, Movement, Rock properties, Chemical wastes, Toxicity.
Identifiers: *United Kingdom.

Research on solid waste management in the United Kingdom is reviewed, with particular emphasis on landfill site studies. The research activities include: the reclamation of landfill sites; the development of a data bank on potentially hazardous materials deposited into landfills; on-site investigations of different types of landfills; supporting lysimeter programs; studies on the behavior of selected toxic wastes associated with landfill leachate; studies of the movement of toxic leachate through sandstone, chalk, and gravel; experiments involving the exposure of different rock cores to synthetic leachate mixtures; studies on the relative rates at which various toxic materials are leached from actual wastes; and evaluations of encapsulation procedures for preventing the release of toxic wastes to landfills under different conditions. VARIATIONS IN GAS AND LEACHATE PRODUCTION FROM BALED AND NON-BALED MUNICIPAL REFUSE,
Systems Technology Corp., Dayton, Ohio.
M. C. Eifert.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 71-82. 10 fig, 3 tab.

Descriptors: *Leachate, *Gases, *Landfills, *Municipal wastes, *Waste disposal, Color, Conductivity, Chemical oxygen demand, Hardness(Water), Carbon, Iron, Copper, Zinc, Nickel, Chemical analysis, Solid wastes, *Pollutant identification.

Experiments involving the use of five landfill simulators filled with municipal refuse were performed to investigate gas and leachate production. Although insufficient gas was generated for analysis, leachate was collected several times. The first leachate collected appeared to be the squeezings from the solid waste during loading. Further leachates gathered reflected leachate generated from moisture additions. The experiments are still underway, and no conclusions can be drawn because of the limited amount of data thus far generated. Leachate analytical data for color, pH, conductivity, chemical oxygen demand, hardness, total organic carbon, volume, iron, copper, zinc, and nickel are tabulated. (See also W77-02394) (Kreager-FIRL)
W77-02404

GAS AND LEACHATE GENERATION IN VARIOUS SOLID WASTE ENVIRONMENTS,
Systems Technology Corp., Dayton, Ohio.
A. G. Jackson, and D. R. Streng
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 83-091. 2 fig, 5 tab.

Descriptors: *Landfills, *Leachate, *Gases, *Chemical analysis, *Microbiology, Waste disposal, Coliforms, Streptococcus, Methane, Chemical properties, Solid wastes, Simulation analysis, *Pollutant identification.

Ongoing experiments to investigate gas and leachate generation in different solid waste environments are reported. Landfill simulations with test cells containing solid waste and selected other wastes have been in progress for about 4 months. The cells are in the early stages of methane generation and have just completed the change from aerobic to anaerobic condition. Microbiological assay of the leachate revealed high levels (generally 100,000 colonies/100 milliliters) of fecal coliforms and fecal streptococcus in the initial leachate collected. Analysis of the leachates that followed revealed an increasing dieoff of coliforms in the leachate as the cell aged. Streptococcus remained quite high for several months but is now beginning to decrease. Detailed chemical data for the leachate and gas collected thus far are tabulated. ASSESSING SYNTHETIC AND ADMIXED MATERIALS FOR LINING LANDFILLS,
Matrecon, Inc., Oakland, Calif.
H. E. Haxo, Jr.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 130-158. 8 fig, 14 tab, 26 ref.

Descriptors: *Linings, *Landfills, *Leachate, *Waste disposal, *Simulation analysis, Materials, Polymers, Asphalt, Soils, Physical properties, Performance, Evaluation.

Experiments involving the use of various polymeric and admixed materials for landfill liners are reported. The liners are mounted as barriers in the bases of 24 simulated sanitary landfills which are uniformly filled with a shredded municipal refuse with a moisture content of 30%. In addition, 42 small membrane specimens are being exposed to leachate by being placed in the sand above the barriers. To date, only a soil-asphalt liner appears to be inadequate. Leachate is seeping through one specimen of this type, and indications are that a second liner of this type will also leak. Sealing the liners into the generator bases with a cast epoxy ring has worked out satisfactorily except for the soil-asphalt liner. Polyethylene film appears to be sensitive to creasing and puncturing, although it has not failed as a barrier. Laboratory tests of unexposed membrane liners of the same polymer indicate that there can be considerable liner-to-liner variation in liners of the same polymer type. These variations probably reflect differences in compounding and in fabrication of the liner materials. (See also W77-02394) (Kreager-FIRL)

SOLID WASTE DEGRADATION DUE TO SHREDDING AND SLUDGE ADDITION,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
R. K. Ham.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 168-176. 6 fig, 1 tab, 5 ref.

Descriptors: *Landfills, *Solid wastes, *Sludge, *Waste disposal, *Waste treatment, Leachate, Methane, Biological treatment, Chemical reactions, Evaluation, Performance, Odor.

Experiments investigating the effects of shredding and sludge addition on refuse decomposition in landfills are reported. The shredding of refuse promoted decomposition, resulting in rapid oxygen use and methane production as well as stabilization of leachate contaminant production. Cover prolonged the period of acidic leachate production and postponed methane production. The addition of sludge to shredded refuse resulted in odors, and a 70% water mixture was not workable. Flies were attracted to the refuse-sludge cells, whereas no flies were observed in cells without sludge. Rodent activity developed on noncompacted cells but was not observed on the compacted cells. The production of leachate per ton of dry refuse increased markedly with initial percent water and was not a strong function of compaction or depth. It appears that environmental and operational problems associated with the incorporation of sludge with refuse may negate any advantages of the process. (See also W77-02394) (Kreager-FIRL)
W77-02412

CASE HISTORY OF LANDFILL GAS MOVEMENT THROUGH SOILS,
Cook Coll., New Brnswick, N. J.
F. B. Flower.
In: Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment, March 25-26, 1975, New Brunswick, New Jersey, Department of Environmental Science, Rutgers University, p 177-189. 14 fig.

Descriptors: *Landfills, *Waste disposal, *Gases, Migration, *Phytotoxicity, Vegetation, Hazards, Solid wastes, On-site investigations, *Path of pollutants.

Three cases of landfill gas migration problems are reviewed. Each case involved the disposal of commercial refuse in old sand and gravel pits. Problems resulting from the migration of gas generated from the landfills included the death of peach trees, the death of ornamental vegetation, and the demise of commercial farm crops. One case also involved the entrance of combustible gases into private residences adjacent the landfill. The studies demonstrated that injury and death of vegetation can be used as indicators of the presence of landfill gases in the surface soil layers; however, the gases can travel laterally below vegetation without injuring it and appear at the surface at a greater distance from the landfill. The studies also demonstrated that sand and gravel pits are not good places for refuse disposal if lateral gas migration is to be prevented. If old sand and gravel pits are used as refuse, landfills, gas vents and seals should be placed at the outer edge of the landfill prior to refuse deposition. (See also W77-02394) (Kreager-FIRL)
W77-02413

AN EXPERIMENTAL HIGH-ASH PAPER MILL SLUDGE LANDFILL: SECOND ANNUAL REPORT,
Michigan State Univ., East Lansing. Div. of Engineering Research.
O. B. Andersland, W. A. Charlie, R. P. Vallee, and D. W. Marshall.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-239 618, Price codes: A11 in paper copy, A01 in microfiche. Report EPA-670/2-74-076b, December, 1974. 246 p, 58 fig, 39 ref, 83 tab.

Descriptors: *Sludge disposal, *Landfills, *Pulp wastes, Ultimate disposal, Wastes, Industrial wastes, Water pollution sources, Solid wastes, Sludge, Organic wastes, Consolidation, Soil mechanics, Soil stabilization, Waste disposal, Land forming, Leachate, Leaching, Slope stability, Slopes, Sulfates, Nitrogen, Phosphorus, Iron, Chlorides, Hardness(Water), Salts.

For the slope stability study, the experimental paper mill sludge landfill was altered by removal of one retaining dike. The landfill was excavated to form a 3:4 slope and two weeks later was trimmed to a 1:8 slope. Prior to this modification, vane shear strength and Dutch cone resistance data were obtained. Slope indicator and piezometers were installed. Laboratory work included consolidation tests on undisturbed sludge samples. It is shown that soil mechanics theory can be used to predict the stability of slopes excavated in a sludge landfill. The increase in shear strength of the sludge as a direct consequence of consolidatiion resulted in a stable 3:4 slope with small observed lateral movements. Lateral movements increased rapidly after excavation to the 1:8 slope. The low permeability of the sludge together with a decreasing rate of leachate flow associated with fill consolidation exerted a moderating effect on the quantity of leachate leaving the landfill. Leachate analyses showed that the quantities of sulfate, Kjeldahl nitrogen, phosphorus, iron, and chloride were below values cited for municipal refuse. Concentrations of mineral salts and hardness were similar to those for leachate originating in landfills of municipal refuse. (Witt-IPC)

AN EXPERIMENTAL HIGH-ASH PAPER MILL SLUDGE LANDFILL: FIRST ANNUAL REPORT,
Michigan State Univ., East Lansing. Div. of Engineering Research.
O. B. Andersland, R. P. Vallee, and T. A. Armstrong.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-239 869, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-670/2-74-076a, December, 1974. 190 p, 67 fig, 36 ref, 43 tab.

Descriptors: *Sludge disposal, *Landfills, *Pulp wastes, Ultimate disposal, Wastes, Industrial wastes, Water pollution sources, Solid wastes, Sludge, Organic wastes, Consolidation, Soil mechanics, Soil stabilization, Waste disposal, Land forming, Leachate, Mechanical engineering, Lysimeters, Leaching.

An experimental landfill for paper mill sludge rich in ash (mineral elements) was constructed and monitored to obtain engineering data essential for development of guidelines and recommendations for the design and operation of future landfills for solid paper mill wastes. The landfill consisted of two sludge layers, with sand drainage blankets, an earth dike for lateral confinement, and a natural soil cover. The landfill was instrumented for settlement, water pressure, vertical and lateral earth pressure, temperature, sludge unit weights, specific gravity, and water content. Laboratory work was also conducted. A detailed description of the field behavior of the sludge is given along with predictions based on laboratory results and soil mechanics theory. Sampling of leachate from the sludge landfill at weekly intervals and laboratory analysis according to standard methods for the examination of water and waste water provided documentation as to leachate composition. A lysimeter study showed that passage of leachate through a minimal depth of soil should render the percolate innocuous. (Witt-IPC)

C(ROWN) Z(ELLERBACH)'S SOLIDS WASTE PROBLEMS AT WAUNA ARE REDUCED BY COMPOSTING,
Crown Zellerbach Corp., Wauna, Oreg.
M. L. Wysong.
Pulp and Paper, Vol. 60, No. 10, p 112-113, September, 1976.

Descriptors: *Sludge disposal, *Pulp and paper industry, *Biodegradation, Soil amendments, Temperature, Hydrogen ion concentration, Cellulose, Aeration, Operating costs, Costs, Pulp wastes, Oregon, Solid wastes, Waste disposal, Sewage treatment, Forest management.
Identifiers: *Composting.

Composting of a mixture of primary paper mill sludge and secondary sludge obtained from a municipal sewage-treatment facility at Wauna, Oregon, was investigated by Crown Zellerbach Corp. in order to determine the feasibility of forest amendment broadcasting as an alternative to landfilling for disposal of sludge. The composting operation was evaluated by measurement of volume reduction, total weight reduction, temperature, aeration, pH, and cellulose content. Composting provided volume and weight reductions in excess of 50%. A full-scale compost operation could be run for less than $100,000/year at this mill which generates an average of 70 dry tons/day. (Sykes-IPC)

POLYELECTROLYTE PERSISTENCE IN A MUNICIPAL WATER SUPPLY,
Minnesota Univ., Minneapolis. Div. of Environmental Health.
V. Goppers, and C. P. Straub.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 502, Price codes: A02 in paper copy, A01 in microfiche. (Sept. 15, 1975). 8 p, 1 fig, 5 ref. OWRT A-029-MINN(1).

Descriptors: *Polyelectrolytes, *Municipal water, *Water supply, Polymers, Chromatography, *Water treatment, Public health, *Pollutant identification, Organic compounds.

Polyelectrolytes or polymers are compounds of high molecular weight whose structure is made up of many smaller molecules -- monomers. These compounds contain a number of functional groups with reactive double bonds. In recent years, these synthetic polymers have found increasing use in water supply as coagulant and filter aids, and in the dewatering of sludges. The thin-layer chromatograms demonstrated that: (1) the polyelectrolyte is present in finished water, (2) the polyelectrolyte in finished water appears as the polymer and as monomers, (3) the polyelectrolyte or other added chemicals (e.g., chlorine) reacted with the organic compounds in raw water forming new substances which were transferred through the various stages of water treatment to the

finished water prior to discharge to the distribution system for human consumption. The finding of the polyelectrolyte or its monomers in the finished water in itself does not necessarily constitute a health hazard. However, the presence of this material in the finished water should encourage attempts to quantify the amounts present and their distribution within the various products of water treatment, i.e., finished water, sludge, backwash waters, etc., and their effects on the recycling and recovery of water treatment sludges. With such information available, it will be possible to evaluate the potential hazard of these substances on the public health of persons consuming these waters. (Walti-Minnesota)

THE BARRIER ROLE OF WATER TREATMENT INSTALLATIONS WITH RESPECT TO CERTAIN HETEROCYCLIC COMPOUNDS, (IN RUSSIAN),
Moskovskii Gosudarstvennyi Meditsinskii Institut (I) (USSR).
A. A. Korolev, and V. P. Laskina.
Gig Sanit 8, p 15-17, 1975.

Descriptors: *Water treatment, Organic compounds, Barriers, Potable water, Treatment facilities.
Identifiers: *Morpholine, *Piperidine, *Pyridines, *Heterocyclic compounds.

Heterocyclic compounds such as morpholine and piperidine are highly resistant to physico-chemical drinking water treatment. The barrier role of the water-works installations apparently is limited in respect to other heterocyclic compounds, particularly the pyridines, due to the close relation of their physico-chemical properties to those of the investigated substances.--Copyright 1976, Biological Abstracts, Inc.

EFFECTIVENESS OF CONTINUOUS CHLORINATION OF WELL WATER BY DOSAGE CARTRIDGES IN TRANSCARPATHIA, (IN RUSSIAN),
R. I. Grishchenko.
Gig Sanit 10, p 92-93, 1975.

Descriptors: *Chlorination, *Water wells, Chlorine, Human diseases, Epidemiology, Water supply, *Disinfection, *Water treatment.
Identifiers: *Transcarpathia(USSR), Typhoid fever, USSR.

Continuous chlorination of wells by dosage cartridges maintains the level of residual Cl in the water within 0.3-0.5 mg/l and provides sufficiently effective decontamination for 28-30 days. Standard cartridges have an explicit advantage over nonstandard, since they enable calculation of the necessary quantity of Cl-active preparation and provide a uniform release of active Cl into the water. The wide use of the method of continuous chlorination of well water in localities (USSR) with a relatively high incidence of typhoid fever related epidemiologically with a well water supply can reduce the incidence considerably.--Copyright 1976, Biological Abstracts, Inc.

ANALYSIS OF STORM WATER SEEPAGE BASINS IN PENINSULAR FLORIDA,
Florida Univ., Gainesville. Dept. of Civil Engineering.
H. Rubin, J. P. Glass, and A. A. Hunt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 393, Price codes: A07 in paper copy, A01 in microfiche. Florida Water Resources Research Center, Gainesville, Publication No. 39, September 1976. 121 p, 15 fig, 62 ref, 3 append. OWRT A-028-FLA(2). 14-34-0001-6010.

Descriptors: Pit recharge, Ponding, *Artificial recharge, Groundwater recharge, Infiltration, *Seepage, Water spreading, Aquifers, *Florida, *Drainage systems, Urbanization, *Storm water, *Flood control, Pollution abatement, Design criteria.

Rapid urbanization, currently proceeding in Florida, has resulted in significant problems with regard to both flood control and pollution abatement. The objective of the study was to search for the design procedures that may improve efficiency, safety and adequacy of drainage systems in peninsular Florida. Special attention was given to possiblities of recharging groundwater aquifers with excess storm water. Through such a system, partial solution to problems of inadequate potable water supply in some areas can be achieved simply as a byproduct of flood control systems. A conceptual design framework is presented. In developing this framework, a variety of disciplines involved in the solution of urban drainage systems in peninsular Florida are considered. Comparatively high levels of groundwater in many locations require consideration of two factors relating to the ability of seepage ponds to divert surface water to the aquifer. The engineer should study the ability of the pond to seep water and he should analyze the response of the groundwater table to the seeping water. With respect to these two factors, analyses and solutions adapted for engineering application are presented.

EVALUATION OF ESTUARINE SITE DEVELOPMENT LAGOONS,
Cook Coll., New Brunswick, N.J.
G. F. Walton, G. H. Nieswand, S. J. Toth, C. W. Stillman, and J. R. Westman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 367, Price codes: A09 in paper copy, A01 in microfiche. Water Resources Research Institute, New Brunswick, New Jersey, Final Report, July 1, 1976. 167 p, 20 fig, 25 tab, 20 ref, append. OWRT B-040-NJ(5). 14-31-0001-3614.

Descriptors: *Estuarine environment, *Impaired water quality, *Lagoons, *Aquatic environment, *Environmental effects, *Wetlands, Bays, Coasts, Encroachment, Water quality, Water pollution, Salt marshes, Shores, Tidal waters, *New Jersey.
Identifiers: *Site development lagoons.

A large number of estuarine site development lagoon systems have been constructed along the New Jersey shore with little, if any, knowledge regarding the true nature of the system being created and its impact on the existing natural estuarine system. A comprehensive study and evaluation of these lagoon systems was undertaken including consideration of the physical, chemical, biological and socioeconomic conditions. While each chapter of the report includes a section on specific conclusions, certain general conclusions can be made. Namely, using Barnegat Bay as a standard, the lagoon waters were of poorer quality, due in large measure to the restricted and weakly-established water circulation patterns in the lagoons. In terms of the socioeconomic conditions, the residents are generally quite satisfied with their lagoon homes in

spite of their perception of major pollution and over-development problems. In fact, many owners are converting their homes to year-round residences.

Identifiers: *Environmental policy, *Environmental management, Effluent charges.

This paper analyzes the effects of three environmental policy instruments--effluent charges, effluent standards, and effluent treatment subsidies--in the context of a two-person two-firm general equilibrium model in which the distribution of income varies with the choice of policy instrument. It is demonstrated that, under reasonable assumptions about the income distribution process and the nature of consumer preferences, each policy instrument corresponds to a different optimal quantity of effluent and a different set of optimal prices. The implication of this result is that consideration of income distriubtional effects should play an integral part in the formulation of optimal environmental management policies. (Bell-Cornell)

HYGIENIC STANDARDIZATION OF DIETHYLBENZENE IN WATER BODIES, (IN RUSSIAN),
Kiev Research Inst. of General Communal Hygiene (USSR).
K. F. Meleshchenko.
Gig Sanit 6, p 90-92, 1975.

Descriptors: *Ion exchange, Resins, Public health, *Water quality standards, *Organic compounds, Toxicity, Odor, Lethal limit, Organoleptic properties.
Identifiers: *Benzene, Rabbit, Styrene, Dichloroethane, *Divinylbenzene, *Ion exchange resins.

The production of ion-exchange resins is related to the use of divinylbenzene, the starting materials for which are diethylbenzene, styrene, dichloroethane, etc. The threshold concentration of diethylbenzene in water with respect to odor and taste was 0.04 - 0.05 mg/l. Diethylbenzene doses of 0.0025 and 0.25 mg/kg do not affect warm-blooded animals (rabbits), whereas a dose of 2.5 mg/kg does. In the latter case there is a statistically significant decrease of the weight of the adrenal glands and summation of subthreshold impulses. The recommended maximum allowable concentration of diethylbenzene in water bodies is 0.04 - 0.05 ml/l, with the limiting index of the hazard of this preparation being its effect on the organoleptic properties of water.

SWIMMING PARTICIPATION AND WATER QUALITY IN TOMPKINS COUNTY, NEW YORK,
Cornell Univ., Ithaca, N. Y. Dept. of Natural Resources.
T. L. Brown, and G. R. Reetz.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 357, Price codes: A04 in paper copy, A01 in microfiche. Cornell University Water Resources and Marine Sciences Center, Completion Report, November 1976. 53 p, 1 fig, 17 tab. OWRT B-039-NY(1). 14-31-0001-4110.

Descriptors: *Swimming, Water quality, *Water quality standards, *Recreation, *New York, Social participation, *Attitudes, Evaluation, Social values.
Identifiers: *Tompkins County(NY).

Following an intensive literature search, a systematic sample of Tompkins County households were surveyed to determine frequency of swimming participation, the degree to which residents swim in waters not approved for swimming, degree of public understanding and agreement with existing swimming standards, and the degree to which swimming participation is affected by perceptions of water quality. Findings indicated that most of Tompkins County's outdoor swimming occurs in natural area streams that are not regularly monitored by the local health department for water quality. Further, the majority of responding adults could not give an evaluation on the degree of strictness of existing standards for swimming. Attitudes toward water quality appear to have some influence on swimming participation and the choice of a swimming area, but in Tompkins County, other considerations such as convenience were more important.

Identifiers: *Arsenic, *Cyanide, Arylphosphate, Benzene, 3,3'-dichloro-benzidine, *Ethylene glycol, Hydrazine methyl chloroform, *Anapthylamine, Acrylonitrite, Monitoring capability, *State Monitoring agencies.

In June 1974, the Office of Toxic Substances, EPA, contracted with MITRE to collect and analyze toxic substances data in the U.S. In the next 14 months, MITRE contacted agencies in 20 key states and collected and analyzed their monitoring data. This report describes that effort and discusses the amount, type and usefulness of the data and the toxic substances monitoring capabilities of the state agencies contacted. Substances studied were Arsenic, beryllium, cadmium, chromium, cyanide, lead, mercury, polychlorinated biphenyls, and other toxic substances. The monitoring capabilities of various states were described and the particular toxicity problems as viewed by the states are given. (See also W77-02205) (Katz)

SYSTEM FOR EVALUATION OF THE HAZARDS OF BULK WATER TRANSPORTATION OF INDUSTRIAL CHEMICALS,
National Academy of Sciences, Washington, D.C. Committee on Hazardous Materials.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-782 476, Price codes: A04 in paper copy, A01 in microfiche. Coast Guard Report CG-D-113-74, February 1974. 42 pp., 14 tab., 12 ref.

Descriptors: *Transportation, Ships, *Safety, Barges, Distribution, Harbors, Water pollution, Public health, Environmental Sanitation, Water quality, *Hazards, Negligence, *Safety, *Warning systems, Industries, Marketing.
Identifiers: *Bulk water transportation, Industrial chemicals, Fire hazard, Reactivity hazards.

The U. S. Coast Guard has requested the assistance of the Committee on Hazardous Materials of the National Research Council in developing a system of evaluating the potential hazard associated with the water transportation of industrial chemicals in bulk. Numerous schemes for assessing the hazards of materials have been developed by various organizations, but none completely fulfils the Coast Guard requirements since most of the existing schemes have been developed for purposes other than assessment of hazard in bulk water transportation. It was also suggested by the Coast Guard that the system of hazard evaluation should deal with the several kinds of hazards presented in varying degrees by individual chemicals. This is a report of results, to date, of the efforts of the Committee on Hazardous Materials to develop and evolve a scheme of hazard evaluation. (Katz)
W77-02206

ACID MINE DRAINAGE (A BIBLIOGRAPHY WITH ABSTRACTS),
National Technical Information Service, Springfield, Va.
January 1975, 137 p., 137 ref.

Descriptors: *Mine acids, *Mine drainage, *Mine wastes, *Mine water, *Bibliographies, *Abstracts, Mining, Environmental effects, Environmental control, Waste treatment, Ecology, Mining engineering, Engineering geology, Waste disposal

Various aspects of mine acid drainage are covered in 137 abstracts. Primarily they cover control and treatment techniques; however, also included are studies on the ecological effects, sources, and formation. (Katz)
W77-02207

WATER QUALITY IMPACTS OF URANIUM MINING AND MILLING ACTIVITIES IN THE GRANTS MINERAL BELT, NEW MEXICO,
Environmental Protection Agency, Dallas, Tex. Region VI.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 470, Price codes: A09 in paper copy, A01 in microfiche. Report EPA 906/9-75-002, September 1975, 182 p., 15 tab., 12 fig., 34 ref.

Descriptors: *Water quality, *Mining, Waste disposal, Water pollution, *Groundwater, Potable water, Surface water, *Uranium, *Radioisotopes, *Mine water, Mills, Waste disposal, Municipal water, *New Mexico, Public Health, Environment, Water supply.
Identifiers: *Selenium, *Uranium mining, *Uranium milling, *Grants mineral belt(N Mex).

Ground water in the study area is affected by mining and waste disposal associated with mining and milling. Contamination appears in close proximity to the mining and milling centers with the exception of more widespread selenium contamination of shallow ground water adjacent to the United Nuclear-Homestake Partners Mill. Contamination of municipally operated water supplies in the study area is not evident. Potable supplies derived from mine water at four industrial sites exceed applicable limits for selenium in drining water. Three such systems exceed limits for Radium 226. Recommendations developed are designed to assist the State in future regulation of uranium mining and milling for the purpose of safeguarding public health and insuring future environmental quality. (Katz)
W77-02208

EAGLE LAKE POLLUTION CONTROL PROJECT, EAGLE LAKE KANDIYOHI COUNTY, MINNESOTA, BENCH MARK STUDIES,
Minnesota Univ., Minneapolis. Water Resources Research Center
T. E. Straw, R. S. Abbott, R. J. Grohs, R. F. Holt, and J. J. Latterell
Bulletin 90, August 1976. 152 p, 34 fig, 36 tab, 54 ref. OWRT A-999-MINN(43), 14-34-0001-7050.

Descriptors: Community development, Soil disposal fields, Water pollution control, Lakes, *Minnesota, *Agricultural runoff, *Sewage, *Nutrient removal, Diversion, *Eutrophication, Recreation, *Attitudes.
Identifiers: *Eagle Lake(Minn)

Cooperative efforts are described of a lake community and several governmental agencies that were undertaken to alleviate increasing cultural eutrophication in Eagle Lake, Kandiyohi County, Minnesota. Two non-point nutrient sources were identified: agricultural runoff and domestic sewage. A lake-encircling collection line now diverts the sewage to a treatment plant. Earthen dams with soil absorption fields have been tested as a mean of removing nutrients from part of the watershed runoff. Coincident with initiation of these anti-pollution measures, a comprehensive research project was initiated. Detailed studies of the chemical, physical, and biological conditions in the lake were conducted before the sewage system was completed. Water and nutrient budget estimates have been made. Eagle Lake can be classified as moderately eutrophic. Socio-economic surveys of lakeshore residents, other watershed residents, and non-resident ice fishing users resulted in a base line profile of recreational use of Eagle Lake and of attitudes toward the lake and toward the anticipated improvements. Hopefully these data will suggest a model of community action. These benchmark studies, while of intrinsic interest, will reach their ultimate utility as a reference for comparison with conditions in the watershed after the pollution control measures have been in operation. Such future studies are anticipated.
W77-02215

A COMPREHENSIVE SYSTEMS ENGINEERING STUDY OF THE TRUE ECONOMIC VALUE OF UNPOLLUTED WATER VERSUS VARYING DEGREES OF POLLUTED WATER,
Rhode Island Univ., Kingston. Dept. of Mechanical Engineering and Applied Mechanics.
C. D. Nash, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 493, Price codes: A02 in paper copy, A01 in microfiche. Completion Report, (1976). 20 p, 91 ref. OWRT A-057-RI(1). 14-31-0001-4040.

Descriptors: Costs, *Systems analysis, Water pollution, Potable water, *Cost comparisons, Cost analysis, *Pollution taxas(Charges), *Water costs.
Identifiers: *Water pollution costs.

True costs associated with water pollution are described. Offset costs are included. Total water pollution cost is specified as including cleanup costs, industrial use costs, recreational use costs, health costs, and esthetic costs. A new concept is introduced of using the offset costs of pollution as a basis for setting tariffs to place competition between domestic and foreign companies on an equal global pollution basis.
W77-02220

THE ROLE OF MOLLUSKS AS BENTHOS COMPONENTS IN PURIFICATION OF WATER BODIES FROM ASCARIS SUUM EGGS, (IN RUSSIAN),
Chelyabinsk Meditsinskii Institut (USSR)
S. E. Asitinskaya.
Parazitologiya (Leningr) 9(5), p 432-433, 1975.

Descriptors: *Mollusks, *Benthos, *Water purification
Identifiers: *Ascaris Suum eggs, Bithynia tentaculata, Galba-palustris, Radix-auricularia, Radix-lagotis, Radix-ovata, Radix-peniger

Fresh water mollusks Galba palustris and Bithynia tentaculata feed on Ascaris eggs, destroy them (10-20%) and hinder their development as compared to controls. These mollusks participate in the purification of water bodies from Ascaris eggs. Eggs swallowed by the mollusks Radix ovata, R. peniger, R. auricularia, R. lagotis develop normally. Radix serve to scatter eggs over the bottom of the water body.--Copyright 1976, Biological Abstracts, Inc

SOME HYGIENIC PROBLEMS RELATED TO THE USE OF HERBICIDES OF THE 2,4-DICHLOROPHENOXYACETIC ACID GROUP, (IN RUSSIAN),
Tomsk Meditsinskii Institut (USSR)
V. P. Paderova
Gig Sanit 9, p 96-97, 1975.

Descriptors: *Herbicides, Public health, Trees, *Acids, *2-4-D, Chemcontrol, *Weed control, Shrubs, Organic acids, Vegetation, Water pollution sources
Identifiers: *Acetic acids.

Herbicides (derivatives) of the 2,4-D group used for chemical weeding and eradication of undesirable trees and shrubs enter into surface waters and aquifers. The entry of the herbicides into water sources depends on the relief, meterological conditions and other factors. Maximum contamination of water sources occurs with the use of large doses of the herbicides for eradicating trees and shrubs in the immediate vicinity of surface waters.--Copyright 1976, Biological Abstracts, Inc.

PARROT'S-FEATHER (MYRIOPHYLLUM AQUATICUM (VELL.) VERDC.), AN AGGRESSIVE WATER WEED IN PORTUGAL, (IN PORTUGUESE),
Estacao Agronomica National, Oeiras (Portugal).
A. N. Teles, and A. R. Pinto Da Silva.
Agron Lusit 36(3), p 307-324, 1975.

Descriptors: *Aquatic weeds, Europe, *Aquatic weed control, Water pollution control, Chemcontrol, Fertilizers.
Identifiers: Myriophyllum-aquaticum, *Parrotsfeather, *Portugal, River Tagus(Portugal).

The occurrence of M. aquaticum in Portugal was announced in 1961. However, collections of this plant in NW and central localities date from 1936 and 1953. The available data from herbaria and direct searching indicate that the strongest and most aggressive infestation occurs in ditches and small rivers with reduced flow in the lower valley of the River Tagus in Ribatejo province. A revision of control procedures is given and the possibilities of the utilization of this water weed as an additional source of feedstuffs and as a fertilizer to offset the costs of mechanical removal of the plants and their use in stripping nutrients from excessively eutrophic waters are discussed. Chemical analyses concerning Portuguese plants are presented and compared with those of other aquatic species.--Copyright 1976, Biological Abstracts, Inc.

HYGIENIC STANDARDIZATION OF OCTYLIC STABILIZERS OF POLYVINYLCHLORIDE IN WATER BODIES, (IN RUSSIAN),
Moskovskii Gosudarstvennyi Meditsinskii Institut I) (USSR).
). V. Golovanov.
Gig Sanit 5, p 36-39, 1975.

Descriptors: *Water quality standards, Chlorides, Public health, Organic compounds, Lethal limit, Rodents.
Identifiers: *Polyvinylchlorides, *Octylic stabilizers.

The threshold concentrations (TC) of diisobutylmaleatedioctylin (DIBMDP) and ethylenisthioglycolatedioctylpewter (EBTGDP) according to the organoleptic indiced of noxiousness mount of to 0.1 mg/kg. Judging by the effect roduced on the sanitary regimen of water bodies ne TC of DIBMDP equals 0.6 mg/l and that of BTGDP 0.01 mg/l. The ineffective dose of IBMDP in a chronic sanitary-toxicologic experiient amounts to 0.001 mg/kg and that of EBTGDP 0.0001 mg/kg, which is equivalent to their concentrations in water at levels of 0.02 and 0.002 mg/l. These are the recommended maximal permissible concentrations for water bodies. (Experiments were conducted on rats, rabbits and guinea pigs.)--Copyright 1976, Biological Abstracts, Inc.

WAYS OF PREVENTING THERMAL POLLUTION OF WATER BODIES BY WASTEWATERS OF NUCLEAR POWER PLANTS, (IN RUSSIAN),
A. N. Marei.
Gig Sanit 11, p 83-86, 1975.

Descriptors: *Thermal pollution, *Nuclear powerplants, Water pollution control, *Pollution abatement, Water quality standards, *Cooling towers, *Mixing, Legislation.
Identifiers: *USSR water pollution legislation.

Nuclear power plants are a potential source of thermal water pollution. To regulate temperature in natural water bodies, Soviet legislation established standards allowing its summer increase by no more than 3C. Observance of this requirement can be provided in 2 basic ways. The first is to accelerate the mixing of thermal discharges with the entire water mass, mainly by using the hydrologic factor. Its effectiveness depends primarily on the relationship of the wastewater discharge and river discharge. In Soviet practice this method as a rule is not used. The second method is to localize the thermal waters in the region of their occurrence and cool them in closed circulating water supply systems. At comparatively small nuclear power plants this is achieved by cooling towers and at new, larger plants by a system of artificial cooling ponds.--Copyright 1976, Biological Abstracts, Inc.

EFFECTS OF WATERHYACINTH COVER ON WATER CHEMISTRY, PHYTOPLANKTON, AND FISH IN PONDS,
Auburn Univ., Ala. Dept. of Fisheries and Allied Aquacultures.
C. McVea, and C. E. Boyd.
Journal of Environmental Quality, Vol. 4, No. 3, 1975. p 375-402, 5 tab, 27 ref.

Descriptors: *Water hyacinth, Aquatic life, *Water chemistry, *Aquatic weeds, Water quality, Fish, Ponds, Pondweeds, Phosphorus, *Phytoplankton, Aquatic weed control.

Waterhyacinth cover of 0, 5, 10, or 25% surface was established in fertilized ponds stocked with the fish, Tilapia aurea, at Auburn, Alabama. Measurements of water chemistry, phytoplankton density, and fish production were made during the 1973 growing season. Phytoplankton production was less in ponds with 10 and 25% cover by waterhyacinth than in ponds with 0 and 5% cover. Competition of waterhyacinth with phytoplankton involved shading and removal of phosphorus from the water. Concentrations of dissolved oxygen were lowest in ponds with 25% cover, but oxygen tensions in all ponds were adequate for survival and growth of fish. Reduction in phytoplankton growth in ponds with 10 and 25% cover resulted in much lower fish prodcution. The presence of 5% cover by waterhyacinth did not significantly affect fish production. A COMPARISON OF NITROGEN, PHOSPHORUS, AND CARBON IN SEDIMENTS AND SOILS OF CULTIVATED AND NONCULTIVATED WATERSHEDS IN THE NORTH CENTRAL STATES,
Agricultural Research Service, Oxford Miss.
J. C. Ritchie, A. C. Gill, and J. R. McHenry.
Journal of Environmental Quality, Vol. 4, No. 3, 1975. p 339-341, 5 tab, 12 ref.

U. OF I. URBANA-LIBRARY

Descriptors: *Nitrogen, *Phosphorus, *Carbon, *Return flow, Water quality, Sediments, Nutrients, Nutrient removal, Cultivation, Cultivated lands, Watersheds(Basins), Central US.

Soil and sediments from six cultivated watersheds and from six noncultivated watersheds were sampled and the concentration of nitrogen, phosphorus, and carbon was determined. No significant difference was found in the concentration of N, P, or C with depth in the soils or sediments. Concentration of N,P, and C were not significantly different in the soils and sediments of the cultivated watersheds; however, the sediments of the noncultivated watersheds had significantly less N and organic P than the watershed soils. Less accumulation of N,P, and C is occurring in the noncultivated watershed sediments than in the cultivated watershed sediments. These data indicate that sediment source is probably an important factor in determining N,P, and C concentration in reservoir sediments. (Skogerboe-Colo St)

THE DISTRIBUTION OF TWO MOSQUITO-LARVIVOROUS FISHES, GAMBUSIA AFFINIS AND ORYZIAS LATIPES, IN THE TOKYO METROPOLITAN AREA, (IN JAPANESE),
Tokyo Univ. (Japan). Dept. of Parasitology.
Y. Wada, Y. Sawara, J. Niiyama, Y. Fukabori, and Y. Nakamura.
Jpn J Sanit Zool. 25(3), p 285-288, 1974.

Descriptors: *Ecological distribution, *Distribution, *Fish, *Streams, *Ditches, *Swamps, Surface waters, Water pollution, Rivers, Sewage, Ponds.
Identifiers: Gambusia affinis, Japan, *Medaka, Oryzias latipes, Tokyo, *Topminnow, *Mosquito fish, Rice paddies, Kanto plain, *Bay of Tokyo, Yokohama, Chiba.

The distribution (in the Tokyo Metropolitan area; Kanto Plain) of the 2 mosquito-larvivorous fishes, G. affinis (top minnow or mosquito fish) and O. latipes (medaka) was studied by direct inspection and from the response to questionnaires sent to 859 middle schools in the prefectures of Gumma, Tochigi, Ibaraki, Saitama, Chiba, Kanagawa and Tokyo, Japan. G. affinis is a poeciliid ovoviviparous fish introduced into Japan in 1916 from southern USA via Hawaii and Taiwan for malaria control, and was noted recently to be distributed in rather polluted waters in and around the city of Tokyo, whereas, O. latipes is a native fish widely distributed in streams and ditches containing cleaner water. G. affinis was found in ditches and swamps in the more urbanized areas near the coast of the Bay of Tokyo, especially in the cities of Tokyo, Yokohama and Chiba, and also in the areas north of Tokyo lined by the Rivers Arakawa and Furutonegawa, where the waters were more or less polluted by sewage. Sporadic distributions of this species were noted in the ponds in Tokyo, Utsunomiya and Tsuchiura where the fish had been introduced artificially. O. latipes was found in the rural areas surrounding these large cities, particularly in rice paddles and streams in Kanagawa, Saitama, Gunma, Tochigi, Ibaraki and Chiba Prefectures. (Large numbers of Gambusia were observed inhabiting the Bay of Tokyo near the wharf of Tokyo Harbor; it is probably established in a number of canals along the Bay shore.)--Copyright 1975, Biological Abstracts, Inc.

PRELIMINARY SELECTION OF STORM-WATER BASINS SUITABLE FOR INFILTRATION OF RECLAIMED WATER IN NASSAU COUNTY, LONG ISLAND, NEW YORK,
Geological Survey, Albany, N.Y. Water Resources Div.
D. A. Aronson.
Open-file report 76-668, May 1976. 39 p, 2 fig, 3 tab, 8 ref.

Descriptors: *Groundwater recharge, *Artificial recharge, *Reclaimed water, *Storm runoff, *Infiltration, Controlled drainage, Water storage, Groundwater availability, Water supply, *New York.
Identifiers: *Nassau County(NY).

A survey was made of 205 storm-water basins south of the ground-water divide and north of Hempstead Turnpike in Nassau County, Long Island, N.Y., to determine which would be best suited for infiltration of reclaimed water. Selection depended on infiltration area, location with respect to the ground-water divide and to planned transmission mains, tendency to retain storm runoff, underlying lithology, and depth to water table. The total maximum infiltration area of 14 selected basins is 60.2 acres, or 2,620,900 square feet (0.24 square kilometers). If 5-foot (1.5-meter) - high partitions were constructed in the basins to divide each into approximately equal halves and reclaimed water were applied in half of each basin to a depth of 5 feet (1.5 meters), using an application-rest cycle, a total area of 25.2 acres (0.10 square kilometers) would be available for supplemental recharge; the remaining infiltration area could be used for disposal of storm runoff. (Woodard-USGS)

ESTUARINE POLLUTION CONTROL: OBJECTIVES AND PRIORITIES,
K. D. Staples.
Proceedings of the Institution of Civil Engineers, Vol. 60, Part 1, p 329-343, August, 1976. 5 fig, 2 tab, 8 ref.

Descriptors: *Estuaries, *Water pollution control, *Hydraulics, *Sewage, *Industrial wastes, Suspended solids, Organic compounds, Heavy metals, Toxicity, Dissolved oxygen, Tidal effects, Control systems, Economics, Aeration, Mathematical models, Surface waters, Effluents.
Identifiers: Great Britain.

The forms and hydraulic regimes of estuaries are described along with the nature and effect of pollutants arising from sewage and industrial waste discharges on developed estuaries. Pollutants contributed to a developed estuary normally include three important elements: suspended solids, dissolved colloidal biodegradable compounds, and dissolved toxic chemicals including heavy metals. The effect of individual pollutants on a particular estuary is dependent on their volume and the estuary regime, particularly the tidal excursion and retention period within the waters. The point of pollutant contribution is important in all cases, with the pollutant's effect being greater at higher points of contribution in the estuary. Where high water quality is desired, a minimum dissolved oxygen level of about 40% is recommended. Mathematical modeling procedures can be used to equate pollutant input with the dilution and transport effected by the tidal flow and the reaeration and oxidation potential of the estuary, thus allowing for the establishment of pollution control policies that minimize expense. The costs of proposed estuary pollution control works for several major British estuaries are compared, and priorities for the staged implementation of typical control schemes are discussed. TOWARD A MORE MEANINGFUL INDEX OF SLUDGE QUALITY,
Carnegie-Mellon Univ., Pittsburgh, Pa.
B. Fitch, and P. Kos.
Journal Water Pollution Control Federation, Vol. 48, No. 8, p 1979-1987, August, 1976. 11 fig, 1 ref.

Descriptors: *Activated sludge, *Suspended solids, *Physical properties, *Measurement, *Waste water treatment, Biological treatment, Performance, Sludge, Mathematical studies.
Identifiers: Sludge volume index, *Sludge quality index.

A new index of sludge quality which is independent of the concentration and characteristic of solids quality is proposed as a replacement for the conventionally used sludge volume index. The new index of sludge quality accounts for the functional relationship between sludge volume index and suspended solids and is based on the same test data as the sludge volume index. Although the existing procedure for sludge volume index determination correlates reasonably well with settleability when the settled sludge volume is below about 300 cu cm/liter, above that level the sludge volume index is a strong function of suspended solids concentration. The sludge quality index which takes this functional relationship into account thus offers a superior means for characterizing the settleability of activated sludge. When the solids settle to less than about 300 cu cm, the two indices are identical. (Kreager-FIRL)
W77-02378

THE INFLUENCE OF HIGH QUANTITIES OF MANURE ON SOIL WATER, AND PLANTS, (IN GERMAN),
Agricultural Experiment Station, Oldenburg (West Germany).
H. Vetter, and A. Klasink.
Landwirtsch Forsch 28(3), p 249-268, 1975.

Descriptors: *Farm wastes, Soil water, Plant pathology, Waste disposal, Crops, Cattle, Water reuse, Recycling.

Risks of water and soil pollution due to spreading manure in excess are small; only 2% of all livestock farms have excess manure in relation to their cultivated land. Most must use large amounts of mineral fertilizer. When a large region has excess manure, disposal is a problem. The waste disposal law prescribes that land spreading of manure must be controlled when manure application exceeds the usual quantity (the amount produced by 3 cattle equivalents). The allowable quantity of manure may vary between 3 and 6 cat-

le equivalents, depending on soil characteristics and cultivated crops.--Copyright 1976, Biological Abstracts, Inc.

ECONOMIC EFFECTS OF ENFORCEMENT VARIABLES ON COMMERCIAL OIL POLLUTION CONTROL STRATEGY,
Naval Postgraduate School, Monterey, Calif.
R. C. Cook.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-016 442, Price codes: A05 in paper copy, A01 in microfiche. MS thesis, September 1975. 91 p. 8 fig., 10 tab., 24 ref., 3 append.

Descriptors: *Oil spills, *Decision making, *Economic justification, *Industries, Oil pollution, Pollution abatement, Model studies, Evaluation, Water pollution control, Law enforcement, Costs, Penalties(Legal), Management, Attitudes.
Identifiers: *Microeconomic decision model, Pollution control inducement, Corporate behavior.

The decision making process of firms engaged in potentially oil polluting activities is analyzed in an effort to isolate the effects of penalties and other pollution costs which may motivate pollution control. An economic decision model for oil pollution control strategy is developed on the basis of 1973 and 1974 data taken from the Coast Guard's Pollution Incident Reporting System. The model and analysis breakdown the major internal and external decision parameters and show the impact of civil penalties, cleanup costs, and internal costs on a firm's pollution control strategy. Civil penalties appear to be most effective in controlling minor spills, since the costs of product lost and expected cleanup are small relative to the penalties. As the spills increase in size, costs of cleanup and loss of product become much more important while the civil penalty becomes negligible. Cleanup costs have a significant impact on the decision in that they account for the largest portion of the external costs that the firm must internalize. However, application of the model to large scale spills reveals that the firm's internal costs have the largest influence on its pollution control strategy. This model may be extended into other areas such as fisheries enforcement, other forms of pollution control, and government intervention and regulation. (Luedtke-Wisconsin)

ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES: THE TEXTILES, FRICTION AND SEALING MATERIALS SEGMENT OF THE ASBESTOS MANUFACTURING INDUSTRY,
Little (Arthur D.), Inc., Cambridge, Mass.
S. V. Margolin, and B. U. N. Igwe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 683, Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA-230-2-74-030, July 1975. 72 p. 2 fig, 16 tab. 18, 68-01-1541.

Descriptors: *Economic impact, *Water pollution control, *Asbestos, *Standards, Sealants, Costs, Capital costs, Annual costs, Prices, Pricing, Employment, Foreign trade, Investment, Profits, Industrial plants, Industrial wastes, Industrial production, Pollution abatement.
Identifiers: *Asbestos manufacturing industry, *Effluent standards, Gaskets, Friction materials, Asbestos textiles.

This study supplements the EPA Effluent Limitations Guidelines analysis for the textiles, friction, and sealing materials segment of the asbestos product manufacturing industry by estimating the broader economic effects of the application of required effluent treatment technologies. None of the 75 plants in this segment of the industry was judged to be in danger of production curtailment or plant closure due to the imposition of the proposed standards. Only one sheet gaskets manufacturing plant is expected to incur additional costs ($80,300 incremental capital expenditures and annual water treatment costs of $35,500) to comply with the Best Practicable Technology standards. To meet the Best Available Technology (BAT) criteria, the above plant and four friction materials manufacturing plants are expected to incur total additional capital costs of $632,500 and annual water treatment costs of $139,200. No prices increases are predicted, with the exception of a 1% rise in the friction materials group as a result of BAT standards. Furthermore, no adverse impacts are expected on production and market growth or the historically favorable balance of payments position with respect to these products. 'New Source Performance Standards' are not expected to deter investments in new facilities. (Luedtke-Wisconsin)

DEVELOPMENT DOCUMENT FOR EFFLUENT LIMITATIONS GUIDELINES AND NEW SOURCE PERFORMANCE STANDARDS FOR THE PHOSPHORUS DERIVED CHEMICALS SEGMENT OF THE PHOSPHATE MANUFACTURING POINT SOURCE CATEGORY,
Environmental Protection Agency, Washington, D.C. Effluent Guidelines Div.
E. E. Martin.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-241 018, Price codes: A08 in paper copy, A01 in microfiche. Report No. EPA-440/1-74-006-a, January 1974. 161 p. 12 fig., 20 tab., 73 ref.

Descriptors: *Standards, *Effluents, *Chemical industry, *Phosphorus compounds, *Technology, Recycling, Pollutants, Capital costs, Federal Water Pollution Control Act, Annual cost, Waste water treatment, Industrial wastes, Economic impact.
Identifiers: *Effluent guidelines, *Zero discharge, Phosphoric acid, Phosphorus pentoxide, Phosphorus pentasulfide, Sodium tripolyphosphate, Calcium phosphates, Ferrophosphorus, Phosphorus trichloride, Phosphorus oxychloride, Phosphate manufacturing industry.

WATER RESOURCES SCIENTIFIC INFORMATION CENTER U. S. DEPT. OF INTERIOR WASHINGTON, D. C. 20240

Effluent limitation guidelines and new source performance standards for the phosphate manufacturing industry to be achieved by July 1, 1977 and July 1, 1983 were developed. The phosphorus production subcategory of the industry is characterized by large quantities of raw process wastes, including highly deleterious phossy water and highly acidic scrubber and quenching waste waters. However, through the use of in-process and end-of-process controls, production plants currently demonstrate abatement practices resulting in 97% or greater reduction in the raw waste load before discharge, and the total recycle of process water without any discharge has been demonstrated using the best practicable control technology, essentially solving the most serious raw waste problem in the industry. The phosphorus-consuming subcategory, while consisting of essentially dry processes, uses water for air pollution abatement, cleaning and washing containers, and transferring the raw material, all resulting in acidic or phossy waste water. Sufficient reduction of effluents has not yet been achieved in this portion of the industry, but currently available technology exists to either recycle or neutralize and remove these wastes. Currently available practicable technology to achieve zero discharge also exists for the phosphate segment of the industry, though outside contamination may prevent reuse of food grade calcium phosphate waste waters. (Luedtke-Wisconsin)

ENVIRONMENTAL TRUST FUNDS: AN EVALUATION,
RIVUS, Inc., Glen Burnie, Md.
W. Smith, D. Hale, M. Rose, and J. Goldstein.
Available from the National Technicial Information Service, Springfield, VA 22161 as PB-251 306, Price codes: A06 in paper copy, A01 in microfiche. Report No. EPA-230/3-76-002-append. D, July 1974. 122 p. 9 fig., 34 ref., 2 append. 68-01-2462.

Descriptors: *Evaluation, *Financing, *Treatment facilities, *Sewage treatment, *Construction costs, Federal Water Pollution Control Act, Government finance, Economic efficiency, Pollution abatement, Equity, Economic feasibility, Income distribution.
Identifiers: *Trust funds, *Construction Grant Program, Financing alternatives.

Economic, fiscal legal, administrative, and institutional aspects of alternate financing arrangements for pollution abatement under the Federal Water Pollution Control Act Amendments are investigated, with particular emphasis on the utilization of trust funds. Six alternate financing arrangements for the Construction Grant Program are examined and three alternative arrangements are considered: earmarking benefit-related taxes, rate set by Congress; and earmarking benefit-related taxes, rate set by formula. In addition, the program's current financing arrangements and two unconventional options, open trust funds and off-budget financing, are illustrated. Evaluation criteria include efficiency, equity, income distribution, effectiveness, and feasibility. It is concluded that while the existing financial arrangement may be deficient in the economic efficiency and equity areas, it is effective in generating an adequate supply of funds. Its replacement by an environmental trust fund would not result in any net advantage; while it would offer a coherent framework for consideration of all program aspects under one title, it would also worsen certain economic effects of the program. If a trust fund arrangement were to be implemented, it may incorporate benefit-related taxes, have advantages from the standpoints of equity, income distribution, allocational efficiency, and use debt receipts to finance grants. NITRATE REMOVAL FROM WATER AT THE WATER-MUD INTERFACE IN WETLANDS,
Louisiana Agricultural Experiment Station, Baton Rouge.
W. H. Patrick, Jr, R. D. Delaune, R. M. Engler, and S. Gotoh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-253 791, Price codes: A05 in paper copy, A01 in microfiche. Report No. EPA-600/3-76-042, April 1976. 87 p. 25 fig., 5 tab., 22 ref. XH1627, R-800428.

Descriptors: *Nitrates, *Denitrification, *Wetlands, *Oxidation-reduction potential, Oxygen, *Mud-water interfaces, *Louisiana, Swamps, Salt marshes, Flooding, Rice, Manganese, Iron, Sulfur, Ammonia, Nutrient removal.

Flooded swamp and coastal marsh soils in Louisiana have a high capacity for nitrate reduction, according to research focused: (1) on learning how rapidly, how completely and by what mechanism nitrate is removed by biological reduction from shallow surface water in swamps, marshes and flooded soils, and (2) to determine the oxidation-reduction properties of the water-mud interface that control or influence the reduction of nitrate to nitrogen gas. Oxidized and reduced layers in flooded soil were differentiated according to the vertical distribution of the oxidation-reduction (redox) potential and concentrations of manganous manganese, ferrous iron, sulfide, nitrate and ammonium. Redox potential was measured with a special motor-driven assembly which pushed a platinum electrode through a soil sample at a steady rate. From laboratory experiments, it was found that nitrate added to shallow floodwater rapidly disappeared, oxygen loss from sediments occurred rapidly and nitrate reduction was not inhibited by up to 16 ppm oxygen dissolved in soil suspensions. The nitrate was not reduced in the floodwater but filtered downward into the anaerobic soil layer. Additions of organic matter to a mineral soil flood for rice culture decreased the thickness of the aerobic-anaerobic zone at the soil-water interface and increased the rate of nitrate reduction. (Harris-Wisconsin)

STUDIES ON LAKE RESTORATION BY PHOSPHORUS INACTIVATION,
Corvallis Environmental Research Lab., Oregon.
W. D. Sanville, A. R. Gahler, J. A. Searcy, and C. F. Powers.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-253 435, Price codes: A04 in paper copy, A01 in microfiche. Report No. EPA-600/3-76-041, April 1976. 53 p. 21 fig., 2 tab., 17 ref. 1BA608.

Descriptors: *Nutrient removal, *Sodium compounds, Lakes, Water quality, Phosphates, Chemicals, Chemical reactions, Phosphorus, Cyanophyta, Chlorophyta, Ammonia, Standing crops, Productivity, Iron, Manganese, Dissolved oxygen, Acidity.
Identifiers: *Lake restoration, *Nutrient inactivation, *Sodium aluminate, *Phosphorus inactivation, Cline's Pond(Or.), Kjeldahl nitrogen.

Sodium aluminate had at least partial effectiveness as an agent of nutrient inactivation in an attempt to control and reduce eutrophication of a farm pond, although firm conclusions about the effectiveness of the treatment could not be drawn because of a lack of uniformity of limnological parameters in the pond during the two-year period preceding the start of the experiment. Data was sought at Cline's Pond near Corvallis, Oregon on the ability of sodium aluminate to scavenge phosphate in the water column, to prevent resolubilization of phosphate and to inhibit primary production. In general, two years after inactivation there was a lessening of total phosphate, ammonia, total Kjeldahl nitrogen, iron, manganese and the algal standing crop. Other results were increased transparency, a more uniform distribution of dissolved oxygen and a shift in dominance from blue-green to green algae. The method seems promising for eutrophication reduction where the lake lacks significant flowthrough and where nutrient influx can be controlled. However, use of the technique must first be more fully evaluated because of short-comings in present knowledge about long-range environmental effects of sodium aluminate. (Harris-Wisconsin)

STRIP-MINING TECHNIQUES TO MINIMIZE ENVIRONMENTAL DAMAGE IN THE UPPER MISSOURI RIVER BASIN STATES,
Bureau of Mines, Denver, Colo. Intermountain Field Operation Center.
F. H. Persse
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 843, Price codes: A04 in paper copy, A01 in microfiche. Information Circular 8685, September 1975. 58 p. 11 fig., 9 tab., 18 ref., 3 append.

Descriptors: *Strip mines, *Land reclamation, Coals, Lignite, Equipment, Montana, North Dakota, Wyoming, Mining, Water pollution, Air pollution, Pollution abatement, Excavation, Costs, Land use, Geology, Climates, Revegetation, Environmental effects, Earth handling equipment, *Missouri River.
Identifiers: *Upper Missouri River Basin States

Geology, climate, and current land use information in the Upper Missouri River Basin are presented to assist strip mining and strip mining land reclamation operations. Proven methods of air and water pollution control and mined land restoration are described along with untried methods and equipment for land reclamation. The semi-arid climate of the Upper Missouri River Basin necessitates suppression of dust for the well-being of both men and machinery. However, current air pollution control methods are expected to satisfy these needs in most instances. The prevention of water pollution at coal and lignite operations generally would include diverting surface water from the working area without increasing sedimentation or dissolved salt content, measuring all water entering and leaving the mine area, and constructing a settling basin for mine water containing sediments, which are to flow into a water course. Reclamation of strip-mined land will require a greater annual expenditure than that for air or water pollution control. Unit reclamation costs for the thick deposits are expected to be less than in other parts of the nation. These costs are part of the production costs and should be borne by the ultimate consumer. WATER HYACINTHS AND ALLIGATOR WEEDS FOR REMOVAL OF LEAD AND MERCURY FROM POLLUTED WATERS,
National Space Technology Labs., Bay St. Louis, Miss.
B. C. Wolverton, and R. C. McDonald
Available from the National Technical Information Service, Springfield, VA 22161 as N75 22937, Price codes: A02 in paper copy, A01 in microfiche. NASA TM-X-72723, April 1975. 12 p. 8 fig., 4 tab., 14 ref. RTOP 644-02-02.

Descriptors: *Alligatorweed, *Water hyacinth, *Water pollution control, *Heavy metals, Mercury, Lead, Metals, Toxicity, Water pollution sources, Absorption.

Alligator weeds and water hyacinths have demonstrated ability to rapidly absorb mercury and lead from rivers and distilled waters contaminated with these substances, raising the possibility that the method may be used as a means of controlling water pollution by toxic metals which, unlike most organic substances, are not degradable by natural processes. In a 24-hour period, water hyacinths in a laboratory experiment removed 0.176 mg of lead and 0.150 mg of mercury from a static water system per gram of dry plant material. During a similar period, alligator weeds removed 0.101 mg of lead per dry material gram, and reduced initial mercury levels of 0.875 ppm in river water and 0.920 ppm in distilled water below the detection limit of 1.0 ppb after six hours. Extrapolations of these results project a removal potentiality of 105.6 grams of lead and 90.0 grams of mercury per day with one hectare of water hyacinths, and a removal potentiality of 0.153 mg of mercury per gram of dry plant material with the alligator weeds in a six-hour period. The removal rate for the lead is projected on a basis of continual harvesting of the metal-saturated water hyacinths. Further research is in progress to evaluate the ability of the two plant species to remove other heavy metals as well as organic pollutants and nutrients. (Harris-Wisconsin)

USE OF PLANT PATHOGENS FOR BIOREGULATION OF AQUATIC MACROPHYTES,
Florida Univ., Gainesville. Dept. of Plant Pathology.
T. E. Freeman, R. Charudattan, and K. E. Conway.
In: Proceedings of a Symposium on Water Quality Management Through Biological Control, January 1975, p 20-23. 4 fig, 10 ref. OWRT A-027-FLA(7), 14-31-0001-5009.

Descriptors: *Biocontrol, Aquatic weeds, Plant pathology, *Aquatic weed control, Aquatic plants.
Identifiers: *Macrophytes, *Plant pathogen.

In a recent article in Weed Science enumerating the present status of projects on biological control of weeds in the United States and Canada, 75 plant species were listed as being under investigation as targets for biological control (Goeden et al. 1974). Out of this number, only five were included in programs investigating plant pathogens as biocontrol agents. Four out of the five were aquatic weeds under investigation at the University of Florida. Until the program was begun, surprisingly little consideration had been given plant pathogens as biological control agents for aquatic weeds. In fact, as pointed out in the review by Zettler and Freeman (1972) aside from some limited work in India conducted with PL 480 funds, all aspects of the study of diseases affecting aquatic plants had been virtually ignored. Certainly, aquatic plants are affected by diseases and, most certainly, plant pathogens have several desirable characteristics that make them ideal candidates for biological control agents. (Morgan-Florida)

ENVIRONMENT AND POLLUTIONS. SOURCES, HEALTH EFFECTS, MONITORING AND CONTROL,
F. Leh, K. V. Lak, and K. C. Richard.
Charles C. Thomas, Publishers: Springfield, Ill., 1974. 288 p, $14.75.

Descriptors: Environment, Water pollution, *Monitoring, Public health, Chemicals, Fertilizers, Air pollution, *Water quality standards, Pesticides, Industrial wastes, *Pollutant identification.

Global environmental problems are discussed and current information is reviewed in this monograph which is intended for college level students and researchers involved in environmental studies. The origins of current pollution problems are examined and followed by discussions on air pollution with topics on photochemical smog; sulfur compounds in the atmosphere; effects of air pollutants on vegetation, animals an man; global effects of air pollution; economic aspects of air poliffution; quantitative analysis of NO2, ozone, peroxyacyl nitrates, CO and hydrocarbons; and control of nitrogen oxides and sulfur emissions. The 2nd half of the text focuses on water pollution and covers: trace elements such as Hg, Pb, Cd, Co and Cu; pesticides and their biological effects; use of fertilizers; and determination of trace metals and organic chemicals. Removal of heavy metals, organic compounds, P and N are dealt with in the discussion on wastewater treatment. State air quality standards for gases, dusts and mists; maximum safe concentrations for trace metals; criteria for pesticides and herbicides in public water supplies; and, W H O standards in public water supplies are outlined in the appendices. Researchers, instructors and students will find this book valuable.--Copyright 1975, Biological Abstracts, Inc.

SOIL WARMING WITH POWER PLANT WASTE HEAT IN GREENHOUSES,
Oregon State Univ., Corvallis. Dept. of Soil Science.
L. Boersma, and K. A. Rykbost.
HortScience, Vol. 10(1), p. 28-30, February 1975. 3 tab, 9 ref. OWRT B-039-ORE(2).

Descriptors: *Soil temperature, *Heated water, Thermal pollution, Soil treatment.
Identifiers: Waste heat, *Soil warming.

A subsurface soil warming system consisting of parallel line heat sources, buried 52 cm deep and 122 cm apart, simulating a proposed arrangement for the use of power plant waste heat, was installed in a plastic covered greenhouse. Soil warming with a heat source temperature of about 36C increased soil temperatures substantially but had little effect on the air temperature.
W77-02526

EVALUATION OF CERCOSPORA RODMANII AS A BIOLOGICAL CONTROL OF WATERHYACINTHS,
Florida Univ., Gainesville. Dept. of Plant Pathology.
K. E. Conway.
Phytopathology, Vol. 66, No. 7, p 914-917, July 1976. 8 fig, 8 ref. OWRT A-033-FLA(1). 14-34-0001-7019.

Descriptors: *Biocontrol, Aquatic weeds, *Plant pathology, Waterhyacinth, *Aquatic weed control, *Florida, *Aquatic fungi, Reservoirs.
Identifiers: *Cercospora rodmanii, Rodman Reservoir(Fla).

A fungus, Cercospora rodmanii Conway, which was isolated from declining waterhyacinths in Rodman Reservoir in Florida, was evaluated for its biological control potential on waterhyacinths during two growing seasons (February-November). Results of greenhouse and field studies indicated that the fungus was responsible for the waterhyacinth decline. Infection was initiated on waterhyacinths in Lake Alice on the University of Florida campus during September and October, 1974. A combination of conidia and mycelia was applied to the plants. When the inoculum level was increased by a second similar spray application the disease spread rapidly. Browning of the waterhyacinths in the test pool was augmented in the later stages of the test by below-freezing temperatures. Cercospora rodmanii can be a virulent pathogen on waterhyacinth and its effect on field populations of waterhyacinth will be evaluated further to quantify damage to the plant. (Morgan-Florida)

CERCOSPORA RODMANII, A NEW PATHOGEN OF WATER HYACINTH WITH BIOLOGICAL CONTROL POTENTIAL,
Florida Univ., Gainesville. Dept. of Plant Pathology.
K. E. Conway.
Canadian Journal of Botany, Vol. 54, No. 10, p 1079-1083, 1976. 7 fig, 2 tab, 12 ref. OWRT A-027-FLA(9). 14-34-0001-6010.

Descriptors: *Biocontrol, *Florida, Reservoirs, Aquatic plants, *Water hyacinth, *Aquatic weed control.
Identifiers: *Cercospora rodmanii, *Pathogens.

A species of Cercospora was isolated from declining water hyacinths in the Rodman Reservoir in Florida. Differences between this isolate and a previously reported C. piaropi from water hyacinths and other morphologically similar species of Cercospora from other hosts warranted the establishment of a new species, C. rodmanii. Field evaluations of C. rodmanii indicate that it has biological-control potential for water hyacinth. (Morgan-Florida)
W77-02540

MYCOLEPTODISCUS TERRESTRIS LEAF SPOT ON WATERHYACINTH,
Florida Univ., Gainesville. Dept. of Plant Pathology.
R. Charudattan, and K. E. Conway.
Plant Disease Reporter, Vol 60, No 1, p 77-80. January, 1976. 1 fig, 10 ref. OWRT A-027-FLA(8). 14-34-0001-6010.

Descriptors: *Biocontrol, *Water hyacinth, Legumes, Root systems, Aquatic plants, Aquatic fungi.
Identifiers: *Mycoleptodiscus terrestris, *Leaf spots, *Plant pathogens.

Mycoleptodiscus terrestris, a root- and crown-rot organism on several legumes, is reported for the first time to cause a necrotic leaf spot on waterhyacinth (Eichhornia crassipes). In greenhouse tests, a suspension of conidia and mycelia of the organism sprayed on aerial parts caused spots on leaves of waterhyacinth, Capsicum annum, Glycine max, Lotus corniculatus, Lycopersicon esculentum, Melilotus alba, Phaseolus limensis, P. vulgaris, Pisum sativum, Trifolium incarnatum, and T. repens. In contrast, Arachis hypogaea, Cucumis sativus, Medicago sativa, Nicotiana tabacum, Trifolium hybridum, and T. pratense did not develop symptoms. Root discoloration and root rot occurred only on soil-inoculated legumes; crimson and white clovers were most susceptible. When waterhyacinth was floated in a suspension of conidia and mycelia, its roots or other parts were unaffected by the fungus. A mixture of ul-

traviolet and fluorescent lights induced profuse sporulation on potato-dextrose agar (PDA) cultures of M. terrestris. M. terrestris is not a virulent pathogen on waterhyacinth, but it may be a more ubiquitous pathogen than recognized. (Morgan-Florida)

DEVELOPMENT DOCUMENT FOR EFFLUENT LIMITATIONS GUIDELINES AND NEW SOURCE PERFORMANCE STANDARDS FOR THE PLYWOOD, HARDBOARD AND WOOD PRESERVING SEGMENT OF THE TIMBER PRODUCTS PROCESSING POINT SOURCE CATEGORY,
Environmental Protection Agency, Washington, D. C. Effluent Guidelines Div.
R. E. Williams.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-240 811, Price codes: A15 in paper copy, A01 in microfiche. Report EPA-440/1-74-023a, April, 1974. 339 p, 45 fig, 148 ref, 72 tab.

Descriptors: *Waste water treatment, *Water pollution treatment, *Water quality standards, Wastes, Industrial wastes, Water pollution sources, Water pollution, Water pollution control, Water quality control, Waste treatment, Regulation, Effluents, Lumber, Preservation, Water quality.
Identifiers: *Forest products industry, Plywood, Hardboards, Barking, Veneer.

Findings are presented of a study of the plywood, hardboard, and wood preserving segment of the timber products processing industry for the purpose of developing effluent limitation guidelines for existing plants and standards for new plants. The plywood, hardboard, and wood preserving segment of the industry was divided into 8 subcategories based primarily on distinctions generated from differences in the type of product manufactured and the specific processes involved. Best practicable control technology currently available for six of the subcategories was determined to be no discharge of process waste water pollutants into navigable waters. These subcategories include barking, veneer, plywood, hardboard (dry process), wood preserving, and wood preserving (boultonizing). Discharges are allowed for hydraulic barking operations and direct steam conditioning in the veneer manufacturing operations. Quantitative limitations are determined for the hardboard (wet process) and the wood preserving (steam conditioning) subcategories. The new source performance standards for the 6 subcategories is no discharge of pollutants into navigable waters. A discharge is allowed for effluents from hydraulic barking operations. With pretreatment, effluents from these segments of the wood processing industry can be discharged into publically owned waste water treatment plants. (Witt-IPC)

THE USE OF TENAX FOR THE EXTRACTION OF PESTICIDES AND POLYCHLORINATED BIPHENYLS FROM WATER. II. TESTS WITH ARTIFICIALLY POLLUTED AND NATURAL WATERS,
Rome Univ. (Italy).
V. Leoni, G. Puccetti, R. J. Colombo, and A. M. D'Ovidio.
Journal of Chromatography, Vol. 125, No. 2, p 399-407, October 13, 1976. 1 fig, 22 ref, 5 tab.

Descriptors: *Water analysis, *Pollutant identification, *Polychlorinated biphenyls, *Pesticides, *Separation techniques, Trace elements, Water pollution sources, Water chemistry, Filtration, Suspended solids, Wastes, Analytical techniques.
Identifiers: *Tenax.

The application of Tenax to the extraction of organic micropollutants such as pesticides and polychlorobiphenyls from waters has been studied. It was observed that in the presence of other pollutants (oil, surface-active substances, etc.) the results obtained with an absorption column of Tenax-Celite are equivalent to those obtained with the continuous liquid-liquid extraction technique. For natural waters that contain solids in suspension that absorb pesticides, it may be necessary to filter the water before extraction with Tenax and then to extract the suspended solids separately. Analyses of river and estuarine sea waters, filtered before extraction, showed the effectiveness of Tenax, and the extracts obtained for the pesticide analysis proved to be less contaminated by interfering substances than the corresponding extracts obtained by the liquid-liquid technique. (Witt-IPC)

Descriptors: *Energy, Natural resources, *Optimization, *Planning, *Powerplants, *Regional development, *Systems analysis, *Water resources development, *Mathematical models, Water demand, Alternative planning, Water allocation(Policy).
Identifiers: Coal conversion facilities.

Existing and projected energy facilities will, in the near future, place major demands on the country's water resources. These demands compete with many other uses of the resources, including municipal and industrial uses, navigation, irrigation, and water quality maintenance. The possible development of coal conversion facilities presents another potential water demand. Complex public sector problems such as: (1) the extent and development of coal conversion capacity, (2) interbasin transfer of water, (3) cooling technologies for large energy facilities, (4) diversion of Lake Michigan water, and (5) allowable withdrawal and consumptive uses of river water, all arise from the interlocking nature of the water resources-energy system. Although mathematical models cannot solve these problems directly, they can be useful in gaining insight into major issues associated with policy alternatives. With the aid of such models, quantitative trends such as costs and water development patterns associated with each decision alternative can be more readily identified. Mathematical models are presented for use in planning a regional allocation of water for energy facilities as well as for other water uses. These models include components for the interrelated water and energy subsystems. The use of these models in conjunction with other existing models in order to provide a better picture of the overall system is discussed. Since the models use widely available computer codes, they are practical and easy to utilize.

Descriptors: Planning, *Environmental effects, *Recreation, Programs, Utah, Idaho, Methodology, Lakes, Model studies, *Economic impact, *Alternative planning, Decision making, Cost-benefit analysis, *Input-output analysis.
Identifiers: *Bear Lake area(Utah-Idaho).

An attempt is made to provide the natural resource planner and decision maker with a practical methodology for evaluating the quantitative and qualitative aspects of recreation opportunity for alternative land and water resource development plans. Two linked models comprise the methodology used (initiated at Bear Lake which borders Utah and Idaho). The first model estimates the maximum carrying capacity of a water resource system for recreation activities. The output of this model is a listing of the maximum kinds, amounts and quality of recreation activity that can be performed in different seasons and in different sectors of the resource. The second model considers the limitations of access, facilities, budgets and policy in determining the mix of recreation opportunities which can be effectively supplied. This model is formulated as a linear programming problem and provides as output a list of the kinds and amounts of recreation opportunity that can actually be supplied. The approach developed here provides a link between the socio-economic and biological aspects of resource decision making. It is a supply-oriented approach which establishes a resource's physcical recreation carrying capacity and then, in light of various economic, political, social and administrative constraints, provides the planner with a view which may help make a rational decision.

METARATIONALITY IN BENEFIT-COST ANALYSES,
Louisville Univ., Ky. Systems Science Center.
R. K. Ragade, K. W. Hipel, and T. E. Unny.
Water Resources Research, Vol. 12, No. 5, p 1069-1076, October 1976. 8 tab, 10 ref.

Descriptors: *Water resources, *Management, *Methodology, *Cost-benefit analysis, Optimization, River basin development, Fishing, Projects, Decision making, Equations, Mathematical models, Systems analysis.
Identifiers: *Metarationality, Pseudo-Boolean functions, *Metagame analysis.

In water resources management, intangibles and multiple decision criteria exist as a result of various multipurpose needs. This paper presents a type of benefit-cost analysis which is capable of handling both quantitative and intangible benefits and costs. Using this methodology, it is possible for each interest group to assign values to benefits and costs according to what the group thinks is correct. Linguistic descriptions are sufficient for the intangibles. The method is based upon the theory of metarationality, and it is shown how pseudo-Boolean functions can be used to define the concepts of metarationality and also to record preferences of the parties involved in an analysis. In an example, the preferences of two nations involved in a fishing dispute are recorded using the pseudo-Boolean functions. The methodology is applied to a hypothetical river basin problem. Descriptors: Input-output analysis, Institutional constraints, Income, *Irrigation, Municipal water, Water rights, Cities, *Colorado, Water supply, Urbanization, *Economic impact, Agriculture, *Water transfer, *Suburban areas, *Condemnation, Legal aspects.
Identifiers: Colorado front range.

Rapid suburban growth north of Denver, Colorado has caused developing communities to expand their municipal water systems. In order to obtain additional water supplies, the cities of Thornton and Westminster have initiated condemnation suits against three irrigation companies to obtain their water rights. The three irrigation companies have a service area of about 40,000 acres--30,000 are currently irrigated. Of this land, 80 percent is class II and III, the highest classes found in Colorado. Approximately 400 farms and small tracts receive water from these companies--200 are commercial farms. Total agricultural production from the irrigated lands is about $8 million per year. Economic input-output analysis shows that irrigated agriculture contributes 561 jobs to the economy and over $4 million in net income. The cities and irrigation companies should work together to develop joint use of water rather than drying up irrigated lands for municipal water supply.

PRINCIPLES OF DETERMINING A SOCIAL DISCOUNT RATE,
Rutgers - The State Univ., New Brunswick, N. J. Water Resources Research Inst.
W. Whipple, Jr.
Water Resources Bulletin, Vol 11, No 4, p 811-819, August 1975. 2 fig, 20 ref. OWRT A-048-NJ(1).

Descriptors: Cost-benefit analysis, *Interest, *Discount rate, Economics, Risks, Taxes, Infla-

tion(Economic), Government supports, Cost analysis, US Water Resources Council.
Identifiers: *Opportunity cost theory.

An analysis is made of theories of determining government interest and discount rates. It is found that generally favored opportunity cost theories must now be reconsidered in the light of the chronic currency depreciation of the present era, and a less optimistic viewpoint as to the future. On account of our tax structure, the reconciliation between alternative theories depends upon the social evaluation of the corporate income tax. If this tax is construed as being socially desirable, it seems that our current discount rates should be reduced to perhaps 5%, as long as future benefits are to be evaluated in terms of present day prices.

Identifiers: *Tucson basin(Ariz).

Man-made water demands for urban use, crop cultivation and industrial activitity can disrupt the rainfall runoff supply of water, causing shortages. If the supply of water is not completely renewable, today's consumption impinges on the amount available in the future. A low price encourages consumption. This article discusses rational water pricing and the problem of allocating water efficiently in the Tucson Basin. Any solution to the problem will require better public understanding and some type of water conservation. The city of Tucson, agriculture, and copper mines all share the water available in the Basin, so that control of all three user types is required. It is concluded that it is cheaper to conserve water than report it from other areas, that water is seriously underpriced in Tucson, and there should be an increase in water rates. Scarcity pricing will discourage urban growth, industrial use and crop cultivation, but crop cultivation will be affected most severely. (Jamail-Arizona)

PRICING URBAN WATER,
Arizona Univ., Tucson. Coll. of Business and Public Administration.
J. T. Wenders
Arizona Review, Vol. 25, No. 10, p 13-21, October, 1976. 1 fig, 12 ref.

Descriptors: *Water demand, *Water rates, *Water supply, *Water policy, *Water costs, Competing uses, Water allocation(Policy), Water zoning, Water shortage, Water users, Water resources development, Water management(Applied), Water consumption, *Arizona.
Identifiers: *Tucson(Ariz).

Water demand, rates, cost allocation and overall water policy in Tucson are evaluated. The term water 'needs' implies that there are no trade-offs between water and other resources. It is contended that if water were delivered at a higher price, then people would be more concerned with conservation. The optimal level of water usage and peak and off-peak incremental costs are discussed. The authors argue against political rate making and in favor of peak load pricing that would charge higher rates for water used during the peak times of the year and of the day. It is concluded that (1) a scarcity price must be set on water and charged in addition to delivery costs; (2) seasonal, lifting, and distance price differentials based upon incremental costs must be established, and (3) the public has become accustomed to water rates which have been too low. ENERGY FROM COAL.
Tetra Tech, Inc., Arlington, Va.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $2.05. Report No. ERDA 76-67, 1976. 124 p, 39 fig, 3 tab, 159 ref. E(49-18)-2225.

Descriptors: *Energy, *Coals, Bibliographies, Economics, Social aspects, Legislation, Coal mines, Coal mine wastes, Land reclamation, Mining, Transportation, Reviews
Identifiers: Coal gasification, Coal liquefaction, Coal preparation

An overview of coal as an energy source is presented. Major aspects considered were: coal

pply and demand, classification of coal, mining chnology including land reclamation, coal transrtation and storage, coal preparation, coal ocess technology, economic considerations, and gislative policy. Short bibliographies follow scussion of each aspect. While the United States s more energy available in the form of coal than the combined resources of petroleum, natural s, oil shale, and tar sands, this solid fuel can curntly be applied to only a limited portion of the tal national energy demand; primarily that of the ectric utilities. Consequently, converting coal to seous and liquid fuels in commercial quantities necessary in order to make it available to energy ers in the transportation, household, and comercial sectors. Coal gasification and liquefaction ocesses are emphasized in the report. Progress resolving technical and social problems related the use of coal, such as land reclamation of ined land and health hazards, is described. Lack sufficient capital and the related concerns of anpower, equipment, and transportation is a rious constraint on expansion of the industry's arket. (Luedtke-Wisconsin)

entifiers: Central Arizona Project.

e relationship between law and hydrology in ter resources development is discussed. Law atnpts to allocate a limited and valuable resource ile hydrology tries to define the limits of the ource. In the past an inadequate data base has de hydrologic estimates difficult and political tors pushed the law into possibly conflicting nmitments in the Colorado River Basin. The ter allocation process and the role of hydrology lefining the risk of deficiency are described and istorical overview of the interaction between and hydrology is presented. Using tree-ring earch, hydrologists have produced a more inite data base and thus given legal policy kers more reliable information. As developnt approaches the resource limit in the Upper lorado River Basin, lawyers and hydrologists st act in concert toward the equitable solution allocation and reallocation problems. (Jamailzona)

INTERNATIONAL SEABED REGIME: INDIA'S INTERESTS AND POLICY OPTIONS,
Lucknow Univ. (India).
M. Shyam, and S. Sunder.
Indian Political Science Review, Vol. 10, No. 1, p. 1-18, 1976.

Descriptors: *Law of the sea, *Oceans, *Mining, *India, Copper, Nickel, Regulation, Cobalt, Manganese, International waters, International law, Governments, Jurisdiction, Economic impact.
Identifiers: *Seabed mining, *Manganese nodules.

India's alternatives with respect to the development of a regime to govern the exploitation of the seabed resources beyond national jurisdictions are discussed, taking into account potential future discoveries and technological breakthroughs as well as known resources. Manganese nodules, containing copper, nickel, cobalt, and possible manganese, are the most promising known resources of the seabed. India's manganese exports are likely to be hurt by seabed production but India may benefit from lower prices of copper, nickel, and cobalt. Besides these direct economic effects, India's policy toward a new seabed regime should consider such factors as preventing of a new form of colonial competition over the seabed, Indian access to seabed technology and research results, securement of her fair share of the wealth of the seas, and prevention of ecological damage to the oceans. Examination of three major policy options indicates that a strong international agency with regulatory authority would best suit India's interests, as opposed to a continuation of the status quo (no international agency) or establishment of a weak agency restricted to registry functions. MINNESOTA WATER RESOURCES BOARD AND WATERSHED DISTRICTS.
Minnesota Water Resources Board, St. Paul.
Legislative Report 1974. 48 p. 2 fig, 6 append.

Descriptors: *Minnesota, *Watershed management, *State governments, *Legislation, Judicial decisions, Local governments, Water management(Applied), Costs, Water resources development.
Identifiers: *Watershed districts, Minnesota Watershed Act, Minnesota Water Resources Board.

The course of Minnesota water resources management activities under the auspices of that state's Water Resources Board and the Watershed Act is summarized. Minnesota Statutes, Sections 105.71-105.79 and 112.34-112.86 (1955, 1975) called for the establishment of individual watersheds with authority vested in local units, and created the Water Resources Board to perform as a quasi-judicial body for the establishment and general supervision of the watershed districts as well as resolving water policy questions between state departments or individuals and a state department. By 1973, 34 watershed districts were established, and the constitutionality of the Act as well as Board decisions have been affirmed in court. A tabulation of these judicial decisions is appended. Brief summaries of each of the 34 water district's problems and projects are included, along with a cost breakdown of individual projects or improvements. Overall, a grand total of $64,676,974 has been expended, over 80% of which has come from federal sources. It is concluded that this system is accomplishing its legislative intent, but that the procedure for resolving conflicts is underutilized because agencies and individuals seem unaware of the opportunities provided by the legislation. 6F. Nonstructural Alternatives

THE FLOOD DISASTER PROTECTION ACT OF 1973,
Pennsylvania State Univ., University Park. Dept. of Business Law.
B. L. Myers.
American Business Law Journal, Vol 13, p 315-333, 1976. 17 ref.

Descriptors: *Flood plain insurance, *Flood plain zoning, Non-structural alternatives, Flood protection, Floodproofing, Land use, Building codes, Design standards, Regulation, Federal government, Local governments, Legislation, Insurance, Costs, Compensation.
Identifiers: *Flood Disaster Protection Act of 1973.

The background, requirements and implications of the Flood Disaster Protection Act of 1973, the latest amendment to the National Flood Insurance Act of 1968, are discussed. Basically the 1973 amendment is an attempt to overcome the problems posed in the 1968 Act by: (1) substantially increasing the limits of flood insurance coverage available to property owners, (2) rapidly identifying all flood-prone communities and requiring them to participate in the flood insurance program, and (3) requiring virtually all new construction and new property owners in flood zones to be covered by flood insurance. It requires flood insurance as a prerequisite to obtaining federal mortgage money or mortgage money from a federally insured or related lending institution. As such, it will likely establish a new vista in federal land use control, by bringing nearly seven per cent of the land in the United States under federal regulations. If a community refuses to participate in the HUD administered program, virtually all sources of funds for flood plain development would be eliminated, present owners will be unable to purchase insurance, but the federal government will continue to provide disaster relief. If a community participates, all structures in the flood plain would be elevated above the 100-year flood level or floodproofed to that level. (Luedtke-Wisconsin)

WATER USE IMPLICATIONS FOR NUCLEAR POWER STATIONS IN THE UNITED STATES OF AMERICA,
Columbia Univ., New York.
G. J. Halasi-Kun.
Nordic Hydrology, Vol. 6, No. 1, p 1-13, 1975. 6 fig, 1 tab, 12 ref.

Descriptors: *Nuclear powerplants, *Water requirements, *Water consumption(Except consumptive use), *Water demand, *Thermal pollution, Nuclear energy, Water utilization, Nuclear reactors, Water cooling, Environmental effects, Water pollution, Heated water, Water pollution sources, Water temperature, Water supply, Available water, Cooling towers, United States.

The location of nuclear powerplants must be considered in relation to their total environment. The problems in selecting reactor sites are discussed in terms of population density, coolant water demand, thermal pollution, and engineered safeguard measures during construction and operation. The coolant water demand is a major problem in selecting a reactor site. The critical period for water consumption is the late, hot summer. This generally coincides with the lowest surface flow and the highest period of fresh water demand. Because of the possibility of water shortages in some areas of the United States, especially in arid areas, increasing consideration is being given to the use of dry cooling towers for waste rejection and to improving efficiency of existing and planned reactors. A COMPUTERIZED INFORMATION SYSTEM ON THE IMPACTS OF COAL-FIRED ENERGY DEVELOPMENT IN THE SOUTHWEST,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. W. Layton.
Ph.D. Dissertation, 1975. 108 p, 3 fig, 15 tab, 4 append.

Descriptors: *Computer programs, *Data processing, *Electric power production, *Southwest US, Environmental effects, Data storage and retrieval, Systems analysis, Computers.

Research was conducted on the development and evaluation of a computerized information system designed to selectively transfer data on the individual and cumulative impacts of several electric generating facilities in the southwestern United States. Primary impacts considered by the Four Corners Program, of which this system was a part, include those on surface water and groundwater. This system incorporates elements of management and environmental information systems and an issue-oriented system developed at the University of Illinois, thus providing the capacity for communicating impact information derived from various sources. The system can retrieve textual material stored in a base information file or execute on-line simulation models and routines in order to describe environmental impacts. The acquisition and communication of environmental impact information is discussed, and the hybrid system's design and development outlined. Evaluation was conducted by demonstrating the system to prospective users from electrical utilities, government agencies and members of the public in Arizona. Results indicate that this technology is a viable means of transmitting environmental information and that its usefulness is likely to depend more on credibility than convenience. (Jahns-Arizona)

ENERGY DEVELOPMENT: THE ENVIRONMENTAL TRADEOFFS. VOL. 2: RELATIVE ENVIRONMENTAL ASSESSMENT OF METHODS TO INCREASE ENERGY PRODUCTION, CRUDE OIL, PIPELINE QUALITY GAS, AND ELECTRICITY FROM WESTERN COAL,
Stanford Research Inst., Menlo Park, Calif.
M. D. Levine, and R. V. Steele.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-250 001, Price codes: A07 in paper copy, A01 in microfiche. Report October 1975. 125 p. 3 fig, 28 tab, 55 ref. 68-01-2469.

Descriptors: *Alternative planning, *Decision making, *Energy conversion, *Evaluation, *Environmental effects, Air pollution, Natural gas, Water quality, Oil fields, Land use, Social impact, Public health, Aesthetics, Water consumption, Electric power production, Coals, Oil shales, Fossil fuels.
Identifiers: *Energy production, *Environmental tradeoffs, *Environmental impacts, Coal liquefaction, Coal gasification.

The relative environmental tradeoffs among each of three sets of options for increasing energy production are analyzed. Environmental indicators used in the analysis include sulfur dioxide, nitrogen oxides, and particulate impacts on air quality, public health, aesthetics, land use, water consumption relative to availability, and water quality. Results indicate that options for development and use of Western coal for electricity generation reflect the following: (1) low-Btu gasification/combined-cycle electricity generation is less environmentally damaging than steam electricity generation, (2) the critical tradeoffs between steam generation in the West and in the Midwest are the adverse social impacts, high water consumption and potential degradation of clean air in the West versus high levels of air pollution near populated areas in the Midwest, and (3) low-Btu gasification/combined-cycle electricity generation in the Midwest has significantly lower social and water consumption impacts than the same technology in the West. Tradeoffs among seven measures for increasing domestic oil production, and among four options for increasing pipeline quality gas supplies were also analyzed. It was concluded that the use of miscellar flood techniques of assisted recovery pose the least adverse environmental risks and oil shale development the greatest risks among the choices for crude oil supplies, and gasification of midwestern coal and production of gas from Atlantic and southern Caifornia OCS were the most favorable options for gas supplies. ATLANTIC OFFSHORE OIL: THE NEED FOR PLANNING AND REGULATION,
Woods Hole Oceanographic Institution, Mass Marine Policy and Ocean Management Program.
J. M. Friedman.
Oceanus, Vol 19, No 1, p 22-37, 1975. 3 fig.

Descriptors: *Planning, *Regulation, *New England, *Oil fields, *Continental Shelf, Regional development, Social impact, Economic impact, Federal jurisdiction, State jurisdiction, Leases, Oil industry, Offshore platforms, Oil spills, Coasts, Atlantic Ocean.
Identifiers: *Onshore impact, *Offshore oil fields, Outer Continental Shelf Land Act, Coastal Zone Management Act, Georges Bank.

The legal-administrative structure for offshore oil development particularly as it affects the New England states through development of the George Bank area is discussed. The basic framework for offshore oil development was established by the 1953 Outer Continental Shelf Land Act which gave administrative authority to the Secretary of the Interior who in turn delegated this authority to the Bureau of Land Management (BLM) for leasing of offshore tracts, and to the U.S. Geological Survey (USGS) for regulation of offshore operations. Federal authority for offshore authorization and regulation was sustained by the 1975 case of the United States vs. Maine. During this same period however, growing public awareness of the environmental costs of unplanned development has led to the enactment of a number of antipollution laws. The most significant for the administrative legal framework of offshore oil development is the Coastal Zone Management Act which provides a mechanism for coordinating federal and state programs and recognizes that the protection of coastal resources is best achieved through strong local and state participation. To date, BLM and USGS reliance on oil company opinion and expertise has led to poor federal-state relations and hampered effective socio-economic and environmental planning, which is necessary to regulate both pollution and onshore impacts of offshore oil development. Parallels between North Sea development by Scotland and Norway and the New England situation are also suggested. (Luedtke-Wisconsin)

A SIMPLE APPARATUS FOR METERING VOLATILE LIQUIDS INTO WATER,
National Marine Fisheries Service, Tiburon, Calif. Tiburon Fisheries Lab.
P. E. Benville, Jr., and S. Korn.
J Fish Res Board Can. 31(3), p 367-368, 1974.

Descriptors: *Measurement, *Volatility, *Gases, Equipment, Instrumentation, Organic compounds, Aromatic compounds.
Identifiers: *Benzene, *Toluene, *Xylene, *Methylbenzene.

A metering device was developed to introduce benzene, toluene, xylene, and 1,2,4, trimethylbenzene vapors into water using air as a carrier gas. Setting the carrier gas flows for the respective aromatics at 10, 25, 120, and 500 cm3/min for 2 h resulted in concentrations of 8.2, 13.0, 12.0, and 7.2 micro-1/1, respectively, in 4 1 of water. The aromatic concentrations were maintained in a static system by bubbling air through the water, and in a continuous flow system by replenishing the water. In static systems the respective aromatic concentrations were maintained for 4 days within the ranges of 13-14, 5.1-7.0, 0.40-0.50, and 0.018-0.028 micro-1/1 by bubbling the aromatics into the water at 5 cm3/min and independently aerating the water at 100 cm3/min. In a 14-day continuous flow system benzene concentrations ranged from 2.1-2.8 micro-1/1 when benzene was bubbling at 23 cm3/min and water was flowing at 1.8 1/min.--Copyright 1974, Biological Abstracts, Inc.

SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART 1. NORTH ATLANTIC SLOPE BASINS--VOLUME 3. BASINS FROM MARYLAND TO YORK RIVER.
Geological Survey, Reston, Va. Water Resources Div.
Available from Branch of Distribution, USGS, 1200 S. Eades St., Arlington, VA, 22202, price $7.00. Geological Survey Water-Supply Paper 2103, 1976. 971 p, 1 fig.

Descriptors: *Hydrologic data, *Surface waters, *Streamflow, *Lakes, Delaware, Maryland, New York, Pennsylvania, Virginia, West Virginia, Basic data collections, Runoff, Discharge(Water), Gaging stations, Flow measurement, Flow rates, Reservoirs
Identifiers: *North Atlantic slope basins, Reservoir content.

This report is one of a series of 37 reports presenting records of stage and discharge of streams, and of stage and contents of lakes and reservoirs in the United States during the 1966-70 water years; it contains the records for gaging stations and partial-record stations in the North Atlantic slope basins, Maryland to York River. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum and minimum discharges. Data for partial-record stations are presented in two tables. The first is a table of discharge measurements at low-flow partial-record stations, and the second is a table of annual maximum stage and discharge at crest-stage stations. Occasionally, a series of discharge measurements are made within a short time period to investigate the seepage gains or losses along a reach of a stream or to determine the low-flow characteristics of an area. Such measurements are given in special tables. For a lake or reservoir station, capacity tables giving the contents for an stage are prepared from stage-area relation curves defined by surveys. The application of the stage to the capacity table gives the contents, from which the daily, monthly, or yearly change in contents is computed. (Woodard-USGS)

THE MERIDIAN-UPPER WILCOX AQUIFER I MISSISSIPPI,
Geological Survey, Jackson, Miss. Water Resources Div.
E. H. Boswell.
Water-Resources Investigations 76-79 (open-file report), June 1976. 3 sheets, 19 fig, 3 tab, 17 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water yield, *Water quality, *Mississippi, Hydrologic data, Water well, Pumping, Hydrogeology, Drawdown, Groundwater recharge, Water utilization, Water supply, *Maps
Identifiers: *Wilcox Group, Tallahatta Formation

The Meridian-upper Wilcox aquifer contains freshwater in a 15,000 sq mi area in northwestern and central Mississippi. The aquifer comprises the Meridian Sand Member of the Tallahatta Formation and discontinuous hydraulically connected sand beds in the upper part of the Wilcox Group. The aggregate sand thickness of the aquifer ranges from less than 50 ft to about 500 ft. The withdrawal of fresh water from the aquifer in Mississippi in 1975 was about 32 Mgal/d. Long-term water-level trends indicate an average decline of about 1 ft per year. Thick, permeable sand beds yield as much as 2,800 gal/min to wells and fresh water extends to depths of more than 2,000 ft. The aquifer is used extensively in areas where the dissolved-solids content exceeds 500 mg/liter, however, the most common problems in water supplies are excessive iron and corrosiveness. (Woodard-USGS)

NATIONAL ENVIRONMENTAL STATISTICAL REPORT,
Mitre Corp., McLean, Va.
Duncan, D. Elcock, and G. Hollins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 233, Price codes: A12 in paper copy, A01 in microfiche. Technical Report MTR-6957, October 1975. 265 p. 30 tab. 2930. CEQ F 19628-76-C-0001.

Descriptors: *Data collections, *Statistics, Air pollution, *Water quality, Land use, Solid wastes, Recycling, Pesticides, Toxicity, Agriculture, Forests, Wildlife, Food abundance, Water sources, Recreation, Energy, Mineralogy, Transportation, Human population, Economics, Water pollution.
Identifiers: *Environmental quality, Demography, Housing, Environmental impact statements, Noise pollution.

A variety of environmental and related data available as of May 1975 from various sources are presented in approximately 200 statistical and summary tables. Three kinds of general data categories are included: (1) basic environmental categories, (2) categories which provide data directly related to environmental quality, and (3) data categories which are frequently compared to or used in the analysis of environmental data. The tables are arranged by data type under 16 subject categories. These are: air quality, water quality, land use, solid waste and recycling, pesticides and toxic substances, agriculture and food supply, forests and wildlife, water resources, recreation, minerals, energy, transportation, housing, demography, economics, and environmental impact statements. In order to ensure continuity between this publication and future updates, data which are collected and updated on a regular basis were selected. All 50 states and the District of Columbia are represented by the data, as well as a few tables of international data to give perspective to the United States data. A comprehensive index facilitates the identification of data. (Luedtke-Wisconsin)

RETRANSMISSION OF HYDROMETRIC DATA IN CANADA,
Department of the Environment, Ottawa (Ontario). Applied Hydrology Div.
R. A. Halliday.
Report NASA-CR-146322, Quarterly Report SR 28190, January 1976. 7 p, 1 fig, 2 tab.

Descriptors: *Satellites(Artificial), *Meteorological data, *Canada, Hydrologic data, Water resources, Flood forecasting, Water levels, On-site data collections, Inflow, Data collections, Computers.
Identifiers: *Data collection platforms, *LANDSAT, Hydrometric data, Test site, Solar panel, Retransmission.

Data collection platforms (DCPs) had been installed at 17 sites in remote areas of Canada for transmittal of water level and other water resources data. The near real time data were used for water management purposes. The system met all requirements, and the suitability of satellite retransmission was demonstrated. Capital costs of the equipment installed at gaging stations were reasonable, and indications were that the DCPs did not require much maintenance. The potential impact of this technology on water resources data gathering activities was thought to be considerable. It was concluded that more work with quasi-operational programs is needed to determine the benefits precisely. (Roberts-ISWS)

TANKS OF PANEL CONSTRUCTION.
Water and Waste Treatment, Vol. 19, No. 7, p 26, July, 1976.

Descriptors: *Sewage treatment, *Aeration, Equipment, *Construction, Materials, Materials engineering, Waste water treatment.
Identifiers: Clarification tanks, *Aeration tanks.

A Diapac sewage treatment unit constructed of modular tank panels is described. The Diapac unit consists of two tanks, each designed for both aeration and clarification. Since tank construction is based on the use of modular tank panels which are prefabricated and produced in standard size, erection of the tanks consists of a simple bolting up and sealing operation. The tanks can also be taken down and installed at another site with relative ease. (Kreager-FIRL)

Identifiers: *Free stream turbulence, Contraction coefficient, Vena contracta.

It is commonly believed that behavior of most free surface hydraulic models is adequately described by the Froude Law if Reynolds number exceeds a

U. OF I. URBANA-LIBRARY

certain minimum value. However, free stream or grid turbulence may cause apparent scale effects that are even greater than the viscous effects. The higher turbulence levels in the model can result in excessive momentum transfer in zones of highly curvilinear flow. A laboratory model was constructed to obtain a correlation between the free stream turbulence levels and the measured contraction coefficient below sharp-edged sluice gates. The experimental studies indicated that (1) the free stream turbulence can significantly increase the vena contracta in sluice gate models, (2) the flat plate boundary layer displacement theory is not sufficient to explain the discrepancies between the experimental and theoretical values of the coefficient of contraction, (3) the kinematic viscosity model gives a reasonable explanation for the turbulence effect on the coefficient of contraction, and (4) further research is needed to assess the effect of air entrapment on the vena contracta. ON THE RELIABILITY OF THE SPECTRAL METHOD FOR THE DESIGN OF OFFSHORE STRUCTURES,
Technische Universitaet, Munich (West Germany). Institut fuer Bauinzenieurwesen III.
G. I. Schueller.
Journal of Hydraulic Research, Vol. 14, No. 3, p 229-240, 1976. 4 fig, 3 tab, 20 ref, 1 append.

Descriptors: *Offshore platforms, *Waves(Water), *Tsunamis, *Wind tides, *Time series analysis, Mathematics, Coastal structures, Statistical methods, Loads(Forces), Ocean waves, Filters.
Identifiers: *Spectral method, Dynamic amplification factor, Wave force.

Spectral analysis is a useful tool for the design of structures subject to time-dependent stochastic loading as exerted by wind-generated water surface waves. Two major uncertainties have to be considered: the variation of the wave height spectrum given a time history of a water surface measured at a fixed point, and the dispersion of the wave force spectrum given the wave height spectrum. The second uncertainty and its influence on the dynamic amplification factor were discussed in this paper. The size of resolution and degree of confidence of spectral estimates as well as the filtering process were found to be important for the spectral shape, particularly in the subrange significant for structural design of dynamically excited linear systems. The coefficients of drag and inertia are radom variables. The effect of their dispersion on the variation of the force spectral estimate in terms of exceedance probabilities of the dynamic wave loads - using similarity wave height spectra - was discussed. The analysis was illustrated utilizing a template steel platform in 550 feet of water as a sample structure. (Singh - ISWS)

FLOW CONTROL AND TRANSIENTS IN THE CALIFORNIA AQUEDUCT,
California State Dept. of Water Resources, Sacramento. Div. of Operations and Maintenance.
H. G. Dewey, Jr, and W. R. Madsen.
Journal of the Irrigation and Drainage Division, American Society of Civil Engineers, Vol. 102, No. IR3, Proceedings Paper 12434, p 335-348, September 1976. 10 fig, 1 tab, 2 ref, 1 append.

Descriptors: *California, *Control systems, *Flow control, *Gates, Water supply, Aqueducts, Hydraulics, Operations, Water conservation, Water distribution(Applied), Channels, Open channels.
Identifiers: *California State Water Project, *Gate operation, Operational procedures.

From initial operation of the California Aqueduct of the California State Water Project in 1967 to the present, the method of gate operation for flow control has been modified to keep up with the changing operational demands. Initially serial gate operation was employed. Then, as operating demands increased, a new method called simultaneous gate operation which uses the controlled volume concept was implemented. As flow changes increased, still another method, known as timed gate operation which is another variation of the controlled volume concept, was initiated. This latest method satisfies all present operating requirements and is expected to meet all future operating requirements. Recent flow change tests indicated that timed gate operation will control the fluctuations within the allowable limits for flow changes up to and including designed flow quantities in the range of 13,100 cfs (370 cu m per sec). Refinement to the timed gate operation can further reduce the magnitude of hydraulic transients during major flow changes. (Lee-ISWS)

MINIMIZING COSTS IN WELL FIELD DESIGN IN RELATION TO AQUIFER MODELS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
C. A. Bostock.
Ph.D. Dissertation, 1975. 144 p, 14 fig, 48 ref, append.

Descriptors: *Cost analysis, *Water wells, *Model studies, *Aquifer management, Permeability, Pumping, Well spacing, Groundwater mining, Cost allocation.
Identifiers: *Aquifer models, *Aquifer permeability.

Well field design costs are minimized by the well density-capacity combination used to meet groundwater demand. A well design method discussed accounts for lateral variations in aquifer permeability, but not water benefits or transmission lines for water and power. All wells are equally spaced in a grid pattern and have the same design. Cost determination and distribution are discussed. The aquifer selected to demonstrate this method is unconfined and, except for permeability, is uniform laterally. Groundwater mining occurs during the annual pumping season. The method is defined and illustrated using the assumption of a homogeneous aquifer, with all wells operating simultaneously at equal discharge rates. The influence of nonuniform permeability is analyzed, along with inter-cell flow effects due to possible distributions of heterogeneous permeability and non-simultaneous pumping. The method described for illustration is considered applicable to aquifer and climatic conditions like those in Bangladesh. Equations are given for estimating errors associated with approximating the boundary shapes of hexagonal, square and equilateral cells by a circle of equal area. (Jahns-Arizona)

THE DESIGN AND TEST OF A SAFE AND EFFECTIVE STORM-SEWER INLET,
Kansas Water Resources Research Inst., Manhattan.
Y. S. Yu.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 345. Price codes: A04 in paper copy, A01 in microfiche. Contribution No. 183, August 1976. 42 p, 8 fig, 2 tab, 2 ref, append. OWRT A-076-KAN(1). 14-34-0001-6017

Descriptors: *Design *Testing, Storm water, *Storm drains, *Intakes, Interceptor sewers, Drains, Slopes, Road design, *Sewers
Identifiers: Grates, Curbs, Scale models.

A new combination inlet for storm water was designed and tested on a 1:4 scale model to determine its hydraulic efficiency. Experimental results obtained from two transverse slopes, 1/48 and 1/32, and seven longitudinal slopes equal to 0.006, 0.01, 0.02, 0.03, 0.04, 0.06 and 0.08 shows that the new inlet maintains, relatively high intercept ratio over a wide range of these variables at low as well as high total discharges. Prototype tests are recommended to insure that this new inlet is also bicycle safe

PARTIAL WAVE DAMPING IN PNEUMATIC BREAKWATERS,
Royal Norwegian Air Force Academy, Trondheim.
I. Brevik
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY9, Proceedings Paper 12374, p 1167-1176, September 1976. 4 fig, 7 ref, 2 append.

Descriptors: *Breakwaters, *Hydraulics, *Waves(Water), *Theoretical analysis, Ocean waves, Wavelengths, Turbulence, Dispersion, Energy loss, Analytical techniques.
Identifiers: *Hydraulic breakwaters, Power consumption, Wave amplitude.

Power consumption in pneumatic (or hydraulic) breakwaters is very large if complete stopping of the oncoming waves is to be achieved. Partial damping of the oncoming waves can be attained if supplied power to pneumatic breakwaters is less. A theoretical analysis of the problem was attempted considering the available breakwater and amplification variation theories. The theory predicted no damping at all until the opposing current is sufficiently strong to give wave stopping. If the current exceeds the breaking limit, it was found convenient to divide the whole breakwater into three distinct regions. Reasonable agreement with the large-scale pneumatic experiments of Bulson was obtained. (Singh-ISWS)

escriptors: *Jets, *Turbulence, *Shear stress, Hydrodynamics, *Momentum transfer, Pressure, Nozzles, Potential flow, Model studies, nalytical techniques, Reynolds number.
dentifiers: *Oblique impingement, Static pres-ire, Wall pressure.

Vall pressure and shear stress in the impingement egion were studied experimentally, and semi-em-irical methods for their prediction were eveloped. The solutions of the corresponding otential flow problem were used to obtain atisfactory estimates of the eccentricity of the agnation point. The similarity analysis of the assical wall jet was employed for the wall jet re-on. Analytical results were substantiated using xisting data. The local skin friction factor was nown to be independent of impingement height nd angle but to decrease as the -1/5 power of the t Reynolds number. The wall jet thickness grows nearly at a slope that depends slightly on the eynolds number. For Reynolds numbers over 0,000, the maximum wall jet velocity decreases the inverse square root of distance and is inde-ndent of the impingement height. The effect of e impingement angle on the velocity was evalu-ed using the momentum equation and a potential ow analogy. (Singh-ISWS)

criptors: *Currents(Water), *Waves(Water), aches, *Breakwaters, Refraction(Water waves), Coasts, Shores, Model studies, Numerical analysis, Mathematical models, Ocean waves, Water circulation, Estuaries, Oceanography.
Identifiers: *Wave diffraction.

A semi-empirical theory of breaking-induced mean currents on a beach was developed to study the combined effects of refraction and diffraction. With the omission of convective inertia and lateral turbulent diffusion, the resulting averaged equations were solved by finite differences. The case of an offshore breakwater was studied in detail, and the predicted current pattern was found to be consistent with laboratory observations and the known tendency of tombolo formation near sandy beaches. Numerical results for an isolated breakwater extending from the shore were also presented, and observational evidences cited. (See also W77-02474) (Sims-ISWS)

Available from the National Technical Information Service, Springfield, VA 22161 as ADA-021 768, Price codes: A02 in paper copy, A01 in microfiche. Cold Regions Research and Engineering Laboratory Special Report 239, December 1975. 17 p, 9 fig, 3 tab, 4 ref.

Descriptors: *Locks, *Deicers, *Jets, *Ice, Nozzles, High pressure, Water, Hydraulics, Structures, Operation and maintenance, Maintenance costs, Equipment, Navigation, Ships, Channels.
Identifiers: *Ice removal, Ship locks, High-pressure water jets.

Tests were made to evaluate a proposed technique for removing ice from lock walls during winter navigation. The technique involved use of a high-pressure water jet to slice through ice collars that adhere to vertical walls. The test equipment consisted of (1) a jet lance tipped with a nozzle designed to produce a long coherent jet, (2) a small tractor (hydraulically driven) to carry the lance, and (3) a high-pressure pump unit to supply water to the lance. Tests were made with operating pressures from 3,000 to 14,000 lbf/sq in and nozzle diameters from 0.063 to 0.152 in. Most of the work involved pressures around 9000 lbf/sq in and nozzle diameters of approximately 0.09 in. Traverse speeds were in the range 3 to 17 ft/min. Jet penetrations of up to 4 ft were achieved in a single pass, and the equipment proved capable of cleaning the lock wall under the prevailing conditions. However, performance was somewhat less favorable than had been predicted, and a revised scheme involving changes in lock operating procedures was proposed. (Sims-ISWS)

CONSTRUCTION OF GOSCOTE SEWAGE PUMPING STATION,
M. L. Cooper.
Proceedings of the Institution of Civil Engineers, Vol. 60, Part 1, p 345-365, August, 1976. 16 fig, 3 tab, 8 ref.

Descriptors: *Sewage treatment, *Pumping plants, *Construction, *Structural design, *Concrete structures, Design criteria, Treatment facilities, Materials.

The construction of a substructure for a raw sewage pumping station in Great Britain is described. The substructure consisted of a circular cofferdam (38 m in diameter and 15 m deep). The notable feature of the substructure was the employment for the first time at such a large scale of a precast concrete bolted segmental lining. Although the circular cofferdam had the disadvantage of requiring a relatively large amount of over-excavation and backfilling, it had the overwhelming advantage of providing an unobstructed working space. Specific details of the design and construction of the cofferdam are presented. (Kreager-FIRL)

ALARM SYSTEM CONTINUALLY MONITORS PLANT FUNCTIONS,
A. Hartenstein.
Public Works, Vol. 107, No. 9, p 86, September, 1976.

Descriptors: *Monitoring, *Treatment facilities, *Automation, *Failures, *Computers, Waste water treatment, Water treatment, Pumping plants, Costs.

An alarm system for continuously monitoring the functions of water and waste water treatment plants as well as pumping stations is described. During normal working hours, the alarm system is activated by a master control panel and dials a designated telephone number for the reporting of alarm conditions. Should a malfunction occur, one of 18 radio-equipped trucks will respond to the alarm. During non-working hours, the monitoring system activates a computer connection with the telephone company which automatically forwards the original call to a second telephone number via a telephone call diverter so that standby personnel who are available on a 24-hour basis can respond to the alarm. Functions that can be tied into the system include: low dissolved oxygen, high

U. OF I. URBANA-CHAMPAIGN

suspended solids, low chlorine residual, chlorine leaks, power failures, low pressure, and loss of air to a waste water treatment plants. The one-time charge for installing the system averages out to $1750 per installation with a monthly charge of $39.00 for telephone equipment. (Kreager-FIRL)

Descriptors: *Mine wastes, *Dams, *Spoil banks, Seepage, Stability, Dam failure, Mining engineering, Soil mechanics, Finite element analysis, Computer models, Model studies, Strength of materials, Soil strength, Soil physics, Engineering.

Seepage forces computed by a finite-element flow program were combined with gravity forces in an elastic-plastic stress-analysis program to determine the stability of mine-waste slopes. Computer output provided a cross-sectional plot of the dam or embankment showing the safety factors for each element. The combined finite-element program called SEEP-SLOPE was used to analyze several trial embankments and the 1972 Buffalo Creek Dam failure. Safety factors computed by the finite-element method (FEM) were compared with those computed by the Bishop limiting-equilibrium method. For individual slip circles, there was little correlation between the factors of safety computed by the two methods. Both predicted failure, but FEM shows a different mode of failure plus development of potential failure zones not indicated by conventional methods. Besides having a better theoretical basis than the Bishop method, FEM requires no assumptions regarding the location or geometry of the failure surface. As a result, the program will show progressive development of a failure zone, and areas can be pinpointed where remedial measures should be taken. In addition, nonhomogeneous cross sections can be analyzed, and zones of potential piping can be defined. (Sims-ISWS)

THURROCK BEATS PEAT WITH PILED PIPES,
B. Appleton.
New Civil Engineer, Vol. 19, No. 207, p 24, August, 1976.

Descriptors: *Sewers, *Construction, *Design criteria, *Peat, *Piles(Foundation), Hydraulic structures, Conveyance structures, Foundation failure, Foundations, Pipes, Geology, Conduits.

The installation of new sewers supported by piles in an area where old sewers were adversely affected by peat layers up to 11 meters deep which overlay weathered chalk is described. Piling was decided upon since any form of conventional bedding would eventually settle unevenly as the peat alternately swelled and shrank with movements in the water table. Construction was simplified by selecting just two pile spacings (5 m and 10 m), two pipe diameters (300 mm and 450 mm), and a constant beam depth (1 m). Beam widths were 600 mm for the smaller pipe diameter and 750 mm for the larger pipes. The problem of supporting the pipe inside a reinforcement cage during concreting was solved by using a Williams form tie fastened at one end to a circular clamp around the pipe and at the other end to a worm thread adjuster clamped to a modified horizontal Acrow prop. Spaced at 1.2 m centers, the brackets allowed any deflection of the pipe to be corrected during concreting. (Kreager-FIRL)

PRECAST SEGMENTS SPEED INSTALLATION OF THUNDER BAY SEWER,
Engineering and Contract Record, Vol. 89, No. 10, p 22-23, October, 1976.

Descriptors: *Sewers, *Tunneling, *Construction, *Concrete pipes, *Hydraulic structures, Municipal wastes, Conveyance structures, Materials, Canada
Identifiers: Thunder Bay(Ont).

The use of non-reinforced precast concrete segments for an 85-inch diameter section of the Neebing-McIntyre sanitary trunk sewer in Thunder Bay, Ontario is reported. The main advantage of the system is that both the primary lining and secondary poured concrete section usually used in soft ground are replaced by a one-step installation of segments. One tunnel ring consists of four segments, each 4.33 in thick, 39.3 in long, and weighing 1000 pounds. They are erected by a mechanical arm attached to a 97-inch mole. The rate of advance is as much as 50 ft of finished tunnel per 8-hour shift. Materials handling is essentially the same as in conventional tunneling systems. One major difference is that the segments are considerably larger, and it is thus necessary to exercise greater care to ensure that they do not obstruct the tunnel passageway or foul the conveyor support assembly. FOURTH SEMIANNUAL INTERAGENCY BRIEFING, FEBRUARY 1975, WASHINGTON, D.C.,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Environmental Effects Lab.
R. T. Saucier, and M. K. Vincent.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A017 556, Price codes: A06 in paper copy, A01 in microfiche. Miscellaneous Paper D-75-14, 112 p, October 1975. 2 append.

Descriptors: *Dredging, *Coastal marshes, *Projects, *Disposal, Engineering geology, Coasts, Coastal engineering, Coastal plains, Marsh management, Marsh plants, Research and development, On-site investigations, Laboratory tests.
Identifiers: *Dredged material, Disposal operations project, Reuse research, Containment, Artificial marsh creation.

Presented are edited texts and prints of slides of the February 1975 briefing on the status of the Dredged Material Research Program (DMRP) that took place at the United States Army Engineer Waterways Experiment Station, Vicksburg, Mississippi. This was the largest and most diverse environmental research program undertaken to that time by the Corps, and it held the highest priority of any research effort at the Waterways Experiment Station. The briefing summarized the operation, organization, management, and funding of the DMRP and highlighted the issues of dredging and disposal. Research problems, accomplishments, and objectives were discussed in relation to work units within the four projects that structure the DMRP: the Aquatic Disposal Project, the Habitat Development Project, the Disposal Operations Project, and the Productive Uses Project. In February 1975, the DMRP was 40% completed with 37 work units finished and 56 active. The work unit studies, which covered a diversity of problems on the disposal, effects of disposal, and possible uses of dredged material, were conducted in laboratory and field investigations under contract with universities, corporations, and Government agencies throughout the United States. (Roberts-ISWS)

TEST NEW SEWERS WITH LOW-PRESSURE AIR,
W. S. Foster.
American City and County, Vol. 91, No. 10, p 102, October, 1976.

Descriptors: *Sewers, *Construction, *Testing procedures, *Pressure, *Hydraulic structures, Conduits, Conveyance structures, Pipes.

A low-pressure air test for determining the integrity of newly constructed sewers is described. Under the test procedure, the sewer line should be flushed and cleaned with the interior walls moist. The line should be plugged, including the laterals and outlets. Air under pressure is then introduced to a point where the pressure at the test line registers 4.0 pounds/sq in and is then allowed to stabilize until it reaches a figure of 3.5 pounds/sq in or slightly above. The pressure drop over a specified test period is then recorded; if the pressure drop more than 1 pound/sq in, the line has failed. The specified test period is determined by the following equation: test time equals (0.085 times the nominal inside pipe diameter)/permissible air loss per sq ft of internal pipe surface. The test time is established on an allowable air loss of 0.003 cu ft/min per sq ft of internal pipe surface with the following restrictions: minimum significant air loss is 2.0 cu ft/min and maximum total allowable air loss is 3.5 cu ft/min. Sewers should be air tested before and after backfill in order to assess the integrity of the installed material and the construction procedures. (Kreager-FIRL)

PLASTIC LINING OVERCOMES RUGGED TERRAIN,
Bement, Dainwood and Sturgeon, San Diego, Calif.
J. F. Dainwood.
Public Works, Vol 107, No 9, p 100-101, September, 1976.

Descriptors: *Sewers, *Repairing, *Plastic pipes, *Hydraulic structures, *Drainage systems, Conduits, Conveyance structures, Cities, Materials, Construction, Costs, California.
Identifiers: La Mesa(Calif).

The use of plastic lining to overcome exfiltration and infiltration problems associated with a 55-year-old, 6-inch concrete sewer line running through rocky terrain in the city of La Mesa, California is described. The repair project involved pulling heat-fused lengths of flexible polyethylene pipe (inside diameter of 4.75 in) through the old line. The pipe was supplied to the job-site in 38-foot sections and heat-fused in lengths necessary to extend from the lead-in pit to pull point. Lateral connections were made with polyethylene plastic saddles and jointed to the existing lateral with mechanical couplings. Manhole-main connections were made with a special grout and existing manholes were not damaged. The city elected to manage the work itself, contracting out only those portions of the project which their own forces could not handle. The final cost to complete the project was $40,000 for the 3400-foot sewer run. (Kreager-FIRL)
W77-02333

EMERGENCY REPAIR OF A DEEP STORM SEWER LINE,
D. M. Weis.
Public Works, Vol. 107, No. 9, p 76-77, September, 1976. 3 fig.

Descriptors: *Sewers, *Repairing, *Storm water, Concrete structures, *Hydraulic structures, Materials, Linings.

The emergency repair of a 60-inch monolithic concrete storm sewer in imminent danger of collapse is described. The sewer discharges into Lake Michigan, emerging from a bluff in a head wall a short distance from the shore line. A slippage had occurred along the face of the bluff about 110 ft inland from the head wall and extended laterally about 600 ft. This resulted in a shear failure in the sewer along the apparent fault line of the slippage. The existence of the fault was unsuspected until the face of the 90-foot high bluff suddenly dropped a total of 2 ft at the rate of 3-6 in/day. Temporary repair of the sewer with a 48-inch diameter, 3/8 in steel liner plate was performed. Sections of the liner were assembled on the outfall apron, attached to a cable extending through 287 ft of sewer and up to a manhole where a crane could pull the completed pipe or liner into place at the point of the break. A gap of about 1.5 in at the joint of the lapped section was closed by welding. A concrete transition section was poured to anchor the liner, and the front 20 ft was grouted with mortar. A bulkhead was made at the lake end to hold the pea gravel. The remaining annular space was filled with pea gravel or torpedo sand. (Kreager-FIRL)
W77-02350

PACKAGED PLANT FOR VIRGIN ISLANDS.
Water and Waste Treatment, Vol. 19, No. 7, p 22, July, 1976.

Descriptors: *Sewage treatment, *Treatment facilities, *Plastics, *Activated sludge, *Biological treatment, Materials, Construction, Equipment, Design criteria, Aeration, Virgin Islands.

The largest complete sewage treatment plant manufactured out of glass fiber reinforced plastics in the United Kingdom is described. The plant operates by the extended aeration activated sludge process and is capable of serving a population of 500 people. The plant is designed to treat a domestic sewage dry weather flow of 25,000 gallons/day. It consists of a rectangular glass fiber reinforced plastic tank, 11 m by 6 m by 3.5 m, divided into an aeration chamber and a settling chamber of the upward flow type. An adjustable weir controls the overflow rate in the settling chamber and ensures the quiescent conditions necessary for efficient settling. A scum removal system keeps the surface of the settling chamber free from floating solids. Particular advantages of the glass reinforced plastic construction are corrosion resistance and light weight which makes the plant easy to transport and simple to install. (Kreager-FIRL)
W77-02360

GLASS COATED STEEL TANKS.
Water and Waste Treatment, Vol. 19, No. 7, p 23, July, 1976.

Descriptors: *Storage tanks, *Waste water treatment, *Steel structures, *Coatings, *Construction, Materials, Equipment, Corrosion control.

The use of glass-coated steel plates for the construction of tanks used for the storage and treatment of water and waste water is reported. The plates are in standard sizes of 2,730 mm long by 1,445 mm high and in half plate sizes 2,730 mm long by 800 mm high. Each plate is sprayed with glass frit and fired at high temperature. The plates are lap jointed at vertical and horizontal seams with 58 mm lap at the vertical joints and 50 mm lap at the horizontal joints. All laps are sealed using a moisture curing sealant and are then bolted. The steel tanks are erected on reinforced concrete foundations. Tank sizes vary with diameters ranging from 2.558 m to over 30 m and heights ranging from 1.377 m to 11.155 m. The tanks are normally supplied open topped for effluent and water treatment, although coated steel roofs and reinforced butyl rubber debris covers can also be supplied for water and effluent storage. The tanks have a high resistance to corrosion and are simple to erect. (Kreager-FIRL)
W77-02361

SANDWICH CONSTRUCTION G.R.P.
Water and Waste Treatment, Vol. 19, No. 7, p 26, July, 1976.

Descriptors: *Plastics, *Sewage treatment, *Treatment facilities, *Equipment, *Materials, Settling basins, Construction.

The use of sandwich construction glass reinforced plastics in sewage treatment plant equipment is reported. Equipment constructed of glass reinforced plastic includes integral launders in sections fitted to form a circle within final settling tanks as well as similar launders installed in thickening tanks. Glass reinforced plastic offers the advantages of increased strength and a smooth surface which minimizes algal growth. The material is also non-corrosive. (Kreager-FIRL)

WATER RESOURCE PROBLEMS AND RESEARCH NEEDS OF NORTH CAROLINA,
North Carolina Water Resources Research Inst., Raleigh.
D. H. Howells.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 475, Price codes: A03 in paper copy, A01 in microfiche. Report No. 2 (Revised 7/1/76), July 1, 1976, 39 p. OWRT A-999-NC(49), 14-34-0001-6034.

Descriptors: *Research priorities, Water resources, Conservation, Planning, Pollution abatement, Groundwater, Surface water, *Research and development, *North Carolina, *Education, Training, Colleges, *Universities, Government support, State governments.
Identifiers: *Water resource problems, *Water resource research needs.

A summary of North Carolina's water resource problems and research needs was prepared as a source of orientation for the North Carolina Water Resources Research Institute's research program. The subject matter is presented within the broad categories of water resource planning, water quality management, and water quantity management. The problems and needs discussed represent those areas in which the Institute is attempting to encourage a research response from potential investigators. Current and needed studies and research referred to reflect the collective statewide effort of public agencies, industry, and the university community. Seventy-three priority research needs are identified. (Kiger-North Carolina State)

MAINE RIVERS BIBLIOGRAPHY- A USER'S MANUAL,
Research Inst. of the Gulf of Maine, Portland.
R. Harvey, M. W. Hall, P. D. Uttormark, and M. M. Brady.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 495, Price codes: A02 in paper copy, A01 in microfiche.
Maine Land and Water Resources Institute, Orono, Completion Report, October 1976. 12 p. OWRT A-038-ME(1).

Descriptors: *Rivers, *Bibliographies, *Maine, *Streams, *Estuaries, Groundwater, Hydrology, Meteorology, Erosion, Floods, Navigation, Oceanography, Wildlife, Dams, Water supply, Water quality, Fisheries, History, Recreation, Wetlands, Geology, Soils, Dredging, Diversion.

This User's Manual is a companion volume to the Maine Rivers Bibliography and explains bibliography development, its use, and where to obtain materials once they are identified. An introductory section describes and evaluates the original project objectives and their attainment. The collection method is then explained. Accompanying tables detail accept-reject criteria and nationally available document data bases. The bibliography description covers the structure of the individual citations - author, title, source, and code sections - and how a microfiche published Keyword in Context (KWIC) Index, consisting of Keyword Index, Author Index, and Citation Section, can be used. Approximately 4500 citations are indexed. Accompanying tables detail identification codes - sector, source type, time, disciplines, locations - and give samples from the three sections of the KWIC Index. A final tabular presentation lists organizational information sources, the general kinds of information held, and the forms in which they are kept. An appendix contains technical notes on the computer program used to generate the index. The Maine Rivers Bibliography is available on microfiche for a nominal charge from the Environmental Studies Center, University of Maine at Orono.

Water Motion on a Beach in the Presence of Breakwater: 2. Mean Currents,
W77-02475

BEANS
Nutrient Dilution-Antagonism Effects in Co and Snap Beans in Relation to Rate and Sour of Applied Potassium,
W77-02288

BEAR LAKE AREA (UTAH-IDAHO)
Methods for Determining Recreational, E vironmental, and Economic Consequences Alternative Development Programs for t Bear Lake Area,
W77-02082

BEAUFORT SEA
The Barrow Submarine Canyon: A Drain f the Chukchi Sea,
W77-02481

BEAVER CREEK (ARIZ)
Woods Canyon--A Large Scale Watersh Management Experiment: An Explanation a Interim Report,
W77-02110

BED FORM GEOMETRY
Geometry of Ripples and Dunes in Alluv Channels,
W77-02130

BED LOAD
Geometry of Ripples and Dunes in Alluv Channels,
W77-02130

EDROCK
Stratigraphy of the Paleocene and Lower Part of the Eocene in Western Tennessee,
W77-02315 2F

EET SUGAR INDUSTRY
Economic Analysis of Effluent Guidelines: Beet Sugar Industry,
W77-02434 5D

ELORUSSIAN-SSR
Water Hardness and Incidence of Malignant Neoplasms Among the Population, (In Russian),
W77-02384 5F

ENTHIC FLORA
Caloric Investigations on the Shore Community of a Fish Pond, (In German),
W77-02336 2H

ENTHIC MUDS
Identification and Quantification of Water Quality Change Inducting Mechanisms in Stratified Reservoirs,
W77-02089 5C

ENTHOS
Changes in Benthos and Fishes of a Stream Accompanying a Substantial Reduction in Plant Nutrients,
W77-02191 5C

The Role of Mollusks as Benthos Components in Purification of Water Bodies from Ascaris Suum Eggs, (In Russian),
W77-02230 5G

Survey of Macroinvertebrate Communities in the Provo River and Diamond Fork Systems,
W77-02548 5C

'NZENE
Hygienic Standardization of Diethylbenzene in Water Bodies, (In Russian),
W77-02152 5G

A Simple Apparatus for Metering Volatile Liquids into Water,
W77-02454 7B

RING SEA
Spectral Characteristics of the Microwave Emission from a Wind-Driven Foam-Covered Sea,
W77-02476 2L

ce Movement and Distribution in the Bering ea from March to June 1974,
V77-02482 2C

RYLLIUM
ompilation of State Data for Eight Selected oxic Substances, Vol. 1, Final Report,
/77-02204 5G

ompilation of State Data for Eight Selected oxic Substances, Vol. IV, Compilations of ummaries and Analyses of State Data,
/77-02205 5G

LIOGRAPHIES
valuation of the Ring Oven Technique for 'ater Monitoring, Appendices,
'77-02149 5A

cid Mine Drainage (A Bibliography with Abracts),
77-02207 5G

aine Rivers Bibliography- A User's Manual,
77-02224 10C

Bibliography of Soviet Literature on Freshwater Hydrobiology and Related Problems: 1974-1975 (Issue 19), (In Russian),
W77-02232 2I

Economic Impacts of Weather Variability,
W77-02429 3B

BIO-OXIDATION
Thermophillic Bio-Oxidation of High-Strength Organic Wastewaters and Sludges,
W77-02369 5D

BIOASSAY
A Bioassay to Assess Wastewater Toxicity to Aerobic Biological Treatment,
W77-02081 5D

Nutritional Ecology of Nuisance Aquatic Plants,
W77-02451 5C

A Sensitive Algal Assay: An Improved Method for Analysis of Freshwaters,
W77-02524 5A

BIOCHEMICAL OXYGEN DEMAND
Fluid Sampler and Oxygen Meter for Sewage Processing - Biological Oxygen Demand Detailed Continuously by Reaction Vessel Read-Out.
W77-02340 5A

A Discourse on the Biochemical Oxidation of Sewage,
W77-02373 5D

Correlation of BOD, COD and Soluble Organic Carbon,
W77-02376 5A

BIOCONTROL
Use of Plant Pathogens for Bioregulation of Aquatic Macrophytes,
W77-02514 5G

Evaluation of Cercospora Rodmanii as a Biological Control of Waterhyacinths,
W77-02528 5G

Cercospora Rodmanii, A New Pathogen of Water Hyacinth with Biological Control Potential,
W77-02540 5G

Mycoleptodiscus Terrestris Leaf Spot on Waterhyacinth,
W77-02543 5G

BIODEGRADATION
Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

Thermal Effects on Biodegradation of Pollutants in Water,
W77-02218 5B

Nitrogen in the Soil Water of the Ecosystem of the Amazonian Prairies, (In Portugese),
W77-02239 5B

Degradation of NTA Acid During Anaerobic Digestion,
W77-02364 5D

Bio-Refractory Index for Organics in Water,
W77-02520 5A

C(rown) Z(ellerbach)'s Solids Waste Problems at Wauna are Reduced by Composting,
W77-02572 5E

BIOECONOMIC MODEL
A Bioeconomic Simulation Analysis of Regulating Groundwater Irrigation,
W77-02549 3F

BIOINDICATORS
Tubificids (Oligochaeta: Tubificidae) - Indicators of the Quality of Water Bodies, (In Russian),
W77-02225 5A

Biological Monitoring: Substantiation and Experience in Organization, (In Russian),
W77-02235 5A

Effect of River Pollution on Aquatic Beetles, (In Russian),
W77-02261 5A

BIOLOGICAL COMMUNITIES
Phosphate Reduction and Response of Plankton Populations in Kootenay Lake,
W77-02440 5C

BIOLOGICAL FILTERS
Theoretical Model for a Submerged Biological Filter,
W77-02385 5D

BIOLOGICAL TREATMENT
A Bioassay to Assess Wastewater Toxicity to Aerobic Biological Treatment,
W77-02081 5D

Clarification Plant,
W77-02337 5D

Coleshill Advanced Wastewater Treatment Project,
W77-02344 5D

Advanced Waste Treatment Plant has Physical-Chemical Option,
W77-02345 5D

Heavy Metals-Induced Deflocculation of Activated Sludge,
W77-02352 5D

Packaged Plant for Virgin Islands.
W77-02360 8G

Fluid-Bed Reactor May Cut Sewage Costs.
W77-02367 5D

Thermophillic Bio-Oxidation of High-Strength Organic Wastewaters and Sludges,
W77-02369 5D

A Discourse on the Biochemical Oxidation of Sewage,
W77-02373 5D

Instantaneous Metering Aids - Activated Sludge Plant,
W77-02381 5A

Theoretical Model for a Submerged Biological Filter,
W77-02385 5D

New Biological Clarifier of the Wiesloch Paper Mill of Holfelder-Werke GMBH. Und Co. KG. (Neue biologische Klaeranlage der Papierfabrik Wiesloch der Holfelder-Werke GmbH und Co. KG.),
W77-02566 5D

Environmental Protection in the Pulp and Paper Industry, Possibilities of Realization and Present State of Technology (Umweltschutz in der Zellstoff- und Papierindustrie,

Moeglichkeiten der Realisierung und heutiger Stand der Technik),
W77-02568 5D

Fixed Biological Surfaces -- Wastewater Treatment: The Rotating Biological Contractor,
W77-02571 5D

BIOTA
Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

BISCAYNE BAY (FLA)
Effects of Water Management on Fresh-Water Discharge to Biscayne Bay,
W77-02314 4A

BITTERROOT VALLEY (MONT)
Geophysical Study of the Waterbearing Strata in Bitterroot Valley, Montana,
W77-02085 2F

BLACK SEA
Hygienic Aspects of a Study of Bdellovibrio Bacteriovorus as a Natural Factor of Self-Purification of Water Bodies, (In Russian),
W77-02243 5C

BLEACHING WASTES
Chlorides in the Kraft Recovery System. I. Chlorides in the Recovery Boiler, and a Mechanism for Chloride Removal,
W77-02559 5D

Chlorides in the Kraft Recovery System. II. Process and Equipment Aspects on a Closed Bleached Kraft Mill,
W77-02560 5D

Effluent-Free Bleached Kraft Pulp Mill. VIII. Bleach Plant Renovation and Design,
W77-02562 5D

Investigations of Effluent Characteristics from Conventional and Oxygen Bleaching Sequences: Results of Laboratory Studies,
W77-02563 5D

BLOWOUTS
Water Flow in Glaciers: Jokulhlaups, Tunnels and Veins,
W77-02458 2C

BOATS
Analysis of Pollution from Marine Engines and Effects on the Environment. Summary Report.
W77-02449 5C

BORON
Effect of Lime on Boron Transport to and Uptake by Cotton,
W77-02282 3F

Toxicity, Uptake and Survey Studies of Boron in the Marine Environment,
W77-02565 5C

BOTTOM SEDIMENTS
The Effect of Bottom Sediments on Formation of Surface Water Composition, (In Russian),
W77-02259 5B

BOUGUER ANOMALY
Geophysical Study of the Waterbearing Strata in Bitterroot Valley, Montana,
W77-02085 2F

BOUNDARY LAYERS
Measurements of the Turbulent Boundary Layer Under Pack Ice,
W77-02138 2C

BOUSSINESQ EQUATION
Numerical Solution of Boussinesq Equation,
W77-02143 2F

BRAZIL
Nitrogen in the Soil Water of the Ecosystem of the Amazonian Prairies, (In Portugese),
W77-02239 5B

BRAZILIAN SOILS
Sulfur Fractions and Carbon-Nitrogen-Phosphorus-Sulfur Relationships in Some Brazilian and Iowa Soils,
W77-02102 2G

BREAKWATERS
Partial Wave Damping in Pneumatic Breakwaters,
W77-02455 8B

Water Motion on a Beach in the Presence of a Breakwater: 1. Waves,
W77-02474 8B

Water Motion on a Beach in the Presence of a Breakwater: 2. Mean Currents,
W77-02475 8B

BREAM
Occurrence of Kerosene-Like Hydrocarbons in the Bream, Mylio Australis Gunther,
W77-02212 5C

BROMIDES
The Use of A Specific Ion Electrode for Determination of Bromide in Soils,
W77-02100 2G

BROMINE
Aqueous Halogen Equilibria, Case I. Halogen in Pure Water,
W77-02150 5D

Direct of X-Ray Spectrometric Determination of Bromine in Water,
W77-02457 5A

BROMINE HYDROLYSIS
Aqueous Halogen Equilibria, Case I. Halogen in Pure Water,
W77-02150 5D

BULK WATER TRANSPORTATION
System for Evaluation of the Hazards of Bulk Water Transportation of Industrial Chemicals,
W77-02206 5G

CADMIUM
Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

Compilation of State Data for Eight Selected Toxic Substances, Vol. I, Final Report,
W77-02204 5G

Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

Influence of Mercury, Lead, Cadmium and Copper on Primary Production and Phytoplankton in Some Coastal Areas of the Mediterranean and Red Seas, (In Russian),
W77-02249 5C

Soybean Yield Responses and Assimilation of ZN and CD from Sewage Sludge-Amended Soil,
W77-02377 5C

CALCITE
Calcium Equilibrium in Mixed Ion Aqueous Systems Open to the Atmosphere,
W77-02538 2K

CALCIUM
Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

Potassium-Calcium Exchange Equilibria in Volcanic-Ash Soils,
W77-02277 2G

CALCIUM CARBONATE
Distribution of Calcium Carbonate in Surface Sediments of the Atlantic Ocean,
W77-02133 2L

Distribution of Carbonate in Surface Sediments of the Pacific Ocean,
W77-02134 2L

Calcium Equilibrium in Mixed Ion Aqueous Systems Open to the Atmosphere,
W77-02538 2K

CALCIUM CARBONATE DISTRIBUTION
Distribution of Calcium Carbonate in Surface Sediments of the Atlantic Ocean,
W77-02133 2L

Distribution of Carbonate in Surface Sediments of the Pacific Ocean,
W77-02134 2L

CALCIUM ION BINDING
Biology of Blue-Green Algae of Tide Marshes,
W77-02446 5C

CALIBRATIONS
The Hailpad Calibration for Italian Hail Damage Documentation,
W77-02486 2B

CALIFORNIA
Flow Control and Transients in the California Aqueduct,
W77-02136 8B

Descriptions and Chemical Analyses for Selected Wells in the Central Sacramento Valley, California,
W77-02299 2K

Water-Quality Study of a Reach of the Merced River in Yosemite National Park and Vicinity, California--April 1973 Through September 1974,
W77-02309 5A

CALIFORNIA STATE WATER PROJECT
Flow Control and Transients in the California Aqueduct,
W77-02136 8B

CALORIC CONTENT
Caloric Investigations on the Shore Community of a Fish Pond, (In German),
W77-02336 2H

CALVERT CLIFFS NUCLEAR POWERPLANT
Are the Chesapeake Bay Waters Warming Up.
W77-02472 2L

CANADA
Economic and Environmental Impacts of Agricultural Land Drainage in Ontario,
W77-02425 4A

Phosphate Reduction and Response of Plankton Populations in Kootenay Lake,
W77-02440 5C

Retransmission of Hydrometric Data in Canada,
W77-02506 7C

CANAL LININGS
Sanitary-Hygienic Aspects of the Use of New Preparations for Controlling Seepage in Water Bodies, (In Russian),
W77-02269 4A

CANALS
Seepage from Trapezoidal Canal in Anisotropic Soil,
W77-02137 2G

CANDIDA
Distribution of Aquatic Yeasts - Effect of Incubation Temperature and Chloramphenicol Concentration on Isolation,
W77-02525 5A

CANE SUGAR REFINING INDUSTRY
Economic Analysis of Effluent Guidelines: Cane Sugar Refining,
W77-02414 5D

CAPITELLA CAPITATA
Detrital Utilization by the Polychaete, Capitella Capitata,
W77-02435 5C

CARBON
Sulfur Fractions and Carbon-Nitrogen-Phosphorus-Sulfur Relationships in Some Brazilian and Iowa Soils,
W77-02102 2G

A Comparison of Nitrogen, Phosphorus, and Carbon in Sediments and Soils of Cultivated and Noncultivated Watersheds in the North Central States,
W77-02292 5G

Correlation of BOD, COD and Soluble Organic Carbon,
W77-02376 5A

CARBON-STEAM REACTION
Kinetics of the Activated Carbon-Steam Reaction,
W77-02519 5D

CARP
Development of the Chlorococcal Alga Coelastrum Microporum Naeg. in Fish-Breeding Ponds, (In Russian),
W77-02248 5C

CARRIZO-WILCOX AQUIFER (TEX)
Simulated Effects of the Proposed Tennessee Colony Reservoir on Ground-Water Conditions in the Carrizo-Wilcox Aquifer and Trinity River Alluvium, Texas,
W77-02305 4A

CARRYING CAPACITY
A Sensitive Algal Assay: An Improved Method for Analysis of Freshwaters,
W77-02524 5A

CASPIAN SEA
Hygienic Aspects of a Study of Bdellovibrio Bacteriovorus as a Natural Factor of Self-Purification of Water Bodies, (In Russian),
W77-02243 5C

CATALYTIC CONVERTERS
Ozone Removal from Arc Lamp Cooling Air,
W77-02511 7B

CATFISH
The Effect of Sub-Lethal Lead Concentrations on the Chemoreceptors of Two Fresh Water Fish Species, (In German),
W77-02383 5C

CATION EXCHANGE
Potassium-Calcium Exchange Equilibria in Volcanic-Ash Soils,
W77-02277 2G

CATIONS
Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

CELLULOSE
Study of Dewatering of Cellulosic Sludge from the Viscose Fiber Industry (Issledovanie po obezvozhivaniyu tsellyuloznogo shlama predpriyatii viskoznogo volokna),
W77-02575 5D

CENTER PIVOT IRRIGATION
Herbicides and Surface Irrigation-Do They Make A Team,
W77-02200 3F

CENTRAL SACRAMENTO VALLEY (CALIF)
Descriptions and Chemical Analyses for Selected Wells in the Central Sacramento Valley, California,
W77-02299 2K

CENTRIFUGATION
Water-Borne Viruses: Their Characterization by Raman Spectroscopy,
W77-02183 5A

CERCOSPORA RODMANII
Evaluation of Cercospora Rodmanii as a Biological Control of Waterhyacinths,
W77-02528 5G

Cercospora Rodmanii, A New Pathogen of Water Hyacinth with Biological Control Potential,
W77-02540 5G

CHANNEL FLOW
A Model for Predicting Flood Hazards Due to Specific Land-Use Practices,
W77-02078 2A

CHAPARRAL
Chaparral Management: Its Potential--Its Problems--Its Future,
W77-02111 3B

CHAPARRAL MANAGEMENT
Chaparral Management: Its Potential--Its Problems--Its Future,
W77-02111 3B

CHARA
Effect of Salinization on Hydromacrophytes of the Kuban Estuaries, (In Russian),
W77-02255 2L

CHEM CONTROL
State Consideration of the Rivers Zeta and Moraca Based on the Chemical Control, (In Serbo-Croatiau),
W77-02266 5G

CHEMICAL ANALYSIS
Water-Quality Study of a Reach of the Merced River in Yosemite National Park and Vicinity, California--April 1973 Through September 1974,
W77-02309 5A

Analytical Methodologies for Leachate and Gas Analysis,
W77-02402 5A

Gas and Leachate Generation in Various Solid Waste Environments,
W77-02405 5E

Leachate Migration Through Selected Clays,
W77-02406 5B

CHEMICAL DEGRADATION
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

CHEMICAL INDUSTRY
Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Phosphorus Derived Chemicals Segment of the Phosphate Manufacturing Point Source Category,
W77-02431 5G

CHEMICAL OXYGEN DEMAND
Correlation of BOD, COD and Soluble Organic Carbon,
W77-02376 5A

Determination of Chemical Oxygen Demand (Die Bestimmung Der Chemischen Oxidierbarkeit),
W77-02380 5A

CHEMICAL PRECIPITATION
Interactions of Ferric and Ferrous Irons and Organic Matter in Water Environment,
W77-02389 5B

CHEMICAL PROPERTIES
The Effect of Ammonia and Ammonia-Sulfur Solutions on Nitrification Rates and Chemical Properties of a Calcareous Soil,
W77-02276 2G

Phosphorus Removal with Alum from Secondary Effluent,
W77-02346 5D

CHEMICAL WASTES
Dynamics of the Content of Some Organic Toxic Substances in Plants Irrigated with Effluents of the Coal-Tar Chemical Industry, (In Russian),
W77-02263 5C

Phosphorus Removal with Alum from Secondary Effluent,
W77-02346 5D

Environmental Aspects of Chemical Use in Printing Operations, (September 22-24, 1975, King of Prussia, PA.), Conference Proceedings.
W77-02553 5C

CHEMICALS
Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

CHEMORECEPTORS (FISH)
The Effect of Sub-Lethal Lead Concentrations on the Chemoreceptors of Two Fresh Water Fish Species, (In German),
W77-02383 5C

CHESAPEAKE BAY
Are the Chesapeake Bay Waters Warming Up,
W77-02472 2L

CHILE (SOILS)
Potassium-Calcium Exchange Equilibria in Volcanic-Ash Soils,
W77-02277 2G

CHINA
The Role of Silt in Eradication of Oncomelaniid Snails in Grassy Beaches, (In Chinese).
W77-02245 5G

CHLORAMPHENICOL
Distribution of Aquatic Yeasts - Effect of Incubation Temperature and Chloramphenicol Concentration on Isolation,
W77-02525 5A

CHLORIDES
Hygienic Standardization of Octylic Stabilizers of Polyvinylchloride in Water Bodies, (In Russian),
W77-02264 5G

Chlorides in the Kraft Recovery System. II. Process and Equipment Aspects on a Closed Bleached Kraft Mill,
W77-02560 5D

CHLORINATION
Effectiveness of Continuous Chlorination of Well Water by Dosage Cartridges in Transcarpathia, (In Russian),
W77-02256 5F

CHLORINE
Aqueous Halogen Equilibria, Case I. Halogen in Pure Water,
W77-02150 5D

CHLORINE HYDROLYSIS
Aqueous Halogen Equilibria, Case I. Halogen in Pure Water,
W77-02150 5D

CHLOROCOCCAL ALGA
Development of the Chlorococcal Alga Coelastrum Microporum Naeg. in Fish-Breeding Ponds, (In Russian),
W77-02248 5C

CHLOROPHYLL
Some Aspects of Municipal Overflow Reservoir Monitoring, (In Swedish),
W77-02228 5A

Production of Phytoplankton of Lake Baikal in the Region of Listvennichnoye Village, (In Russian),
W77-02253 5C

CHLOROPHYTA
Interactions of Ferric and Ferrous Irons and Organic Matter in Water Environment,
W77-02389 5B

CHROMIUM
Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

Compilation of State Data for Eight Selected Toxic Substances, Vol. 1, Final Report,
W77-02204 5G

Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

CHUKCHI SEA
The Barrow Submarine Canyon: A Drain for the Chukchi Sea,
W77-02481 2L

CIRCULATION
The Circulation and Salinity Distribution of the Upper Potomac Estuary,
W77-02132 2L

CIRCULATION DISTRIBUTION
The Circulation and Salinity Distribution of the Upper Potomac Estuary,
W77-02132 2L

CIRRUS CLOUDS
The Survival of Ice Particles Falling From Cirrus Clouds in Subsaturated Air,
W77-02488 2B

CITIES
Inadvertent Weather Modification,
W77-02453 3B

CITRUS
Spray Irrigation of Waste Water on Citrus Groves,
W77-02544 5D

CITRUS FRUITS
The Economics of Pressurized Irrigation Systems for Mature Citrus Orchards in Southwestern Arizona,
W77-02165 3F

CLAY MINERALS
Leachate Migration Through Selected Clays,
W77-02406 5B

Attenuation Mechanisms of Pollutants Through Soils,
W77-02408 5B

CLAYS
Effects of Phosphorus on Some Physical and Chemical Properties of Clays,
W77-02101 2G

CLIMATOLOGY
Climatic Inferences from Former Glaciers in the South-East Grampian Highlands, Scotland,
W77-02467 2C

CLOUD PHYSICS
Molecular Studies of the Ice-Forming Capabilities of Different Surfaces,
W77-02487 3B

The Survival of Ice Particles Falling From Cirrus Clouds in Subsaturated Air,
W77-02488 2B

Evolution of Raindrop Spectra with Collision-Induced Breakup,
W77-02489 2B

CLOUD SEEDING
Molecular Studies of the Ice-Forming Capabilities of Different Surfaces,
W77-02487 3B

CLOUDS
Inadvertent Weather Modification,
W77-02453 3B

COAGULATION
Salt Water Domestic Waste Treatment,
W77-02353 5D

Aspects of Sludge Treatment,
W77-02372 5D

COAL-TAR CHEMICAL WASTES
Dynamics of the Content of Some Organic Toxic Substances in Plants Irrigated with Effluents of the Coal-Tar Chemical Industry, (In Russian),
W77-02263 5C

COALS
Energy from Coal,
W77-02430 6D

COASTAL ENGINEERING
Mathematical Models in Hydraulics and Coastal Engineering,
W77-02471 2A

COASTAL MARSHES
Fourth Semiannual Interagency Briefing, February 1975, Washington, D.C.,
W77-02158 8G

Salt Marsh Establishment and Development,
W77-02420 4D

COASTAL PLAINS
Nitrogen Losses from Soils of the North Carolina Coastal Plain,
W77-02294 5B

COASTS
Ocean Dumping Phase-Out in EPA Region II,
W77-02393 5E

COATINGS
Glass Coated Steel Tanks,
W77-02361 8G

COELASTRUM-MICROPORUM
Development of the Chlorococcal Alga Coelastrum Microporum Naeg. in Fish-Breeding Ponds, (In Russian),
W77-02248 5C

COHESIVE SOILS
Scouring of Cohesive Soils,
W77-02127 2J

COLD REGIONS
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

COLIFORMS
Fecal Coliform Analysis: Effects of Elevated Temperatures on Quantitative Recovery,
W77-02182 5A

Modeling Coliform-Bacteria Concentrations and pH in the Salt-Wedge Reach of the Duwamish River Estuary, King County, Washington,
W77-02324 5B

The Role of Solar Ultraviolet Radiation in 'Natural' Water Purification,
W77-02552 5D

COLLOID FILTRATION
A Study of the Physicochemical Parameters Affecting the Removal of Colloidal Particles from Water by Porous Media,
W77-02086 5D

COLLOIDS
A Study of the Physicochemical Parameters Affecting the Removal of Colloidal Particles from Water by Porous Media,
W77-02086 5D

COLORADO
Ecological Impacts of Snowpack Augmentation in the San Juan Mountains of Colorado,
W77-02160 3B

Physical and Economic Effects on the Local Agricultural Economy of Water Transfer to Cities,
W77-02190

Effects of Water-Management Practices on the Flow of the South Platte River, Colorado,
W77-02303 4B

COLORADO RIVER BASIN
Law, Hydrology, and Surface-Water Supply in the Upper Colorado River Basin,
W77-02119 6E

COLORADO RIVER COMPACT
Law, Hydrology, and Surface-Water Supply in the Upper Colorado River Basin,
W77-02119 6E

COLORIMETRY
Determination of Small Quantities of Vinyl Acetate in Air, Water, Alcoholic Solutions and Food Products, (In Russian),
W77-02117 5A

COMMERCIAL FISH
Occurrence of Kerosene-Like Hydrocarbons in the Bream, Mylio Australis Gunther,
W77-02212 5C

COMPETING USES
Rational Water Pricing in the Tucson Basin,
W77-02170 6D

Competition and Spacing in Plant Communities: The Northern Mohave Desert,
W77-02174 2I

COMPOSTING
C(rown) Z(ellerbach)'s Solids Waste Problems at Wauna are Reduced by Composting,
W77-02572 5E

COMPUTER MODELS
Utility of Urban Runoff Modeling, (Proceedings of a Special Session, Spring Annual Meeting, American Geophysical Union, Washington, D.C. 14 April 1976.
W77-02076 2A

A Model for Predicting Flood Hazards Due to Specific Land-Use Practices,
W77-02078 2A

Simulation of Root-Zone Water and Deep Seepage to a Water Table,
W77-02295 2G

Simulated Effects of the Proposed Tennessee Colony Reservoir on Ground-Water Conditions in the Carrizo-Wilcox Aquifer and Trinity River Alluvium, Texas,
W77-02305 4A

A Bivariate-Regression Model for Estimating Chemical Composition of Streamflow or Groundwater,
W77-02317 5B

COMPUTER PROGRAMS
Computer Irrigation,
W77-02098 3F

A Computerized Information System on the Impacts of Coal-Fired Energy Development in the Southwest,
W77-02163 6G

COMPUTERS
Alarm System Continually Monitors Plant Functions,
W77-02382 8C

CONCRETE PIPES
Precast Segments Speed Installation of Thunder Bay Sewer,
W77-02330 8F

CONCRETE STRUCTURES
Construction of Goscote Sewage Pumping Station,
W77-02326 8C

Emergency Repair of a Deep Storm Sewer Line,
W77-02350 8G

Digestion is a Good Egg in Los Angeles,
W77-02365 5D

CONDEMNATION
Physical and Economic Effects on the Local Agricultural Economy of Water Transfer to Cities,
W77-02190 6B

CONFERENCE
Proceedings: 8th Annual Water Resources Seminar Groundwater Resources and Development November 24 and 25, 1975.
W77-02223 4B

CONFIGURATION INTERACTIONS
Configuration Interaction Studies of the Excited States of Water,
W77-02153 1A

CONFORMAL MAPPING
Seepage from Trapezoidal Canal in Anisotropic Soil,
W77-02137 2G

CONGO RIVER
Rare Earth Element Supply to the Ocean,
W77-02478 2L

CONIFERS
Patterns of Leaf Resistance to Lodgepole Pine Transpiration in Wyoming,
W77-02531 2D

CONNECTICUT
Algal Metabolite Influence on Bloom Sequence in Eutrophied Freshwater Ponds,
W77-02438 5C

A Sensitive Algal Assay: An Improved Method for Analysis of Freshwaters,
W77-02524 5A

Distribution of Aquatic Yeasts - Effect of Incubation Temperature and Chloramphenicol Concentration on Isolation,
W77-02525 5A

CONSTRUCTION
Tanks of Panel Construction.
W77-02325 8A

Construction of Goscote Sewage Pumping Station,
W77-02326 8C

Austin's 11 Mile Sewer Tunnel Reflects Sound Economic, Environmental Alternatives,
W77-02327 5D

Thurrock Beats Peat with Piled Pipes,
W77-02328 8E

Test New Sewers with Low-Pressure Air,
W77-02329 8G

Precast Segments Speed Installation of Thunder Bay Sewer,
W77-02330 8F

Glass Coated Steel Tanks.
W77-02361 8G

Digestion is a Good Egg in Los Angeles,
W77-02365 5D

CONSTRUCTION COSTS
Environmental Trust Funds: An Evaluation,
W77-02432 5G

CONSTRUCTION GRANT PROGRAM
Environmental Trust Funds: An Evaluation,
W77-02432 5G

CONSTRUCTION PRACTICES
Controlling Erosion and Sedimentation at Construction Sites,
W77-02146 4D

CONSTRUCTION SITES
Controlling Erosion and Sedimentation at Construction Sites,
W77-02146 4D

CONTACT STABILIZATION
Nitrification in High-Sludge Age Contact Stabilization,
W77-02349 5D

CONTINENTAL SHELF
Atlantic Offshore Oil: The Need for Planning and Regulation,
W77-02426 6G

CONTINUITY EQUATION
On the Species Transport Equation for Flow in Porous Media,
W77-02452 2F

CONTINUOUS FUNCTION DESIGNS
Crop Production Function Determinations as Influenced by Irrigation and Nitrogen Fertilization Using a Continuous Variable Design,
W77-02281 3F

CONTROL
Controlling Erosion and Sedimentation at Construction Sites,
W77-02146 4D

CONTROL EQUIPMENT
Controlling Erosion and Sedimentation at Construction Sites,
W77-02146 4D

CONTROL SYSTEMS
Flow Control and Transients in the California Aqueduct,
W77-02136 8B

CONVECTIVE DIFFUSION EQUATION
On the Species Transport Equation for Flow in Porous Media,
W77-02452 2F

CONVEYANCE STRUCTURES
Dilution and Design,
W77-02332 5E

COOLING TOWERS
Ways of Preventing Thermal Pollution of Water Bodies by Wastewaters of Nuclear Power Plants, (In Russian),
W77-02271 5G

COOLING WATER
Use of Waste Heat for Soil Warming in North Carolina,
W77-02532 5D

COPPER
Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

The Copper Industry and Water in Arizona,
W77-02166 3E

COPPER

Influence of Mercury, Lead, Cadmium and Copper on Primary Production and Phytoplankton in Some Coastal Areas of the Mediterranean and Red Seas, (In Russian),
W77-02249 5C

Trace Elements in Soils of the Dnieper-Bug Liman, (In Ukranian),
W77-02258 2G

CORES

Monitoring Toxic Chemicals in Land Disposal Sites,
W77-02409 5A

CORN (FIELD)

Effect of Abscisic Acid at Different Levels of Soil Water Potential on the Transpiration of Zea Mays,
W77-02121 3B

Nutrient Dilution-Antagonism Effects in Corn and Snap Beans in Relation to Rate and Source of Applied Potassium,
W77-02288 3F

Nutrient Distributions in a Spodosol During Corn Growth,
W77-02516 5B

COST ANALYSIS

Minimizing Costs in Well Field Design in Relation to Aquifer Models,
W77-02161 8B

COST-BENEFIT ANALYSIS

Metarationality in Benefit-Cost Analyses,
W77-02123 6B

Flow Data Collection for Infiltration-Inflow Analysis,
W77-02334 5D

COST COMPARISONS

A Comprehensive Systems Engineering Study of the True Economic Value of Unpolluted Water Versus Varying Degrees of Polluted Water,
W77-02220 5G

COST MINIMIZATION

Operation of a Reservoir Collecting Water from a Small Watershed,
W77-02126 4A

COSTS

The Economics of Pressurized Irrigation Systems for Mature Citrus Orchards in Southwestern Arizona,
W77-02165 3F

COTTON

Water Management of Short-Season High-Density Cotton,
W77-02164 3F

Effect of Lime on Boron Transport to and Uptake by Cotton,
W77-02282 3F

CRACKS

The Application of Fracture Mechanics to the Problem of Crevasse Penetration,
W77-02461 2C

CREVASSES

The Application of Fracture Mechanics to the Problem of Crevasse Penetration,
W77-02461 2C

CROP PRODUCTION

Water Management of Short-Season High-Density Cotton,
W77-02164 3F

Desert Food Factories,
W77-02176 3C

Crop Production Function Determinations as Influenced by Irrigation and Nitrogen Fertilization Using a Continuous Variable Design,
W77-02281 3F

CROP RESPONSE

Optimization of Water Use Efficiency Under High Frequency Irrigation--I. Evapotranspiration and Yield Relationship,
W77-02103 3F

Effect of Lime on Boron Transport to and Uptake by Cotton,
W77-02282 3F

Nutrient Dilution-Antagonism Effects in Corn and Snap Beans in Relation to Rate and Source of Applied Potassium,
W77-02288 3F

Soybean Yield Responses and Assimilation of ZN and CD from Sewage Sludge-Amended Soil,
W77-02377 5C

Crop Response to Tank Truck Application of Liquid Sludge,
W77-02390 5C

CROPS

Soil Changes Resulting from Cropping,
W77-02284 2G

A Bioeconomic Simulation Analysis of Regulating Groundwater Irrigation,
W77-02549 3F

CRUSTACEAN

The Aquaculture of Fresh Water Prawns, Macrobrachium Species,
W77-02209 3E

CRYSTAL RIVER (FLA)

Sedimentology and Paleoecology of Middle and Upper Eocene Carbonate Shoreline Sequences, Crystal River, Florida, U.S.A.,
W77-02545 2F

CULTURES

Fecal Coliform Analysis: Effects of Elevated Temperatures on Quantitative Recovery,
W77-02182 5A

CURRENTS (WATER)

Theoretical Monochromatic-Wave-Induced Currents in Intermediate Water with Viscosity and Nonzero Mass Transport,
W77-02159 2L

Large-Scale Current Measurements in Lake Huron,
W77-02473 2H

Water Motion on a Beach in the Presence of a Breakwater: 2. Mean Currents,
W77-02475 8B

CYANIDE

Compilation of State Data for Eight Selected Toxic Substances, Vol. 1, Final Report,
W77-02204 5G

Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

CYANOPHYTA

Chemical Composition of Blue-Green Algae in the Kremenchug Reservoir, (In Russian),
W77-02254 5C

Effect of Polyvinyl Chloride on Water Microflora, (In Russian),
W77-02386 5C

Algal Metabolite Influence on Bloom Sequence in Eutrophied Freshwater Ponds,
W77-02438 5C

Biology of Blue-Green Algae of Tide Marshes,
W77-02446 5C

The Effect of Selenite on the Physiological and Morphological Properties of the Blue-Green Alga Phormidium Luridum Var. Olivacea,
W77-02546 5C

CYLINDROSPERMUM SP

Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

DAMS

Elastic-Plastic Stability Analysis of Mine-Waste Embankments,
W77-02502 8D

DANUBE RIVER

Use of LANDSAT Data for Natural Resources Investigation in the Lower Basin of Danube and Danube Delta,
W77-02503 2L

DANUBE RIVER (HUNGARY)

The Effect of Current Velocity and Changes in Water Level on the Composition of the Planktonic Ciliate Population of the Danube River, (In Hungarian),
W77-02236 5C

DATA COLLECTION PLATFORMS

Use of the LANDSAT-2 Data Collection System in the Colorado River Basin Weather Modification Program,
W77-02500 2B

Retransmission of Hydrometric Data in Canada,
W77-02506 7C

DATA COLLECTIONS

Compilation of State Data for Eight Selected Toxic Substances, Vol. 1, Final Report,
W77-02204 5G

Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

National Environmental Statistical Report,
W77-02447 7C

Evaluation of the Feasibility of Using the Data Collection System to Operate a Network of Hydrological and Climato-Logical Stations at Sites Remote from Normal Communication Links,
W77-02501 7B

DATA PROCESSING

A Computerized Information System on the Impacts of Coal-Fired Energy Development in the Southwest,
W77-02163 6G

Automated Seismic Monitoring System for Lake Michigan Ice Studies,
W77-02468 2C

DD
Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

DT
Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

ECISION MAKING
Economic Effects of Enforcement Variables on Commercial Oil Pollution Control Strategy,
W77-02418 5G

Energy Development: The Environmental Tradeoffs. Vol. 2: Relative Environmental Assessment of Methods to Increase Energy Production, Crude Oil, Pipeline Quality Gas, and Electricity from Western Coal,
W77-02423 6G

ECOMPOSING ORGANIC MATTER
Detrital Utilization by the Polychaete, Capitella Capitata,
W77-02435 5C

EFLOCCULATION
Heavy Metals-Induced Deflocculation of Activated Sludge,
W77-02352 5D

EGRADATION
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

EGRADATION (DECOMPOSITION)
Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

EGREE OF DEGRADATION
Bio-Refractory Index for Organics in Water,
W77-02520 5A

EICERS
Lock Wall Deicing with Water Jets: Field Tests at Ship Locks in Montreal, Canada and Sault Ste. Marie, Michigan,
W77-02156 8C

ELAWARE
Biology of Blue-Green Algae of Tide Marshes,
W77-02446 5C

EMONSTRATION WATERSHEDS
Woods Canyon--A Large Scale Watershed Management Experiment: An Explanation and Interim Report,
W77-02110 3B

ENITRIFICATION
Nitrogen Losses from Soils of the North Carolina Coastal Plain,
W77-02294 5B

Freeing Waste Water from Nitrogenous CPDS - Using Partially Oxidised Sludge as Source of Organic Carbon.
W77-02339 5D

Denitrification of Nitrified Septic Tank Effluent,
W77-02347 5D

Fluid-Bed Reactor May Cut Sewage Costs.
W77-02367 5D

Nitrate Removal from Water at the Water-Mud Interface in Wetlands,
W77-02441 5G

DENSITY
Evaluation of Circulation in Estuaries,
W77-02456 2L

DENSITY GRADIENT CENTRIFUGATION
Water-Borne Viruses: Their Characterization by Raman Spectroscopy,
W77-02183 5A

DESALINATION
Prospects for an Agro-Industrial Complex on the Gaza-Sinai Sea Coast,
W77-02115 3A

Desalination to Play a Major Part in Middle East Water Supply.
W77-02175 3A

Desert Food Factories,
W77-02176 3C

The Influence of the Raw Water Conditioning on the Working Data of a Reverse Osmosis Plant to Produce Ultra-Pure Water (Einfluss der Rohwasserkonditionierung auf Betriebsdaten einer Umkehrosmose-Anlage zu Reinstwassererzeugung),
W77-02355 5D

Turbulent Transport to a Rotation Cylinder for Large Prandtl or Schmidt Numbers,
W77-02534 3A

Determination of Surface Equilibria and Mass Transfer Rates in a Concurrent Flow Bubble Column,
W77-02535 3A

DESALINATION APPARATUS
Desalination to Play a Major Part in Middle East Water Supply.
W77-02175 3A

DESALINATION PLANTS
Desalination to Play a Major Part in Middle East Water Supply.
W77-02175 3A

DESALINATION PROCESSES
Desalination to Play a Major Part in Middle East Water Supply.
W77-02175 3A

Desert Food Factories,
W77-02176 3C

DESERT PLANTS
Competition and Spacing in Plant Communities: The Northern Mohave Desert,
W77-02174 2I

Sodium Relations in Desert Plants: 5. Cation Balance When Grown in Solution Culture and in the Field in Three Species of Lycium from the Northern Mojave Desert,
W77-02178 3C

DESIGN
Utility of Urban Runoff Modeling, (Proceedings of a Special Session, Spring Annual Meeting, American Geophysical Union, Washington, D.C. 14 April 1976.
W77-02076 2A

Effluent-Free Bleached Kraft Pulp Mill. VIII. Bleach Plant Renovation and Design,
W77-02562 5D

DESIGN CRITERIA
Development of Design and Operating Criteria for Handling Advanced Waste Treatment Plant Sludge,
W77-02188 5D

Thurrock Beats Peat with Piled Pipes,
W77-02328 8E

Dilution and Design,
W77-02332 5E

Digestion is a Good Egg in Los Angeles,
W77-02365 5D

Risk-Safety Factor Relation for Storm Sewer Design,
W77-02551 5D

DESIGN *TESTING
The Design and Test of a Safe and Effective Storm-Sewer Inlet,
W77-02186 8B

DETERGENTS
Degradation of NTA Acid During Anaerobic Digestion,
W77-02364 5D

DETERMINISTIC MODELS
An Analysis of the Effects of Parameter Uncertainty in Deterministic Hydrologic Models,
W77-02125 2A

DETRITUS
Detrital Utilization by the Polychaete, Capitella Capitata,
W77-02435 5C

DEUTERIUM
The Determination of Seasonal Variations in Groundwater Recharge by Deuterium and Oxygen-18 Analysis for the Tucson Basin, Arizona,
W77-02169 2F

DEWATERING
Pilot Plant Travels on Wheels.
W77-02366 5D

Aspects of Sludge Treatment,
W77-02372 5D

Study of Dewatering of Cellulosic Sludge from the Viscose Fiber Industry (Issledovanie po obezvozhivaniyu tsellyuloznogo shlama predpriyatii viskoznogo volokna),
W77-02575 5D

DIATOMS
Algal Metabolite Influence on Bloom Sequence in Eutrophied Freshwater Ponds,
W77-02438 5C

DICHLOROPHENOXYACETIC ACID
Ozone and Vascular Tissue Differentiation in Plants,
W77-02439 5C

DICHLOROPHENYLUREA
Experimental Study of Safe Levels of the Herbicides Linuron and Dichlorphenyloxyurea in Water Bodies, (In Russian),
W77-02265 5G

DIFFUSION
A Study of the Physicochemical Parameters Affecting the Removal of Colloidal Particles from Water by Porous Media,
W77-02086 5D

Transverse Mixing in Natural Channels,
W77-02313 2E

U. OF I. URBANA-LIBRARY

DIGESTION

DIGESTION
Wastewater Plant Does Nicely Without Natural Gas, Thank You,
W77-02363 5D

DIGESTION TANKS
Digestion is a Good Egg in Los Angeles,
W77-02365 5D

DISCHARGE (WATER)
Organic Compounds in Pulp Mill Lagoon Discharge,
W77-02558 5A

DISCOUNT RATE
Principles of Determining a Social Discount Rate,
W77-02518 6B

DISINFECTION
Aqueous Halogen Equilibria, Case I. Halogen in Pure Water,
W77-02150 5D

Effectiveness of Continuous Chlorination of Well Water by Dosage Cartridges in Transcarpathia, (In Russian),
W77-02256 5F

Feasibility of High-Energy Electron Treatment of Municipal Sludge,
W77-02357 5D

DISPERSION
A Comparison of Lumped-Parameter and Diffusional Models Describing the Effects of the Outlet Boundary Conditions on the Mixing in Flow Systems,
W77-02147 2L

DISPOSAL
Fourth Semiannual Interagency Briefing, February 1975, Washington, D.C.,
W77-02158 8G

DISSOLVED OXYGEN
Identification and Quantification of Water Quality Change Inducting Mechanisms in Stratified Reservoirs,
W77-02089 5C

Oxygen in a Tidal River: Low Tide Concentration Correlates Linearly with Location,
W77-02145 2L

Hydrochemical Characteristics of the Orel River, (In Russian),
W77-02234 5A

A Discourse on the Biochemical Oxidation of Sewage,
W77-02373 5D

Chemical Catalyst Interference in the Winkler Titration Determination of Dissolved Oxygen -- A Method for Correction,
W77-02564 5A

DISTRIBUTION
The Distribution of Two Mosquito-Larvivorous Fishes, Gambusia Affinis and Oryzias Latipes, in the Tokyo Metropolitan Area, (In Japanese),
W77-02297 5G

Ice Movement and Distribution in the Bering Sea from March to June 1974,
W77-02482 2C

Distributions of 2,4-D and Water in Soil During Infiltration and Redistribution,
W77-02542 5B

DISTRIBUTION PATTERNS
An Ecosystem Analysis of Environmental Contamination by Lead,
W77-02211 5A

DITCHES
The Distribution of Two Mosquito-Larvivorous Fishes, Gambusia Affinis and Oryzias Latipes, in the Tokyo Metropolitan Area, (In Japanese),
W77-02297 5G

DIVINYLBENZENE
Hygienic Standardization of Diethylbenzene in Water Bodies, (In Russian),
W77-02152 5G

DNIEPER RIVER (USSR)
Factors Determining Aspects of Fish Parasitofauna Formation in the Kakhovka Reservoir, (In Russian),
W77-02246 5C

DOMESTIC WASTES
Salt Water Domestic Waste Treatment,
W77-02353 5D

DRAINAGE
Maryland Highway Drainage Study: Volume I - Summary Report,
W77-02490 4C

Maryland Highway Drainage Study: Volume II - A Comparison of Maryland Highway Drainage Practices With Those of Other Agencies,
W77-02491 4C

Maryland Highway Drainage Study: Volume III - A Linked System Model for the Synthesis of Hydrographs in Urban Areas,
W77-02492 4C

Maryland Highway Drainage Study: Volume VI - An Experimental Examination of the Subsurface Drainage of Roadways,
W77-02493 4C

Drainage of Vertical Columns of Lakeland Sand,
W77-02510 2G

DRAINAGE PRACTICES
Maryland Highway Drainage Study: Volume II - A Comparison of Maryland Highway Drainage Practices With Those of Other Agencies,
W77-02491 4C

DRAINAGE SYSTEMS
Analysis of Storm Water Seepage Basins in Peninsular Florida,
W77-02083 5G

Plastic Lining Overcomes Rugged Terrain,
W77-02333 8G

Economic and Environmental Impacts of Agricultural Land Drainage in Ontario,
W77-02425 4A

DREDGED MATERIAL
Fourth Semiannual Interagency Briefing, February 1975, Washington, D.C.,
W77-02158 8G

DREDGING
Fourth Semiannual Interagency Briefing, February 1975, Washington, D.C.,
W77-02158 8G

DRIP IRRIGATION
Drip Irrigation Filtration Problems an Research,
W77-02090 3I

Drip Irrigation Progress and Problems,
W77-02091 3I

Optimization of Water Use Efficiency Unde High Frequency Irrigation--I. Evapotranspira tion and Yield Relationship,
W77-02103 3

DROUGHTS
Drought Hazard in the United States: Research Assessment,
W77-02113 3I

DRYING
Combined Filter and Dryer for Sewage Sludg Etc. - Uses Band of Vacuum Filter to Carr Cake Through Filter Press.
W77-02341 5I

Pressing Characteristics of Waterhyacinth,
W77-02527 3

DULUTH-SUPERIOR AREA (MINN-WISC)
Water Pollution Investigation: Duluth-Superi Area,
W77-02202 5

DUNES
Geometry of Ripples and Dunes in Alluvi Channels,
W77-02130 2

DUPLIN RIVER (GA)
Oxygen in a Tidal River: Low Tide Concentr tion Correlates Linearly with Location,
W77-02145 2

DUVAL COUNTY (FLA)
Depth to Water Table, Recharge Area Drainage Basins, and Relief of Duval Count Florida,
W77-02311 7

DUWAMISH RIVER ESTUARY (WASH)
Modeling Coliform-Bacteria Concentratio and pH in the Salt-Wedge Reach of the Du wamish River Estuary, King County, Washin ton,
W77-02324 5

E. COLI
Fecal Coliform Analysis: Effects of Elevate Temperatures on Quantitative Recovery,
W77-02182 5

EAGLE LAKE (MINN)
Eagle Lake Pollution Control Project, Eag Lake Kandiyohi County, Minnesota, Benc Mark Studies,
W77-02215 5

ECOLOGICAL DISTRIBUTION
The Distribution of Two Mosquito-Larvivorou Fishes, Gambusia Affinis and Oryzias Latipe in the Tokyo Metropolitan Area, (In Japanese)
W77-02297 5

ECOLOGY
Ecological Impacts of Snowpack Augmentatio in the San Juan Mountains of Colorado.
W77-02160 3

ECONOMIC EFFICIENCY
Operation of a Reservoir Collecting Water fro a Small Watershed,
W77-02126 4

ECONOMIC IMPACT
Methods for Determining Recreational, Environmental, and Economic Consequences of Alternative Development Programs for the Bear Lake Area,
W77-02082 6B

Physical and Economic Effects on the Local Agricultural Economy of Water Transfer to Cities,
W77-02190 6B

Economic Analysis of Effluent Guidelines: Cane Sugar Refining,
W77-02414 5D

Economic Analysis of Effluent Guidelines: The Textiles, Friction and Sealing Materials Segment of the Asbestos Manufacturing Industry,
W77-02422 5G

Economic and Environmental Impacts of Agricultural Land Drainage in Ontario,
W77-02425 4A

Economic Impacts of Weather Variability,
W77-02429 3B

Economic Analysis of Effluent Guidelines for Seafood Processing Industry: (Fish Meal, Salmon, Bottom Fish, Clams, Oysters, Sardines, Scallops, Herring, Abalone),
W77-02433 5D

Economic Analysis of Effluent Guidelines: Beet Sugar Industry,
W77-02434 5D

ECONOMIC JUSTIFICATION
Economic Effects of Enforcement Variables on Commercial Oil Pollution Control Strategy,
W77-02418 5G

ECONOMICS
Old Answers to 'New' Problems: Henry George, Property Rights and Environmental Quality,
W77-02539 6B

EDDIES
Tracking a Gulf Stream Ring With SOFAR Floats,
W77-02139 2L

EDUCATION
Water Resource Problems and Research Needs of North Carolina,
W77-02181 9D

EFFECTS
On the Income Distributional Effects of Environmental Management Policies,
W77-02124 5G

EFFLUENT GUIDELINES
Economic Analysis of Effluent Guidelines: Cane Sugar Refining,
W77-02414 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Fabricated and Reclaimed Rubber Segment of the Rubber Processing Point Source Category,
W77-02415 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Formulated Fertilizer Segment of the Fertilizer Manufacturing, Point Source Category,
W77-02419 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Primary Aluminum Smelting Subcategory of the Aluminum Segment of the Nonferrous Metals Manufacturing, Point Source Category,
W77-02421 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Phosphorus Derived Chemicals Segment of the Phosphate Manufacturing Point Source Category,
W77-02431 5G

Economic Analysis of Effluent Guidelines for Seafood Processing Industry: (Fish Meal, Salmon, Bottom Fish, Clams, Oysters, Sardines, Scallops, Herring, Abalone),
W77-02433 5D

Economic Analysis of Effluent Guidelines: Beet Sugar Industry,
W77-02434 5D

EFFLUENT STANDARDS
Economic Analysis of Effluent Guidelines: The Textiles, Friction and Sealing Materials Segment of the Asbestos Manufacturing Industry,
W77-02422 5G

EFFLUENTS
On the Income Distributional Effects of Environmental Management Policies,
W77-02124 5G

Economic Analysis of Effluent Guidelines: Cane Sugar Refining,
W77-02414 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Fabricated and Reclaimed Rubber Segment of the Rubber Processing Point Source Category,
W77-02415 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Formulated Fertilizer Segment of the Fertilizer Manufacturing, Point Source Category,
W77-02419 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Primary Aluminum Smelting Subcategory of the Aluminum Segment of the Nonferrous Metals Manufacturing, Point Source Category,
W77-02421 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Phosphorus Derived Chemicals Segment of the Phosphate Manufacturing Point Source Category,
W77-02431 5G

Economic Analysis of Effluent Guidelines for Seafood Processing Industry: (Fish Meal, Salmon, Bottom Fish, Clams, Oysters, Sardines, Scallops, Herring, Abalone),
W77-02433 5D

Economic Analysis of Effluent Guidelines: Beet Sugar Industry,
W77-02434 5D

ELECTRIC POWER PRODUCTION
A Computerized Information System on the Impacts of Coal-Fired Energy Development in the Southwest,
W77-02163 6G

ELECTRODES
The Use of A Specific Ion Electrode for Determination of Bromide in Soils,
W77-02100 2G

ELECTRON BEAM TREATMENT
Feasibility of High-Energy Electron Treatment of Municipal Sludge,
W77-02357 5D

ELECTRON IMPACT EXCITATION
Configuration Interaction Studies of the Excited States of Water,
W77-02153 1A

ENDEMIC GOITER
Trace Elements in the Environment of Some Goiter Regions of the Tashkent Oblast, (In Russian),
W77-02388 5G

ENERGY
Mathematical Models for Use in Planning Regional Water Resources and Energy Systems,
W77-02079 6A

Irrigation Scheduling for Energy and Water Conservation,
W77-02093 3F

Energy from Coal.
W77-02430 6D

ENERGY CONVERSION
Water Requirements for Solar Energy,
W77-02122 3E

Wastewater Plant Does Nicely Without Natural Gas, Thank You,
W77-02363 5D

Current Solid Waste Management Activities in Puerto Rico,
W77-02399 5E

Energy Development: The Environmental Tradeoffs. Vol. 2: Relative Environmental Assessment of Methods to Increase Energy Production, Crude Oil, Pipeline Quality Gas, and Electricity from Western Coal,
W77-02423 6G

ENERGY PRODUCTION
Energy Development: The Environmental Tradeoffs. Vol. 2: Relative Environmental Assessment of Methods to Increase Energy Production, Crude Oil, Pipeline Quality Gas, and Electricity from Western Coal,
W77-02423 6G

ENERGY TRANSFER
Transport of Mass and Energy in Porous Media Due to Natural Convection--The Geothermal Basin Problem,
W77-02507 4B

ENTERIC BACTERIA
Hygienic Aspects of a Study of Bdellovibrio Bacteriovorus as a Natural Factor of Self-Purification of Water Bodies, (In Russian),
W77-02243 5C

Evaluation of Methods of Recovering Pathogenic Intestinal Microorganisms from Water, (In Russian),
W77-02244 5F

U. OF I. URBANA-CHAMPAIGN

ENTERIC BACTERIA

Effect of Polyvinyl Chloride on Water Microflora, (In Russian),
W77-02386 5C

ENTERIC VIRUSES

Laser Methods of Rapid Detection, Identification and Quantitation of Human Enteric Viruses in Sewage and Rivers,
W77-02184 5A

ENVIRONMENTAL CONTROL

On the Income Distributional Effects of Environmental Management Policies,
W77-02124 5G

ENVIRONMENTAL EFFECTS

Methods for Determining Recreational, Environmental, and Economic Consequences of Alternative Development Programs for the Bear Lake Area,
W77-02082 6B

Evaluation of Estuarine Site Development Lagoons,
W77-02088 5G

Ecological Impacts of Snowpack Augmentation in the San Juan Mountains of Colorado.
W77-02160 3B

Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

Energy Development: The Environmental Tradeoffs. Vol. 2: Relative Environmental Assessment of Methods to Increase Energy Production, Crude Oil, Pipeline Quality Gas, and Electricity from Western Coal,
W77-02423 6G

Economic and Environmental Impacts of Agricultural Land Drainage in Ontario,
W77-02425 4A

ENVIRONMENTAL IMPACTS

Energy Development: The Environmental Tradeoffs. Vol. 2: Relative Environmental Assessment of Methods to Increase Energy Production, Crude Oil, Pipeline Quality Gas, and Electricity from Western Coal,
W77-02423 6G

ENVIRONMENTAL MANAGEMENT

On the Income Distributional Effects of Environmental Management Policies,
W77-02124 5G

ENVIRONMENTAL POLICY

On the Income Distributional Effects of Environmental Management Policies,
W77-02124 5G

ENVIRONMENTAL QUALITY

National Environmental Statistical Report,
W77-02447 7C

ENVIRONMENTAL TRADEOFFS

Energy Development: The Environmental Tradeoffs. Vol. 2: Relative Environmental Assessment of Methods to Increase Energy Production, Crude Oil, Pipeline Quality Gas, and Electricity from Western Coal,
W77-02423 6G

EPHEMERAL STREAMS

Flow Recession in the Ephemeral Stream,
W77-02162 2E

EQUILIBRIUM

Calcium Equilibrium in Mixed Ion Aqueous Systems Open to the Atmosphere,
W77-02538 2K

EQUIPMENT

Sandwich Construction G.R.P.
W77-02368 8G

The Hailpad Calibration for Italian Hail Damage Documentation,
W77-02486 2B

Use of the LANDSAT-2 Data Collection System in the Colorado River Basin Weather Modification Program,
W77-02500 2B

Evaluation of the Feasibility of Using the Data Collection System to Operate a Network of Hydrological and Climato-Logical Stations at Sites Remote from Normal Communication Links,
W77-02501 7B

EROSION

Controlling Erosion and Sedimentation at Construction Sites,
W77-02146 4D

EROSION CONTROL

Controlling Erosion and Sedimentation at Construction Sites,
W77-02146 4D

Salt Marsh Establishment and Development,
W77-02420 4D

ERROR VARIANCE ANALYSIS

Sensitivity and Model Variance Analysis Applied to Some Evaporation and Evaportranspiration Models,
W77-02298 2D

ERTS

Evaluation of the Feasibility of Using the Data Collection System to Operate a Network of Hydrological and Climato-Logical Stations at Sites Remote from Normal Communication Links,
W77-02501 7B

ERTS (LANDSAT)

Applications of ERTS Products in Range and Water Management Problems, Sahelian Zone: Mali, Upper Volta and Niger,
W77-02167 4A

ESTUARIES

A Mixed-Dimension Kinematic Estuarine Model,
W77-02131 2L

Distribution of Salinity and Temperature in the Hudson Estuary,
W77-02141 2L

Oxygen in a Tidal River: Low Tide Concentration Correlates Linearly with Location,
W77-02145 2L

A Comparison of Lumped-Parameter and Diffusional Models Describing the Effects of the Outlet Boundary Conditions on the Mixing in Flow Systems,
W77-02147 2L

Exchange of Nutrients and Trace Metals Between Marsh Sediments and Estuarine Waters - A Field Study,
W77-02217 5B

Maine Rivers Bibliography- A User's Manual,
W77-02224 10C

Effect of Salinization on Hydromacrophytes of the Kuban Estuaries, (In Russian),
W77-02255 2L

Modeling Coliform-Bacteria Concentrations and pH in the Salt-Wedge Reach of the Duwamish River Estuary, King County, Washington,
W77-02324 5B

Estuarine Pollution Control. Objectives and Priorities,
W77-02343 5G

Evaluation of Circulation in Estuaries,
W77-02456 2I

ESTUARINE ENVIRONMENT

Evaluation of Estuarine Site Development Lagoons
W77-02088 5G

ETHYLENE GLYCOL

Compilation of State Data for Eight Selected Toxic Substances, Vol. 1, Final Report,
W77-02204 5G

EUTROPHICATION

Identification and Quantification of Water Quality Change Inducting Mechanisms in Stratified Reservoirs,
W77-02089 5C

Changes in Benthos and Fishes of a Stream Accompanying a Substantial Reduction in Plant Nutrients,
W77-02191 5C

Eagle Lake Pollution Control Project, Eagle Lake Kandiyohi County, Minnesota, Bench Mark Studies,
W77-02215 5C

Surveying America's Lakes.
W77-02375 5C

Zooplankton of the Region of Nosy-Be. VI Pteropods, Heteropods I Holoneritic and Internal-Neritic Species. Contribution to the Study of a Tropical Eutrophic Bay, (In French),
W77-02416 5C

Algal Metabolite Influence on Bloom Sequence in Eutrophied Freshwater Ponds,
W77-02438 5C

The Eutrophication Implications of Interactions Between Naturally Occurring Particulates and Methane Oxidizing Bacteria,
W77-02536 5C

EVALUATION

Energy Development: The Environmental Tradeoffs. Vol. 2: Relative Environmental Assessment of Methods to Increase Energy Production, Crude Oil, Pipeline Quality Gas and Electricity from Western Coal,
W77-02423 6C

Environmental Trust Funds: An Evaluation,
W77-02432 5C

EVAPORATION

Sensitivity and Model Variance Analysis Applied to Some Evaporation and Evaportranspiration Models,
W77-02298 2I

EVAPOTRANSPIRATION
Optimization of Water Use Efficiency Under High Frequency Irrigation--I. Evapotranspiration and Yield Relationship,
W77-02103 3F

Sensitivity and Model Variance Analysis Applied to Some Evaporation and Evaportranspiration Models,
W77-02298 2D

Evapotranspiration Model Tested for Soybean and Sorghum,
W77-02550 2D

EVAPOTRANSPIRATION CONTROL
Effect of Abscisic Acid at Different Levels of Soil Water Potential on the Transpiration of Zea Mays,
W77-02121 3B

EXCESSIVE PRECIPITATION
Use of Radar Information in Determining Flash Flood Potential,
W77-02509 2B

EXCITED STATES
Configuration Interaction Studies of the Excited States of Water,
W77-02153 1A

FAILURES
Alarm System Continually Monitors Plant Functions,
W77-02382 8C

FARM WASTES
Nitrate-Nitrogen Removal from Soil Profiles by Alfalfa,
W77-02290 2G

The Influence of High Quantities of Manure on Soil Water, and Plants, (In German),
W77-02387 5G

FEASIBILITY STUDIES
Denitrification of Nitrified Septic Tank Effluent,
W77-02347 5D

Polymers Cut Cost of Phosphorus Removal,
W77-02374 5D

FEDERAL GOVERNMENT
Current EPA Research Activities in Solid Waste Management,
W77-02396 5E

FERTILIZERS
Crop Response to Tank Truck Application of Liquid Sludge,
W77-02390 5C

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Formulated Fertilizer Segment of the Fertilizer Manufacturing, Point Source Category,
W77-02419 5D

FILTERS
Combined Filter and Dryer for Sewage Sludge Etc. - Uses Band of Vacuum Filter to Carry Cake Through Filter Press.
W77-02341 5D

Theoretical Model for a Submerged Biological Filter,
W77-02385 5D

FILTRATION
A Study of the Physicochemical Parameters Affecting the Removal of Colloidal Particles from Water by Porous Media,
W77-02086 5D

Removal of Viruses from Water by Magnetic Filtration,
W77-02214 5D

Recovery and Reuse of Alum from water Filtration Plant Sludge by Ultrafiltration,
W77-02371 5D

Factors Affecting the Adsorption of Polio Virus to Magnetite in Water and Wastewater,
W77-02530 5D

Hyperfiltration for Renovation of Textile Finishing Plant Wastewater,
W77-02557 5D

FINANCING
Environmental Trust Funds: An Evaluation,
W77-02432 5G

FINITE DIFFERENCE ANALYSIS
Prediction of Mound Geometry Under Recharge Basins,
W77-02144 2F

FINITE DIFFERENCE METHOD
Comparison of Linear Systems and Finite Difference Flow-Routing Techniques,
W77-02319 2E

FINITE ELEMENT ANALYSIS
A Model for Predicting Flood Hazards Due to Specific Land-Use Practices,
W77-02078 2A

Comparison of Linear Systems and Finite Difference Flow-Routing Techniques,
W77-02319 2E

FISH
Swimming of Slender Fish in a Non-Uniform Velocity Field,
W77-02155 2L

Changes in Benthos and Fishes of a Stream Accompanying a Substantial Reduction in Plant Nutrients,
W77-02191 5C

Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

The Distribution of Two Mosquito-Larvivorous Fishes, Gambusia Affinis and Oryzias Latipes, in the Tokyo Metropolitan Area, (In Japanese),
W77-02297 5G

FISH DISEASES
Development of the Chlorococcal Alga Coelastrum Microporum Naeg. in Fish-Breeding Ponds, (In Russian),
W77-02248 5C

FISH HYDRODYNAMICS
Swimming of Slender Fish in a Non-Uniform Velocity Field,
W77-02155 2L

FISH PARASITES
Factors Determining Aspects of Fish Parasitofauna Formation in the Kakhovka Reservoir, (In Russian),
W77-02246 5C

FJORDS
Analgological Survey of the Sondeledfjord Near Risor, S. Norway: A 'Land-Locked' Fjord Exposed to Pollution, (In Norwegian),
W77-02252 5B

FLASH FLOODS
Use of Radar Information in Determining Flash Flood Potential,
W77-02509 2B

FLOCCULATION
Heavy Metals-Induced Deflocculation of Activated Sludge,
W77-02352 5D

FLOOD CONTROL
Analysis of Storm Water Seepage Basins in Peninsular Florida,
W77-02083 5G

Effects of Water Management on Fresh-Water Discharge to Biscayne Bay,
W77-02314 4A

FLOOD DISASTER PROTECTION ACT OF 1973
The Flood Disaster Protection Act of 1973,
W77-02427 6F

FLOOD FORECASTING
A Model for Predicting Flood Hazards Due to Specific Land-Use Practices,
W77-02078 2A

Use of Radar Information in Determining Flash Flood Potential,
W77-02509 2B

FLOOD FREQUENCY
An Analysis of the Effects of Parameter Uncertainty in Deterministic Hydrologic Models,
W77-02125 2A

FLOOD IRRIGATION
Experts Cling to Water Myths,
W77-02120 3F

FLOOD PLAIN INSURANCE
The Flood Disaster Protection Act of 1973,
W77-02427 6F

FLOOD PLAIN ZONING
The Flood Disaster Protection Act of 1973,
W77-02427 6F

FLOOD PLAINS
Hydrogeologic Characteristics of the Missouri River Valley Flood Plain,
W77-02194 2F

FLORIDA
Analysis of Storm Water Seepage Basins in Peninsular Florida,
W77-02083 5G

Movement of Fertilizer and Herbicide Through Irrigated Sands,
W77-02219 5B

Effects of Water Management on Fresh-Water Discharge to Biscayne Bay,
W77-02314 4A

Hydrology of Lake County, Florida,
W77-02316 4B

Water Resources Information Needs for the Suwannee River Water Management District,
W77-02318 4A

Silver Content of Precipitation from Seeded and Nonseeded Florida Cumuli,
W77-02485 2K

U. OF I. URBANA-CHAMPAIGN

FLORIDA

Drainage of Vertical Columns of Lakeland Sand,
W77-02510 2G

Detection of Subsurface Solution Cavities in Florida Using Electrical Resistivity Measurements,
W77-02517 2F

Removal of Algae from Florida Lakes by Magnetic Filtration,
W77-02522 5D

Evaluation of Cercospora Rodmanii as a Biological Control of Waterhyacinths,
W77-02528 5G

Cercospora Rodmanii, A New Pathogen of Water Hyacinth with Biological Control Potential,
W77-02540 5G

Sedimentology and Paleoecology of Middle and Upper Eocene Carbonate Shoreline Sequences, Crystal River, Florida, U.S.A.,
W77-02545 2F

FLOW
Evaluation of Circulation in Estuaries,
W77-02456 2L

FLOW CHARACTERISTICS
Comparison of Linear Systems and Finite Difference Flow-Routing Techniques,
W77-02319 2E

FLOW CONTROL
Flow Control and Transients in the California Aqueduct,
W77-02136 8B

Effects of Water Management on Fresh-Water Discharge to Biscayne Bay,
W77-02314 4A

FLOW RESISTANCE
Geometry of Ripples and Dunes in Alluvial Channels,
W77-02130 2J

FLUORESCENCE
Optical Remote Sensing of Water Pollutants,
W77-02192 5A

FLUORIDATION
Need for Fluoridation of Drinking Water in Krasnodon, (In Russian),
W77-02338 5F

FLUORIDES
Diffusion Cell for Isolation of Hydrogen Fluoride from the Analyzed Sample Determining Fluorine in Water, (In Russian),
W77-02105 5A

FLUORINE
Diffusion Cell for Isolation of Hydrogen Fluoride from the Analyzed Sample Determining Fluorine in Water, (In Russian),
W77-02105 5A

FLUOROMETRY
Modification of a Commercial Spectrofluorometer for Rapid Determination of Near Infrared Emission,
W77-02537 2K

FLUTE FORMATION
A Theoretical Analysis of the Formation of Glacial Flutes,
W77-02466 2C

FLUTES
The Origin of Glacially Fluted Surfaces - Observations and Theory,
W77-02465 2C

A Theoretical Analysis of the Formation of Glacial Flutes,
W77-02466 2C

FLUVIAL SEDIMENTS
Stratigraphy of the Paleocene and Lower Part of the Eocene in Western Tennessee,
W77-02315 2F

FOG
A Note on the Contribution of Rime and Surface Hoar to the Accumulation on the Ross Ice Shelf, Antarctica,
W77-02469 2C

FOOD CHAINS
An Ecosystem Analysis of Environmental Contamination by Lead,
W77-02211 5A

Detrital Utilization by the Polychaete, Capitella Capitata,
W77-02435 5C

FOOD PROCESSING INDUSTRY
Economic Analysis of Effluent Guidelines for Seafood Processing Industry: (Fish Meal, Salmon, Bottom Fish, Clams, Oysters, Sardines, Scallops, Herring, Abalone),
W77-02433 5D

FOREST MANAGEMENT
Arizona's Frozen Assets: Snowpack Management,
W77-02106 2C

Managing the Southwestern National Forests for Water and Related Resources,
W77-02107 4A

Woods Canyon--A Large Scale Watershed Management Experiment: An Explanation and Interim Report,
W77-02110 3B

FOREST PRODUCTS INDUSTRY
Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Plywood, Hardboard and Wood Preserving Segment of the Timber Products Processing Point Source Category,
W77-02554 5G

FORESTS
Remote Sensing of Effects of Land-Use Practices on Water Quality,
W77-02497 5A

FREE STREAM TURBULENCE
Grid Turbulence in Hydraulic Models,
W77-02128 8B

FRESHWATER FISH
The Aquaculture of Fresh Water Prawns, Macrobrachium Species,
W77-02209 3E

FROUDE NUMBER

HURRICANE CAMILLE
A Model for Predicting Flood Hazards Due to Specific Land-Use Practices,
W77-02078 2A

HYDRAULIC BREAKWATERS
Partial Wave Damping in Pneumatic Breakwaters,
W77-02455 8B

HYDRAULIC MODELS
Flow Recession in the Ephemeral Stream,
W77-02162 2E

HYDRAULIC SIMILITUDE
Grid Turbulence in Hydraulic Models,
W77-02128 8B

HYDRAULIC STRUCTURES
Test New Sewers with Low-Pressure Air,
W77-02329 8G

Precast Segments Speed Installation of Thunder Bay Sewer,
W77-02330 8F

Dilution and Design,
W77-02332 5E

Plastic Lining Overcomes Rugged Terrain,
W77-02333 8G

Emergency Repair of a Deep Storm Sewer Line,
W77-02350 8G

HYDRAULICS
Estuarine Pollution Control: Objectives and Priorities,
W77-02343 5G

Partial Wave Damping in Pneumatic Breakwaters,
W77-02455 8B

Mathematical Models in Hydraulics and Coastal Engineering,
W77-02471 2A

HYDROBIOLOGY
Bibliography of Soviet Literature on Freshwater Hydrobiology and Related Problems: 1974-1975 (Issue 19), (In Russian),
W77-02232 2I

HYDROCHEMICAL FEATURES
Hydrochemical Characteristics of the Orel River, (In Russian),
W77-02234 5A

HYDRODYNAMICS
Oblique Impingement of Plane Turbulent Jets,
W77-02464 8B

HYDROGEN FLUORIDE
Diffusion Cell for Isolation of Hydrogen Fluoride from the Analyzed Sample Determining Fluorine in Water, (In Russian),
W77-02105 5A

HYDROGEN ION CONCENTRATION
Modeling Coliform-Bacteria Concentrations and pH in the Salt-Wedge Reach of the Duwamish River Estuary, King County, Washington,
W77-02324 5B

HYDROGEN SULFIDE
Studies on the Tolerance of the Guppy, Poecilia Reticulata (Peters), a Natural Enemy of Mosquito Larvae, to the Septic Pollution of Water, (In Japanese),
W77-02238 5C

HYDROGEOLOGY
Geophysical Study of the Waterbearing Strata in Bitterroot Valley, Montana,
W77-02085 2F

Hydrogeologic Characteristics of the Missouri River Valley Flood Plain,
W77-02194 2F

Status of Ground-Water Modeling in the U.S. Geological Survey,
W77-02300 2F

Reconnaissance of Ground-Water Resources of the Squaxin Island Indian Reservation, Washington,
W77-02308 4B

Ground-Water Resources and Geology of St. Croix County, Wisconsin,
W77-02321 4B

Ground-Water Hydrology of the Cocoa Well-Field Area, Orange County, Florida,
W77-02323 4B

HYDROGRAPHS
Synthetic Design Hyetograph and Rational Runoff Coefficient,
W77-02135 2E

HYDROLOGIC BUDGET
Hydrology of Lake County, Florida,
W77-02316 4B

HYDROLOGIC DATA
Surface Water Supply of the United States, 1966-70: Part 1. North Atlantic Slope Basins--Volume 3. Basins from Maryland to York River.
W77-02307 7C

Depth to Water Table, Recharge Areas, Drainage Basins, and Relief of Duval County, Florida,
W77-02311 7C

Water Resources Information Needs for the Suwannee River Water Management District,
W77-02318 4A

HYDROLOGIC RESPONSE UNITS
A Model for Predicting Flood Hazards Due to Specific Land-Use Practices,
W77-02078 2A

HYDROLYSIS
Aqueous Halogen Equilibria, Case I. Halogen in Pure Water,
W77-02150 5D

HYETOGRAPHS
Synthetic Design Hyetograph and Rational Runoff Coefficient,
W77-02135 2E

HYPERFILTRATION
Hyperfiltration for Renovation of Textile Finishing Plant Wastewater,
W77-02557 5D

ICE
Lock Wall Deicing with Water Jets: Field Tests at Ship Locks in Montreal, Canada and Sault Ste. Marie, Michigan,
W77-02156 8C

The Effect of Subglacial Chemical Processes on Glacier Sliding.
W77-02459 2C

The Bearing Capacity of Floating Ice Plates Subjected to Static or Quasi-Static Loads,
W77-02460 2C

The Application of Fracture Mechanics to the Problem of Crevasse Penetration,
W77-02461 2C

A Theoretical Analysis of the Formation of Glacial Flutes,
W77-02466 2C

A Note on the Contribution of Rime and Surface Hoar to the Accumulation on the Ross Ice Shelf, Antarctica,
W77-02469 2C

A Concise Method for Analyzing the Ice-Melting Performance of a Heated Disc,
W77-02470 2C

Molecular Studies of the Ice-Forming Capabilities of Different Surfaces,
W77-02487 3B

The Survival of Ice Particles Falling From Cirrus Clouds in Subsaturated Air,
W77-02488 2B

ICE COVER
Measurements of the Turbulent Boundary Layer Under Pack Ice,
W77-02138 2C

Ice Movement and Distribution in the Bering Sea from March to June 1974,
W77-02482 2C

ICE MOVEMENT
Ice Movement and Distribution in the Bering Sea from March to June 1974,
W77-02482 2C

ICE REMOVAL
Lock Wall Deicing with Water Jets: Field Tests at Ship Locks in Montreal, Canada and Sault Ste. Marie, Michigan,
W77-02156 8C

ICE-WATER INTERFACES
The Effect of Subglacial Chemical Processes on Glacier Sliding,
W77-02459 2C

ICELAND
Water Flow in Glaciers: Jokulhlaups, Tunnels and Veins,
W77-02458 2C

The Origin of Glacially Fluted Surfaces - Observations and Theory,
W77-02465 2C

A Theoretical Analysis of the Formation of Glacial Flutes,
W77-02466 2C

ILLINOIS
An Ecosystem Analysis of Environmental Contamination by Lead,
W77-02211 5A

Environmental Impacts of Land Application of Sludge,
W77-02391 5D

ILLITE
Dissolution of Illite--A Possible Mechanism of Potassium Release,
W77-02283 2G

IMPAIRED WATER QUALITY
Evaluation of Estuarine Site Development Lagoons,
W77-02088 5G

IMPAIRED WATER USE
Utilization of Nutrients from Wastewater by Wheat,
W77-02112 5D

IMPOUNDED WATERS
SKYLAB Study of Water Quality,
W77-02505 5A

INADVERTENT WEATHER MODIFICATION
Inadvertent Weather Modification,
W77-02453 3B

INCIPIENT MOTION
Scouring of Cohesive Soils,
W77-02127 2J

INCOME DISTRIBUTION
On the Income Distributional Effects of Environmental Management Policies,
W77-02124 5G

INCUBATION
Distribution of Aquatic Yeasts - Effect of Incubation Temperature and Chloramphenicol Concentration on Isolation,
W77-02525 5A

INDIA
International Seabed Regime: India's Interests and Policy Options,
W77-02424 6E

INDIAN RESERVATIONS
Reconnaissance of Ground-Water Resources of the Squaxin Island Indian Reservation, Washington,
W77-02308 4B

INDOLEACETIC ACID
Ozone and Vascular Tissue Differentiation in Plants,
W77-02439 5C

INDUSTRIAL WASTES
Dynamics of the Content of Some Organic Toxic Substances in Plants Irrigated with Effluents of the Coal-Tar Chemical Industry, (In Russian),
W77-02263 5C

Sanitary-Hygienic Aspects of the Use of New Preparations for Controlling Seepage in Water Bodies, (In Russian),
W77-02269 4A

Estuarine Pollution Control: Objectives and Priorities,
W77-02343 5G

Wastewater Reuse-Industrial, Municipal, or Both,
W77-02358 5D

U. OF I. URBANA-LIBRARY

INDUSTRIAL WASTES

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Fabricated and Reclaimed Rubber Segment of the Rubber Processing Point Source Category,
W77-02415 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Formulated Fertilizer Segment of the Fertilizer Manufacturing, Point Source Category,
W77-02419 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Primary Aluminum Smelting Subcategory of the Aluminum Segment of the Nonferrous Metals Manufacturing, Point Source Category,
W77-02421 5D

INDUSTRIAL WATER

The Copper Industry and Water in Arizona,
W77-02166 3E

Wastewater Reuse-Industrial, Municipal, or Both,
W77-02358 5D

INDUSTRIES

Economic Effects of Enforcement Variables on Commercial Oil Pollution Control Strategy,
W77-02418 5G

INFILTRATION

Effect of Degree of Soil Profile Disruption on Plant Growth and Soil Water Extraction,
W77-02286 2G

Preliminary Selection of Storm-Water Basins Suitable for Infiltration of Reclaimed Water in Nassau County, Long Island, New York,
W77-02322 5G

Flow Data Collection for Infiltration-Inflow Analysis,
W77-02334 5D

Nutrient Distributions in a Spodosol During Corn Growth,
W77-02516 5B

Distributions of 2,4-D and Water in Soil During Infiltration and Redistribution,
W77-02542 5B

INFLOW

Flow Data Collection for Infiltration-Inflow Analysis,
W77-02334 5D

INHIBITION

Algal Metabolite Influence on Bloom Sequence in Eutrophied Freshwater Ponds,
W77-02438 5C

INLETS (WATERWAYS)

Notes on Tidal Inlets on Sandy Shores,
W77-02504 2L

INPUT-OUTPUT ANALYSIS

Methods for Determining Recreational, Environmental, and Economic Consequences of Alternative Development Programs for the Bear Lake Area,
W77-02082 6B

INSTITUTIONAL CONSTRAINRS

Experts Cling to Water Myths,
W77-02120 3F

INSTRUMENTATION

The Use of LANDSAT DCS and Imagery in Reservoir Management and Operation,
W77-02151 4A

Use of the LANDSAT 2 Data Collection System in the Colorado River Basin Weather Modification Program,
W77-02500 2B

Evaluation of the Feasibility of Using the Data Collection System to Operate a Network of Hydrological and Climato Logical Stations at Sites Remote from Normal Communication Links,
W77-02501 7B

INTAKES

The Design and Test of a Safe and Effective Storm-Sewer Inlet,
W77-02186 8B

INTERCEPTOR SEWERS

Austin's 11 Mile Sewer Tunnel Reflects Sound Economic, Environmental Alternatives,
W77-02327 5D

INTEREST

Principles of Determining a Social Discount Rate,
W77-02518 6B

INVERTEBRATES

A New Technique for Remote Monitoring of Activity of Freshwater Invertebrates with Special Reference Oxygen Consumption by Naids of Anax Sp. and Somatochlora Sp. (Odonata),
W77-02216 5C

Survey of Macroinvertebrate Communities in the Provo River and Diamond Fork Systems,
W77-02548 5C

IODINE

Aqueous Halogen Equilibria, Case I. Halogen in Pure Water,
W77-02150 5D

IODINE HYDROLYSIS

Aqueous Halogen Equilibria, Case I. Halogen in Pure Water,
W77-02150 5D

ION EXCHANGE

Hygienic Standardization of Diethylbenzene in Water Bodies, (In Russian),
W77-02152 5G

Studies of the Removal of Ammonia Nitrogen by Ion Exchange,
W77-02370 5D

ION EXCHANGE RESINS

Hygienic Standardization of Diethylbenzene in Water Bodies, (In Russian),
W77-02152 5G

IONIZATION

Feasibility of High-Energy Electron Treatment of Municipal Sludge,
W77-02357 5D

IOWA SOILS

Sulfur Fractions and Carbon-Nitrogen-Phosphorus-Sulfur Relationships in Some Brazilian and Iowa Soils,
W77-02102 2G

IRAQ

Vegetation and Soil of Saline Depressions Near Najaf, Central Iraq,
W77-02116 3C

IRON

Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

Some Aspects of the Chemical Composition of Trapa Natans L. in Lake Maggiore (Italy), Especially Manganese and Iron, (In French),
W77-02250 5C

A Model for the Simultaneous Production and Diffusion of Ferrous Iron in Submerged Soils,
W77-02278 2G

Fixation of Iron and Zinc Applied as Chelates into a Soil Column During Leaching,
W77-02280 2G

Dissolution of Illite--A Possible Mechanism of Potassium Release,
W77-02283 2G

Interactions of Ferric and Ferrous Irons and Organic Matter in Water Environment,
W77-02389 5B

IRON BACTERIA

Effect of Polyvinyl Chloride on Water Microflora, (In Russian),
W77-02386 5C

IRRIGATION

Optimization of Water Use Efficiency Under High Frequency Irrigation--I. Evapotranspiration and Yield Relationship,
W77-02103 3F

Seepage from Trapezoidal Canal in Anisotropic Soil,
W77-02137 2G

Physical and Economic Effects on the Local Agricultural Economy of Water Transfer to Cities,
W77-02190 6B

The Irrigator's Counselor,
W77-02197 3F

Crop Production Function Determinations as Influenced by Irrigation and Nitrogen Fertilization Using a Continuous Variable Design
W77-02281 3F

Effects of Water-Management Practices on the Flow of the South Platte River, Colorado,
W77-02303 4B

Spray Irrigation Solves Disposal Problem,
W77-02356 5D

A Study of Bacterial Aerosols at a Wastewater Irrigation Site,
W77-02392 5A

A Bioeconomic Simulation Analysis of Regulating Groundwater Irrigation,
W77-02549 3F

IRRIGATION EFFECTS

Crop Production Function Determinations as Influenced by Irrigation and Nitrogen Fertilization Using a Continuous Variable Design,
W77-02281 3F

IRRIGATION EFFICIENCY

Optimization of Water Use Efficiency Under High Frequency Irrigation--I. Evapotranspiration and Yield Relationship,
W77-02103 3F

Experts Cling to Water Myths,
W77-02120 3F

The Economics of Pressurized Irrigation Systems for Mature Citrus Orchards in Southwestern Arizona,
W77-02165 3F

He's Automating Dead Level Irrigation,
W77-02195 3F

The Irrigator's Counselor,
W77-02197 3F

IRRIGATION PRACTICES
Drip Irrigation Filtration Problems and Research,
W77-02090 3F

Drip Irrigation Progress and Problems,
W77-02091 3F

The Future of Automated Sprinkler Irrigation Systems,
W77-02092 3F

Sprinklers for Multiple Use,
W77-02095 3F

What's in the Future for Sprinkler Irrigation,
W77-02096 4A

A New Technique for Conserving Water,
W77-02097 3F

Optimization of Water Use Efficiency Under High Frequency Irrigation--I. Evapotranspiration and Yield Relationship,
W77-02103 3F

Utilization of Nutrients from Wastewater by Wheat,
W77-02112 5D

Experts Cling to Water Myths,
W77-02120 3F

The Economics of Pressurized Irrigation Systems for Mature Citrus Orchards in Southwestern Arizona,
W77-02165 3F

Desert Food Factories,
W77-02176 3C

Herbigation,
W77-02201 3F

Irrigating Soybeans with Limited Water,
W77-02523 3F

IRRIGATION SCHEDULING
Irrigation Scheduling for Energy and Water Conservation,
W77-02093 3F

Computer Irrigation,
W77-02098 3F

'Tuning In' Saves Water, Boosts Yields on Sandy Soils,
W77-02196 3F

IRRIGATION SYSTEMS
Experts Cling to Water Myths,
W77-02120 3F

The Economics of Pressurized Irrigation Systems for Mature Citrus Orchards in Southwestern Arizona,
W77-02165 3F

ISOLATION
Fecal Coliform Analysis: Effects of Elevated Temperatures on Quantitative Recovery,
W77-02182 5A

ISOTOPE STUDIES
The Determination of Seasonal Variations in Groundwater Recharge by Deuterium and Oxygen-18 Analysis for the Tucson Basin, Arizona,
W77-02169 2F

ITALY
Some Aspects of the Chemical Composition of Trapa Natans L. in Lake Maggiore (Italy), Especially Manganese and Iron, (In French),
W77-02250 5C

The Hailpad Calibration for Italian Hail Damage Documentation,
W77-02486 2B

JAPAN
Multidisciplinary Application of LANDSAT-2 Data to Marine Environment in Central Japan,
W77-02498 2L

JETS
Lock Wall Deicing with Water Jets: Field Tests at Ship Locks in Montreal, Canada and Sault Ste. Marie, Michigan,
W77-02156 8C

Oblique Impingement of Plane Turbulent Jets,
W77-02464 8B

JOKULHLAUPS
Water Flow in Glaciers: Jokulhlaups, Tunnels and Veins,
W77-02458 2C

KAISER EFFECT (SNOW)
Kaiser Effect in Snow,
W77-02154 2C

KAKHOVKA RESERVOIR (USSR)
Factors Determining Aspects of Fish Parasitofauna Formation in the Kakhovka Reservoir, (In Russian),
W77-02246 5C

KANSAS
Thermal Plumes in the Kansas River,
W77-02187 5B

SKYLAB Study of Water Quality,
W77-02505 5A

KANSAS RIVER (KAN)
Thermal Plumes in the Kansas River,
W77-02187 5B

KELP HABITAT IMPROVEMENT PROJECT
Kelp Habitat Improvement Project,
W77-02417 2L

KELPS
Kelp Habitat Improvement Project,
W77-02417 2L

KINETICS
Nitrification in High-Sludge Age Contact Stabilization,
W77-02349 5D

A Discourse on the Biochemical Oxidation of Sewage,
W77-02373 5D

Theoretical Model for a Submerged Biological Filter,
W77-02385 5D

Kinetics of the Activated Carbon-Steam Reaction,
W77-02519 5D

KRAFT MILLS
Chlorides in the Kraft Recovery System. I. Chlorides in the Recovery Boiler, and a Mechanism for Chloride Removal,
W77-02559 5D

Chlorides in the Kraft Recovery System. II. Process and Equipment Aspects on a Closed Bleached Kraft Mill,
W77-02560 5D

Effluent-Free Bleached Kraft Pulp Mill. VIII. Bleach Plant Renovation and Design,
W77-02562 5D

KRASNODON
Need for Fluoridation of Drinking Water in Krasnodon, (In Russian),
W77-02338 5F

KREMENCHUG RESERVOIR (USSR)
Chemical Composition of Blue-Green Algae in the Kremenchug Reservoir, (In Russian),
W77-02254 5C

KUBAN ESTUARIES (USSR)
Effect of Salinization on Hydromacrophytes of the Kuban Estuaries, (In Russian),
W77-02255 2L

LABORATORY TESTS
Scouring of Cohesive Soils,
W77-02127 2J

Grid Turbulence in Hydraulic Models,
W77-02128 8B

Evaluation of the Ring Oven Technique for Water Monitoring, Appendices,
W77-02149 5A

LAGOONS
Evaluation of Estuarine Site Development Lagoons,
W77-02088 5G

LAKE BORULLUS (EGYPT)
Some Effects of the Aswan High Dam on Water and Fishes of Lake Borullus, A. R. E.,
W77-02512 5C

LAKE CHAMPLAIN (VT)
Sedimentation Rates and Sediment Thicknesses in Lake Champlain: 1975-76,
W77-02193 2J

Geologic and Physical Factors Affecting Lake Champlain Shoreline Erosion,
W77-02222 2J

LAKE COUNTY (FLA)
Hydrology of Lake County, Florida,
W77-02316 4B

LAKE ERIE
Seasonal Variations of Temperature and Nutrients in the Surface Waters of Lakes Ontario and Erie,
W77-02515 5C

LAKE GRIMSVOTN
Water Flow in Glaciers: Jokulhlaups, Tunnels and Veins,
W77-02458 2C

LAKE HURON
Large-Scale Current Measurements in Lake Huron,
W77-02473 2H

LAKE ICE
Automated Seismic Monitoring System for Lake Michigan Ice Studies,
W77-02468 2C

U. OF I. URBANA-CHAMPAIGN

LAKE KOOTENAY (BRITISH COLUMBIA)
Phosphate Reduction and Response of Plankton Populations in Kootenay Lake,
W77-02440 5C

LAKE MAGGIORE (ITALY)
Some Aspects of the Chemical Composition of Trapa Natans L. in Lake Maggiore (Italy), Especially Manganese and Iron, (In French),
W77-02250 5C

LAKE MICHIGAN
Automated Seismic Monitoring System for Lake Michigan Ice Studies,
W77-02468 2C

LAKE ONTARIO
Mathematical Modeling of Phytoplankton in Lake Ontario. Part 2. Simulations Using Lake 1 Model,
W77-02443 5C

Seasonal Variations of Temperature and Nutrients in the Surface Waters of Lakes Ontario and Erie,
W77-02515 5C

LAKE RADASJON (SWEDEN)
Effects on the Phosphorous Situation in Lake Radasjon on Changes in the Pollution Situation, (In Swedish),
W77-02227 5C

LAKE RESTORATION
Studies on Lake Restoration by Phosphorus Inactivation,
W77-02442 5G

LAKE SEDIMENTS
Sedimentation Rates and Sediment Thicknesses in Lake Champlain: 1975-76,
W77-02193 2J

LAKE SHORES
Geologic and Physical Factors Affecting Lake Champlain Shoreline Erosion,
W77-02222 2J

LAKELAND SAND
Drainage of Vertical Columns of Lakeland Sand,
W77-02510 2G

LAKES
Elements of Limnological Specificity of Large Lakes in the Temperate Zone, (In Russian),
W77-02260 2H

Surface Water Supply of the United States, 1966-70: Part 1. North Atlantic Slope Basins--Volume 3. Basins from Maryland to York River.
W77-02307 7C

Surveying America's Lakes.
W77-02375 5C

Phosphate Reduction and Response of Plankton Populations in Kootenay Lake,
W77-02440 5C

Water Flow in Glaciers: Jokulhlaups, Tunnels and Veins,
W77-02458 2C

Some Effects of the Aswan High Dam on Water and Fishes of Lake Borullus, A. R. E.,
W77-02512 5C

LAND RECLAMATION
Strip-Mining Techniques to Minimize Environmental Damage in the Upper Missouri River Basin States,
W77-02445 5G

LAND USE
Remote Sensing of Effects of Land-Use Practices on Water Quality,
W77-02497 5A

Skylab Imagery: Application to Reservoir Management in New England,
W77-02499 4A

LANDFILLS
Gas and Leachate from Landfills: Formation, Collection, and Treatment. Proceedings of a Research Symposium.
W77-02394 5E

Introduction to Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment,
W77-02395 5E

Current Office of Solid Waste Management Programs - Landfill Activities,
W77-02397 5E

Current Solid Waste Research Activities in New York State,
W77-02398 5E

Current Solid Waste Management Activities in Puerto Rico,
W77-02399 5E

Landfill Research Work in Progress at Harwells Hazardous Materials Service,
W77-02400 5E

Theoretical Approach to Gas Movement Through Soils,
W77-02401 5B

Analytical Methodologies for Leachate and Gas Analysis,
W77-02402 5A

Leachate Attenuation in Undisturbed and Remoulded Soils,
W77-02403 5B

Variations in Gas and Leachate Production from Baled and Non-Baled Municipal Refuse,
W77-02404 5E

Gas and Leachate Generation in Various Solid Waste Environments,
W77-02405 5E

Leachate Migration Through Selected Clays,
W77-02406 5B

Organic Pollutants Contributed to Groundwater by a Landfill,
W77-02407 5B

Attenuation Mechanisms of Pollutants Through Soils,
W77-02408 5B

Monitoring Toxic Chemicals in Land Disposal Sites,
W77-02409 5A

Assessing Synthetic and Admixed Materials for Lining Landfills,
W77-02410 5E

Landfill Management with Leachate Recycle and Treatment: An Overview,
W77-02411 5D

Solid Waste Degradation Due to Shredding and Sludge Addition,
W77-02412 5E

Case History of Landfill Gas Movement Through Soils,
W77-02413 5E

An Experimental High-Ash Paper Mill Sludge Landfill: Second Annual Report,
W77-02555 5E

An Experimental High-Ash Paper Mill Sludge Landfill: First Annual Report,
W77-02556 5E

LANDSAT
The Use of LANDSAT DCS and Imagery in Reservoir Management and Operation,
W77-02151 4A

Monitoring Water Quality From LANDSAT.
W77-02494 5A

An Operational Application of Satellite Snow Cover Observations - Northwest United States,
W77-02496 2C

Remote Sensing of Effects of Land-Use Practices on Water Quality,
W77-02497 5A

Multidisciplinary Application of LANDSAT-2 Data to Marine Environment in Central Japan,
W77-02498 2L

Skylab Imagery Application to Reservoir Management in New England,
W77-02499 4A

Use of the LANDSAT-2 Data Collection System in the Colorado River Basin Weather Modification Program,
W77-02500 2B

Evaluation of the Feasibility of Using the Data Collection System to Operate a Network of Hydrological and Climato-Logical Stations at Sites Remote from Normal Communication Links,
W77-02501 7B

Use of LANDSAT Data for Natural Resources Investigation in the Lower Basin of Danube and Danube Delta,
W77-02503 2L

Retransmission of Hydrometric Data in Canada,
W77-02506 7C

LAPLACES EQUATION
Prediction of Mound Geometry Under Recharge Basins,
W77-02144 2F

LASER METHODS
Laser Methods of Rapid Detection, Identification and Quantitation of Human Enteric Viruses in Sewage and Rivers,
W77-02184 5A

LASER TECHNIQUES
Water-Borne Viruses: Their Characterization by Raman Spectroscopy,
W77-02183 5A

LAW OF THE SEA
International Seabed Regime: India's Interests and Policy Options,
W77-02424 6E

EACHATE
Gas and Leachate from Landfills: Formation, Collection, and Treatment. Proceedings of a Research Symposium.
W77-02394 5E

Introduction to Symposium on Gas and Leachate from Landfills: Formation, Collection, and Treatment,
W77-02395 5E

Landfill Management with Leachate Recycle nd Treatment: An Overview,
W77-02411 5D

ACHING
Fixation of Iron and Zinc Applied as Chelates nto a Soil Column During Leaching,
W77-02280 2G

AD
ffects of Selected Chemicals on Movement, rowth and Survival of Certain Aquatic nimal Life,
77-02084 5C

ompilation of State Data for Eight Selected oxic Substances, Vol. 1, Final Report,
77-02204 5G

ompilation of State Data for Eight Selected oxic Substances, Vol. IV, Compilations of ummaries and Analyses of State Data,
77-02205 5G

An Ecosystem Analysis of Environmental Contamination by Lead,
W77-02211 5A

Influence of Mercury, Lead, Cadmium and Copper on Primary Production and Phytoplankton in Some Coastal Areas of the Mediterranean and Red Seas, (In Russian),
W77-02249 5C

Maximum Allowable Concentration of Lead in Surface Waters, (In Russian),
W77-02262 5C

The Effect of Sub-Lethal Lead Concentrations on the Chemoreceptors of Two Fresh Water Fish Species, (In German),
W77-02383 5C

LEAD ACETATE
The Effect of Sub-Lethal Lead Concentrations on the Chemoreceptors of Two Fresh Water Fish Species, (In German),
W77-02383 5C

LEAF RESISTANCE
Patterns of Leaf Resistance to Lodgepole Pine Transpiration in Wyoming,
W77-02531 2D

LEAF SPOTS
Mycoleptodiscus Terrestris Leaf Spot on Waterhyacinth,
W77-02543 5G

LEAKAGE
Flow Data Collection for Infiltration-Inflow Analysis,
W77-02334 5D

LEGISLATION
Experimental Study of Safe Levels of the Herbicides Linuron and Dichlorphenyloxyurea in Water Bodies, (In Russian),
W77-02265 5G

Ocean Dumping Phase-Out in EPA Region II,
W77-02393 5E

Minnesota Water Resources Board and Watershed Districts.
W77-02428 6E

LETHAL LIMIT
Hygienic Standardization of Octylic Stabilizers of Polyvinylchloride in Water Bodies, (In Russian),
W77-02264 5G

Experimental Study of Safe Levels of the Herbicides Linuron and Dichlorphenyloxyurea in Water Bodies, (In Russian),
W77-02265 5G

Progress in Sublethal Effect Studies with Kraft Pulp Mill Effluent and Salmonids,
W77-02573 5C

LIMAN SOILS
Trace Elements in Soils of the Dnieper-Bug Liman, (In Ukranian),
W77-02258 2G

LIME
Effect of Lime on Boron Transport to and Uptake by Cotton,
W77-02282 3F

LIMITED IRRIGATION
Irrigating Soybeans with Limited Water,
W77-02523 3F

LIMNOLOGY
Elements of Limnological Specificity of Large Lakes in the Temperate Zone, (In Russian),
W77-02260 2H

LINEAR ALKYL BENZENESULFONATES
Thermal Effects on Biodegradation of Pollutants in Water,
W77-02218 5B

LINEAR ALKYL SULFONATES
Thermal Effects on Biodegradation of Pollutants in Water,
W77-02218 5B

LINEAR CONTROL CURVES
Operation of a Reservoir Collecting Water from a Small Watershed,
W77-02126 4A

LINEAR PROGRAMMING
Comparison of Linear Systems and Finite Difference Flow-Routing Techniques,
W77-02319 2E

LININGS
Sanitary-Hygienic Aspects of the Use of New Preparations for Controlling Seepage in Water Bodies, (In Russian),
W77-02269 4A

Assessing Synthetic and Admixed Materials for Lining Landfills,
W77-02410 5E

LINURON
Experimental Study of Safe Levels of the Herbicides Linuron and Dichlorphenyloxyurea in Water Bodies, (In Russian),
W77-02265 5G

LIPIDS
Lipids of Smittium Culisetae,
W77-02547 5A

LIQUID WASTES
Theoretical Model for a Submerged Biological Filter,
W77-02385 5D

LITHOFACIES
Sedimentology and Paleoecology of Middle and Upper Eocene Carbonate Shoreline Sequences, Crystal River, Florida, U.S.A.,
W77-02545 2F

LITTORAL
Analgological Survey of the Sondeledfjord Near Risor, S. Norway: A 'Land-Locked' Fjord Exposed to Pollution, (In Norwegian),
W77-02252 5B

LOAD DISTRIBUTION
Snow Pressure on Rigid Obstacles,
W77-02463 2C

LOCAL GOVERNMENTS
Utility of Urban Runoff Modeling, (Proceedings of a Special Session, Spring Annual Meeting, American Geophysical Union, Washington, D.C. 14 April 1976.
W77-02076 2A

LOCKS
Lock Wall Deicing with Water Jets: Field Tests at Ship Locks in Montreal, Canada and Sault Ste. Marie, Michigan,
W77-02156 8C

LODGEPOLE PINE TREES
Patterns of Leaf Resistance to Lodgepole Pine Transpiration in Wyoming,
W77-02531 2D

U. OF I. URBANA-CHAMPAIGN

LOUISIANA
Nitrate Removal from Water at the Water-Mud Interface in Wetlands,
W77-02441 5G

LOWER ST. LOUIS RIVER BASIN (MINN-WISC)
Water Pollution Investigation: Duluth-Superior Area,
W77-02202 5B

MACROCYSTIS
Kelp Habitat Improvement Project,
W77-02417 2L

MACROPHYTES
Caloric Investigations on the Shore Community of a Fish Pond, (In German),
W77-02336 2H

Use of Plant Pathogens for Bioregulation of Aquatic Macrophytes,
W77-02514 5G

MAGNESIUM
Dissolution of Illite--A Possible Mechanism of Potassium Release,
W77-02283 2G

MAGNETIC FILTRATION
Removal of Viruses from Water by Magnetic Filtration,
W77-02214 5D

Removal of Algae from Florida Lakes by Magnetic Filtration,
W77-02522 5D

Factors Affecting the Adsorption of Polio Virus to Magnetite in Water and Wastewater,
W77-02530 5D

MAGNETIC STUDIES
Waste Water Processing with HGMS (High Gradient Magnetic Separators),
W77-02348 5D

MAGNETITE
Factors Affecting the Adsorption of Polio Virus to Magnetite in Water and Wastewater,
W77-02530 5D

MAINE
The Use of LANDSAT DCS and Imagery in Reservoir Management and Operation,
W77-02151 4A

Maine Rivers Bibliography- A User's Manual,
W77-02224 10C

MALAYSIAN PRAWNS
The Aquaculture of Fresh Water Prawns, Macrobrachium Species,
W77-02209 3E

MALI
Applications of ERTS Products in Range and Water Management Problems, Sahelian Zone: Mali, Upper Volta and Niger,
W77-02167 4A

MANAGEMENT
Metarationality in Benefit-Cost Analyses,
W77-02123 6B

Old Answers to 'New' Problems: Henry George, Property Rights and Environmental Quality,
W77-02539 6B

MANGANESE
Some Aspects of the Chemical Composition of Trapa Natans L. in Lake Maggiore (Italy), Especially Manganese and Iron, (In French),
W77-02250 5C

Trace Elements in Soils of the Dnieper-Bug Liman, (In Ukranian),
W77-02258 2G

MANGANESE NODULES
International Seabed Regime: India's Interests and Policy Options,
W77-02424 6E

MAPS
The Meridian-Upper Wilcox Aquifer in Mississippi,
W77-02310 7C

Depth to Water Table, Recharge Areas, Drainage Basins, and Relief of Duval County, Florida,
W77-02311 7C

Maps Showing Ground-Water Conditions in the Lower Big Chino Valley and Williamson Valley Areas, Yavapai and Coconino Counties, Arizona,
W77-02312 7C

MARINE ANIMALS
Toxicity, Uptake and Survey Studies of Boron in the Marine Environment,
W77-02565 5C

MARINE FUNGI
Distribution of Aquatic Yeasts - Effect of Incubation Temperature and Chloramphenicol Concentration on Isolation,
W77-02525 5A

MARSH SEDIMENTS
Exchange of Nutrients and Trace Metals Between Marsh Sediments and Estuarine Waters - A Field Study,
W77-02217 5B

MARSHES
Exchange of Nutrients and Trace Metals Between Marsh Sediments and Estuarine Waters - A Field Study,
W77-02217 5B

MARYLAND
Maryland Highway Drainage Study: Volume I - Summary Report,
W77-02490 4C

Maryland Highway Drainage Study: Volume II - A Comparison of Maryland Highway Drainage Practices With Those of Other Agencies,
W77-02491 4C

MARYLAND POINT
The Circulation and Salinity Distribution of the Upper Potomac Estuary,
W77-02132 2L

MASS TRANSFER
Transport of Mass and Energy in Porous Media Due to Natural Convection--The Geothermal Basin Problem,
W77-02507 4B

Turbulent Transport to a Rotation Cylinder for Large Prandtl or Schmidt Numbers,
W77-02534 3A

Determination of Surface Equilibria and Ma Transfer Rates in a Concurrent Flow Bubb Column,
W77-02535 3

MASS TRANSPORT
On the Species Transport Equation for Flow Porous Media,
W77-02452 2

MASSACHUSETTS
Potential for Development of Ground Water a Test Site Near Truro, Massachusetts,
W77-02306 4

Groundwater and Groundwater Law in Ma sachusetts,
W77-02437 4

MATERIALS
Sandwich Construction G.R.P.
W77-02368 8

MATHEMATICAL MODELS
Mathematical Models for Use in Planning R gional Water Resources and Energy Systems,
W77-02079 6

Numerical Solution of Boussinesq Equation,
W77-02143

Swimming of Slender Fish in a Non-Unifor Velocity Field,
W77-02155

Sensitivity and Model Variance Analysis A plied to Some Evaporation and Evapotran piration Models,
W77-02298 2

Selection of Streamflow and Reservoir-Relea Models for River-Qualtiy Assessment,
W77-02302 2

Transverse Mixing in Natural Channels,
W77-02313

Theoretical Model for a Submerged Biologic Filter,
W77-02385 5

Theoretical Approach to Gas Moveme Through Soils,
W77-02401

Mathematical Models in Hydraulics a Coastal Engineering,
W77-02471 2

Modeling Reactions and Transport of Potas um in Soils,
W77-02529 2

MATHEMATICAL STUDIES
Configuration Interaction Studies of t Excited States of Water,
W77-02153 1

A Concise Method for Analyzing the Ice-Me ing Performance of a Heated Disc,
W77-02470

Mathematical Models in Hydraulics a Coastal Engineering,
W77-02471

MEASUREMENT
Toward a More Meaningful Index of Stud Quality,
W77-02378 5

A Simple Apparatus for Metering Volat Liquids into Water,
W77-02454

Measurements of Acoustic Properties of Hard-Pack Snow,
W77-02462 2C

The Hailpad Calibration for Italian Hail Damage Documentation,
W77-02486 2B

ECHANICAL PROPERTIES
The Bearing Capacity of Floating Ice Plates Subjected to Static or Quasi-Static Loads,
W77-02460 2C

EDAKA
The Distribution of Two Mosquito-Larvivorous Fishes, Gambusia Affinis and Oryzias Latipes, in the Tokyo Metropolitan Area, (In Japanese),
W77-02297 5G

EDITERRANEAN SEA
Influence of Mercury, Lead, Cadmium and Copper on Primary Production and Phytoplankton in Some Coastal Areas of the Mediterranean and Red Seas, (In Russian),
W77-02249 5C

EKONG RIVER
Rare Earth Element Supply to the Ocean,
W77-02478 2L

ELT WATER
Arizona's Frozen Assets: Snowpack Management,
W77-02106 2C

Water Flow in Glaciers: Jokulhlaups, Tunnels and Veins,
W77-02458 2C

ELTING
A Concise Method for Analyzing the Ice-Melting Performance of a Heated Disc,
W77-02470 2C

EMBRANE FILTER TECHNIQUES
Distribution of Aquatic Yeasts - Effect of Incubation Temperature and Chloramphenicol Concentration on Isolation,
W77-02525 5A

ERCURY
Compilation of State Data for Eight Selected Toxic Substances, Vol. 1, Final Report,
W77-02204 5G

ompilation of State Data for Eight Selected oxic Substances, Vol. IV, Compilations of ummaries and Analyses of State Data,
/77-02205 5G

he Mercury Content of Mollusks in the Ponvedra Estuary as a Measure of its Degree of ercury Contamination, (In Spanish),
'77-02226 5A

mission Spectrometic Element Determination the Nano- and Picogram Region After aporization of the Elements with Gas Plasmas duced with Microwaves: 1. Extremely Sensie Mercury Determination in Aqueous Solunns, Air Organic and Inorganic Materices, (In erman),
77-02229 5A

fluence of Mercury, Lead, Cadmium and pper on Primary Production and Phytoplankn in Some Coastal Areas of the Mediterrane- and Red Seas, (In Russian),
77-02249 5C

traction-Photometric Determination of Mercy in Soil and Water, (In Russian),
77-02272 5A

METABOLISM
Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

The Effect of Water with Different Mineralization Levels on the Animal Body, (In Russian),
W77-02270 5C

METAGAME ANALYSIS
Metarationality in Benefit-Cost Analyses,
W77-02123 6B

METALS
An Ecosystem Analysis of Environmental Contamination by Lead,
W77-02211 5A

METARATIONALITY
Metarationality in Benefit-Cost Analyses,
W77-02123 6B

METEOROLOGICAL DATA
Are the Chesapeake Bay Waters Warming Up,
W77-02472 2L

Retransmission of Hydrometric Data in Canada,
W77-02506 7C

METHANE
Wastewater Plant Does Nicely Without Natural Gas, Thank You,
W77-02363 5D

Theoretical Approach to Gas Movement Through Soils,
W77-02401 5B

METHANE BACTERIA
The Eutrophication Implications of Interactions Between Naturally Occurring Particulates and Methane Oxidizing Bacteria,
W77-02536 5C

METHANE FIXATION
The Eutrophication Implications of Interactions Between Naturally Occurring Particulates and Methane Oxidizing Bacteria,
W77-02536 5C

METHANE OXIDATION
The Eutrophication Implications of Interactions Between Naturally Occurring Particulates and Methane Oxidizing Bacteria,
W77-02536 5C

METHODOLOGY
Metarationality in Benefit-Cost Analyses,
W77-02123 6B

METHYLBENZENE
A Simple Apparatus for Metering Volatile Liquids into Water,
W77-02454 7B

MICROBIAL DEGRADATION
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

MICROBIOLOGY
Bibliography of Soviet Literature on Freshwater Hydrobiology and Related Problems: 1974-1975 (Issue 19), (In Russian),
W77-02232 2I

Gas and Leachate Generation in Various Solid Waste Environments,
W77-02405 5E

MICROCYSTIS-AERUGINOSA
Chemical Composition of Blue-Green Algae in the Kremenchug Reservoir, (In Russian),
W77-02254 5C

MICROCYSTIS-WESENBERGII
Chemical Composition of Blue-Green Algae in the Kremenchug Reservoir, (In Russian),
W77-02254 5C

MICROECONOMIC DECISION MODEL
Economic Effects of Enforcement Variables on Commercial Oil Pollution Control Strategy,
W77-02418 5G

MICRONUTRIENTS
Interactions of Micronutrients in Barley Grown on Zinc-Polluted Soils,
W77-02287 2G

MICROORGANISMS
Evaluation of Methods of Recovering Pathogenic Intestinal Microorganisms from Water, (In Russian),
W77-02244 5F

MICROWAVE BRIGHTNESS TEMPERATURE
Satellite Microwave Observations of Soil Moisture Variations,
W77-02495 2G

MICROWAVES
Spectral Characteristics of the Microwave Emission from a Wind-Driven Foam-Covered Sea,
W77-02476 2L

Remote Sensing of Soil Moisture by a 21-CM Passive Radiometer,
W77-02480 2G

Satellite Microwave Observations of Soil Moisture Variations,
W77-02495 2G

MIDDLE EAST
Desalination to Play a Major Part in Middle East Water Supply.
W77-02175 3A

MIGRATION
Leachate Migration Through Selected Clays,
W77-02406 5B

MINE ACIDS
Acid Mine Drainage (A Bibliography with Abstracts),
W77-02207 5G

MINE DRAINAGE
Acid Mine Drainage (A Bibliography with Abstracts),
W77-02207 5G

MINE WASTES
Acid Mine Drainage (A Bibliography with Abstracts),
W77-02207 5G

Elastic-Plastic Stability Analysis of Mine Waste Embankments,
W77-02502 8D

MINE WATER
The Copper Industry and Water in Arizona,
W77-02166 3E

Acid Mine Drainage (A Bibliography with Abstracts),
W77-02207 5G

U. OF I. URBANA-CHAMPAIGN

MINE WATER

Water Quality Impacts of Uranium Mining and Milling Activities in the Grants Mineral Belt, New Mexico,
W77-02208 5G

MINERAL CONSTITUENTS
SKYLAB Study of Water Quality,
W77-02505 5A

MINERAL TRANSFORMATIONS
A Thermodynamic Model for Predicting the Formation, Stability, and Weathering of Common Soil Minerals,
W77-02285 2G

MINERALOGY
The Effect of Water with Different Mineralization Levels on the Animal Body, (In Russian),
W77-02270 5C

MINING
Water Quality Impacts of Uranium Mining and Milling Activities in the Grants Mineral Belt, New Mexico,
W77-02208 5G

International Seabed Regime: India's Interests and Policy Options,
W77-02424 6E

MINNEAPOLIS-SAINT PAUL (MINN)
Minneapolis-St. Paul: Land of the 'Shining Big-Sea-Waters',
W77-02351 5D

MINNESOTA
Eagle Lake Pollution Control Project, Eagle Lake Kandiyohi County, Minnesota, Bench Mark Studies,
W77-02215 5G

Proceedings: 8th Annual Water Resources Seminar Groundwater Resources and Development November 24 and 25, 1975.
W77-02223 4B

Minneapolis-St. Paul: Land of the 'Shining Big-Sea-Waters',
W77-02351 5D

Minnesota Water Resources Board and Watershed Districts.
W77-02428 6E

MISSISSIPPI
The Meridian-Upper Wilcox Aquifer in Mississippi,
W77-02310 7C

MISSISSIPPI RIVER BASIN
Problem Identification and Ranking, A Selected Review of Techniques Used by Public Agencies,
W77-02080 6B

MISSOURI RIVER
Hydrogeologic Characteristics of the Missouri River Valley Flood Plain,
W77-02194 2F

Strip-Mining Techniques to Minimize Environmental Damage in the Upper Missouri River Basin States,
W77-02445 5G

MIXING
Ways of Preventing Thermal Pollution of Water Bodies by Wastewaters of Nuclear Power Plants, (In Russian),
W77-02271 5G

Transverse Mixing in Natural Channels,
W77-02313 2E

MODEL STUDIES
A Submodel for Nitrogen Release from Sediments,
W77-02099 5B

An Analysis of the Effects of Parameter Uncertainty in Deterministic Hydrologic Models,
W77-02125 2A

A Mixed-Dimension Kinematic Estuarine Model,
W77-02131 2L

A Comparison of Lumped-Parameter and Diffusional Models Describing the Effects of the Outlet Boundary Conditions on the Mixing in Flow Systems,
W77-02147 2L

Swimming of Slender Fish in a Non-Uniform Velocity Field,
W77-02155 2L

Program Report-FY 1975, Atmospheric and Geophysical Sciences Division, Physics Department.
W77-02157 2B

Theoretical Monochromatic-Wave-Induced Currents in Intermediate Water with Viscosity and Nonzero Mass Transport,
W77-02159 2L

Minimizing Costs in Well Field Design in Relation to Aquifer Models,
W77-02161 8B

Water Pollution Investigation: Duluth-Superior Area,
W77-02202 5B

Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

A Model for the Simultaneous Production and Diffusion of Ferrous Iron in Submerged Soils,
W77-02278 2G

A Thermodynamic Model for Predicting the Formation, Stability, and Weathering of Common Soil Minerals,
W77-02285 2G

Simulation of Root-Zone Water and Deep Seepage to a Water Table,
W77-02295 2G

Status of Ground-Water Modeling in the U.S. Geological Survey,
W77-02300 2F

Predicted and Observed Temperature and Water-Quality Changes of Lakes and Reservoirs,
W77-02304 2H

Comparison of Linear Systems and Finite Difference Flow-Routing Techniques,
W77-02319 2E

Modeling Coliform-Bacteria Concentrations and pH in the Salt-Wedge Reach of the Duwamish River Estuary, King County, Washington,
W77-02324 5B

The Application of Fracture Mechanics to the Problem of Crevasse Penetration,
W77-02461 2C

An Evaluation of Parameters for the Theoret cal Distribution of Periods and Amplitudes Sea Waves,
W77-02479 2

The Survival of Ice Particles Falling From Ci rus Clouds in Subsaturated Air,
W77-02488 2

Evolution of Raindrop Spectra with Collisio Induced Breakup,
W77-02489 2

Maryland Highway Drainage Study: Volume - A Linked System Model for the Synthesis Hydrographs in Urban Areas,
W77-02492

Maryland Highway Drainage Study: Volume - An Experimental Examination of the Subs face Drainage of Roadways,
W77-02493

Evapotranspiration Model Tested for Soybe and Sorghum,
W77-02550

MOHAVE DESERT
Competition and Spacing in Plant Commu ties: The Northern Mohave Desert,
W77-02174

MOISTURE AVAILABILITY
Water Flow in Wheat Seedlings After Sm Water Deficits,
W77-02172

Influence of Different Water Regimes on ygen Diffusion Rates, Nutrient Upta Growth and Yield of Wheat,
W77-02177

MOISTURE CONTENT
Water Flow in Wheat Seedlings After Sm Water Deficits,
W77-02172

MOISTURE DEFICIT
Effect of Abscisic Acid at Different Levels Soil Water Potential on the Transpiration Zea Mays,
W77-02121

Water Flow in Wheat Seedlings After Sm Water Deficits,
W77-02172

MOISTURE STRESS
Effect of Abscisic Acid at Different Levels Soil Water Potential on the Transpiration Zea Mays,
W77-02121

Water Flow in Wheat Seedlings After Sm Water Deficits,
W77-02172

Influence of Different Water Regimes on ygen Diffusion Rates, Nutrient Upta Growth and Yield of Wheat,
W77-02177

MOISTURE TENSION
Influence of Different Water Regimes on ygen Diffusion Rates, Nutrient Upta Growth and Yield of Wheat,
W77-02177

MOISTURE UPTAKE
Relative Importance of Soil Resistance Plant Resistance in Root Water Absorption,
W77-02118

Water Flow in Wheat Seedlings After Small Water Deficits,
W77-02172 2D

Influence of Different Water Regimes on Oxygen Diffusion Rates, Nutrient Uptake, Growth and Yield of Wheat,
W77-02177 3F

MOJAVE DESERT
Sodium Relations in Desert Plants: 5. Cation Balance When Grown in Solution Culture and in the Field in Three Species of Lycium from the Northern Mojave Desert,
W77-02178 3C

MOLECULAR STRUCTURE
Configuration Interaction Studies of the Excited States of Water,
W77-02153 1A

MOLECULAR STUDIES
Molecular Studies of the Ice-Forming Capabilities of Different Surfaces,
W77-02487 3B

MOLLUSKS
The Mercury Content of Mollusks in the Pontevedra Estuary as a Measure of its Degree of Mercury Contamination, (In Spanish),
W77-02226 5A

The Role of Mollusks as Benthos Components in Purification of Water Bodies from Ascaris Suum Eggs, (In Russian),
W77-02230 5G

MOMENTUM TRANSFER
Oblique Impingement of Plane Turbulent Jets,
W77-02464 8B

MONITORING
Determination of Small Quantities of Vinyl Acetate in Air, Water, Alcoholic Solutions and Food Products, (In Russian),
W77-02117 5A

Evaluation of the Ring Oven Technique for Water Monitoring,
W77-02148 5A

Revised Department of the Army Pesticide Monitoring Program, I April, 1975,
W77-02203 5A

Compilation of State Data for Eight Selected Toxic Substances, Vol. 1, Final Report,
W77-02204 5G

Some Aspects of Municipal Overflow Reservoir Monitoring, (In Swedish),
W77-02228 5A

Biological Monitoring: Substantiation and Experience in Organization, (In Russian),
W77-02235 5A

Fluid Sampler and Oxygen Meter for Sewage Processing - Biological Oxygen Demand Detailed Continuously by Reaction Vessel Read-Out.
W77-02340 5A

Instantaneous Metering Aids - Activated Sludge Plant,
W77-02381 5A

Alarm System Continually Monitors Plant Functions,

Polyelectrolyte Persistence in a Municipal Water Supply,
W77-02221 5F

Some Aspects of Municipal Overflow Reservoir Monitoring, (In Swedish),
W77-02228 5A

MUSSELS
Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

MYCOLEPTODISCUS TERRESTRIS
Mycoleptodiscus Terrestris Leaf Spot on Waterhyacinth,
W77-02543 5G

MYRIOPHYLLUM
Effect of Salinization on Hydromacrophytes of the Kuban Estuaries, (In Russian),
W77-02255 2L

NASSAU COUNTY (NY)
Preliminary Selection of Storm-Water Basins Suitable for Infiltration of Reclaimed Water in Nassau County, Long Island, New York,
W77-02322 5G

NATIONAL FOREST
Managing the Southwestern National Forests for Water and Related Resources,
W77-02107 4A

NATURAL STREAMS
Transverse Mixing in Natural Channels,
W77-02313 2E

NEOPLASMS (MALIGNANT)
Water Hardness and Incidence of Malignant Neoplasms Among the Population, (In Russian),
W77-02384 5F

NETWORK DESIGN
A Bivariate-Regression Model for Estimating Chemical Composition of Streamflow or Groundwater,
W77-02317 5B

Risk-Safety Factor Relation for Storm Sewer Design,
W77-02551 5D

NEW ENGLAND
Atlantic Offshore Oil: The Need for Planning and Regulation,
W77-02426 6G

Skylab Imagery: Application to Reservoir Management in New England,
W77-02499 4A

NEW JERSEY
Evaluation of Estuarine Site Development Lagoons,
W77-02088 5G

U. OF I. URBANA-CHAMPAIGN

NEW JERSEY

An Evaluation of Water Quality Information: A Case Study of Streams in Metropolitan New Jersey,
W77-02448 5A

NEW MEXICO

Water Quality Impacts of Uranium Mining and Milling Activities in the Grants Mineral Belt, New Mexico,
W77-02208 5G

Water Fowl Refuge Effect on Water Quality: I. Bacterial Populations,
W77-02513 5C

NEW YORK

Distribution of Salinity and Temperature in the Hudson Estuary,
W77-02141 2L

Swimming Participation and Water Quality in Tompkins County, New York,
W77-02185 5G

Preliminary Selection of Storm-Water Basins Suitable for Infiltration of Reclaimed Water in Nassau County, Long Island, New York,
W77-02322 5G

Current Solid Waste Research Activities in New York State,
W77-02398 5E

Evaluation of Circulation in Estuaries,
W77-02456 2L

NEW YORK HARBOR

Evaluation of Circulation in Estuaries,
W77-02456 2L

NIAIDS

A New Technique for Remote Monitoring of Activity of Freshwater Invertebrates with Special Reference Oxygen Consumption by Niaids of Anax Sp. and Somatochlora Sp. (Odonata),
W77-02216 5C

NIGER

Applications of ERTS Products in Range and Water Management Problems, Sahelian Zone: Mali, Upper Volta and Niger,
W77-02167 4A

NITRATE-NITROGEN REMOVAL

Nitrate-Nitrogen Removal from Soil Profiles by Alfalfa,
W77-02290 2G

NITRATE REDUCTASE ACTIVITY

Maximizing Stomatal Control and Root System to Optimize Water-Use Efficiency in Soybeans,
W77-02077 3F

NITRATES

Nitrate-Nitrogen Removal from Soil Profiles by Alfalfa,
W77-02290 2G

Denitrification of Nitrified Septic Tank Effluent,
W77-02347 5D

Nitrate Removal from Water at the Water-Mud Interface in Wetlands,
W77-02441 5G

NITRIFICATION

Identification and Quantification of Water Quality Change Inducting Mechanisms in Stratified Reservoirs,
W77-02089 5C

The Effect of Ammonia and Ammonia-Sulfur Solutions on Nitrification Rates and Chemical Properties of a Calcareous Soil,
W77-02276 2G

Freeing Waste Water from Nitrogenous CPDS - Using Partially Oxidised Sludge as Source of Organic Carbon.
W77-02339 5D

Nitrification in High-Sludge Age Contact Stabilization,
W77-02349 5D

Fluid-Bed Reactor May Cut Sewage Costs.
W77-02367 5D

NITRILOTRIACETIC ACID

Degradation of NTA Acid During Anaerobic Digestion,
W77-02364 5D

NITRITES

Initial Release of Nitrogen from Ureaform Under Field Conditions,
W77-02279 3F

NITROGEN

A Submodel for Nitrogen Release from Sediments,
W77-02099 5B

Sulfur Fractions and Carbon-Nitrogen-Phosphorus-Sulfur Relationships in Some Brazilian and Iowa Soils,
W77-02102 2G

Nitrogen in the Soil Water of the Ecosystem of the Amazonian Prairies, (In Portugese),
W77-02239 5B

Initial Release of Nitrogen from Ureaform Under Field Conditions,
W77-02279 3F

Crop Production Function Determinations as Influenced by Irrigation and Nitrogen Fertilization Using a Continuous Variable Design,
W77-02281 3F

Environmental Implications of N Fixation by Soybeans,
W77-02289 3C

Nitrate-Nitrogen Removal from Soil Profiles by Alfalfa,
W77-02290 2G

A Comparison of Nitrogen, Phosphorus, and Carbon in Sediments and Soils of Cultivated and Noncultivated Watersheds in the North Central States,
W77-02292 5G

Nitrogen Losses from Soils of the North Carolina Coastal Plain,
W77-02294 5B

Bio-Refractory Index for Organics in Water,
W77-02520 5A

NITROGEN COMPOUNDS

Freeing Waste Water from Nitrogenous CPDS - Using Partially Oxidised Sludge as Source of Organic Carbon.
W77-02339 5D

Nitrification in High-Sludge Age Contact Stabilization,
W77-02349 5D

Studies of the Removal of Ammonia Nitrogen by Ion Exchange,
W77-02370 5D

NITROGEN FIXATION

Nitrogen Fixation by Algae in Fescuegrass Soil Crusts,
W77-02274 2G

Environmental Implications of N Fixation by Soybeans,
W77-02289 3C

NITROGEN RELEASE

A Submodel for Nitrogen Release from Sediments,
W77-02099 5B

NITROGEN REMOVAL

Septic Tank Effluent Movement Through Soil,
W77-02087 5B

NONPOINT POLLUTION SOURCES

Nonpoint-Source Pollution in Surface Waters: Associated Problems and Investigative Techniques.
W77-02444 5B

NORTH ATLANTIC SLOPE BASINS

Surface Water Supply of the United States, 1966-70: Part 1. North Atlantic Slope Basins--Volume 3. Basins from Maryland to York River.
W77-02307 7C

NORTH CAROLINA

Controlling Erosion and Sedimentation at Construction Sites,
W77-02146 4D

Water Resource Problems and Research Needs of North Carolina,
W77-02181 9D

Nitrogen Losses from Soils of the North Carolina Coastal Plain,
W77-02294 5F

Use of Waste Heat for Soil Warming in North Carolina,
W77-02532 5F

NORWAY

Analgological Survey of the Sondeledfjord Near Risor, S. Norway: A 'Land-Locked Fjord Exposed to Pollution, (In Norwegian),
W77-02252 5F

The Origin of Glacially Fluted Surfaces - Observations and Theory,
W77-02465 2C

NOSY-BE

Zooplankton of the Region of Nosy-Be: VI Pteropods, Heteropods: I. Holoneritic and Internal-Neritic Species; Contribution to the Study of a Tropical Eutrophic Bay. (In French),
W77-02416 5C

NUCLEAR POWERPLANTS

Water Use Implications for Nuclear Power Stations in the United States of America,
W77-02114 6C

Ways of Preventing Thermal Pollution of Water Bodies by Wastewaters of Nuclear Power Plants, (In Russian),
W77-02271 5C

NUCLEATION

Molecular Studies of the Ice-Forming Capabilities of Different Surfaces,
W77-02487 3I

NUMERICAL ANALYSIS
Numerical Solution of Boussinesq Equation,
W77-02143 2F

NUTRIENT INACTIVATION
Studies on Lake Restoration by Phosphorus Inactivation,
W77-02442 5G

NUTRIENT-POOR RIVERS
A Sensitive Algal Assay: An Improved Method for Analysis of Freshwaters,
W77-02524 5A

NUTRIENT REMOVAL
Septic Tank Effluent Movement Through Soil,
W77-02087 5B

Changes in Benthos and Fishes of a Stream Accompanying a Substantial Reduction in Plant Nutrients,
W77-02191 5C

Eagle Lake Pollution Control Project, Eagle Lake Kandiyohi County, Minnesota, Bench Mark Studies,
W77-02215 5G

Nitrate-Nitrogen Removal from Soil Profiles by Alfalfa,
W77-02290 2G

Removal Benefits: It Can Be Too Costly,
W77-02436 5D

Phosphate Reduction and Response of Plankton Populations in Kootenay Lake,
W77-02440 5C

Studies on Lake Restoration by Phosphorus Inactivation,
W77-02442 5G

NUTRIENT REQUIREMENTS
Nutritional Ecology of Nuisance Aquatic Plants,
W77-02451 5C

NUTRIENTS
Crop Production Function Determinations as Influenced by Irrigation and Nitrogen Fertilization Using a Continuous Variable Design,
W77-02281 3F

Interactions of Micronutrients in Barley Grown on Zinc-Polluted Soils,
W77-02287 2G

Nutrient Dilution-Antagonism Effects in Corn and Snap Beans in Relation to Rate and Source of Applied Potassium,
W77-02288 3F

Nitrogen Losses from Soils of the North Carolina Coastal Plain,
W77-02294 5B

Surveying America's Lakes.
W77-02375 5C

Mathematical Modeling of Phytoplankton in Lake Ontario. Part 2. Simulations Using Lake 1 Model,
W77-02443 5C

Nutritional Ecology of Nuisance Aquatic Plants,
W77-02451 5C

Some Effects of the Aswan High Dam on Water and Fishes of Lake Borullus, A. R. E.,
W77-02512 5C

Seasonal Variations of Temperature and Nutrients in the Surface Waters of Lakes Ontario and Erie,
W77-02515 5C

Nutrient Distributions in a Spodosol During Corn Growth,
W77-02516 5B

OBLIQUE IMPINGEMENT
Oblique Impingement of Plane Turbulent Jets,
W77-02464 8B

OCEAN CIRCULATION
Tracking a Gulf Stream Ring With SOFAR Floats,
W77-02139 2L

Gulf Stream Kinematics Inferred from a Satellite-Tracked Drifter,
W77-02140 2L

OCEANS
Tracking a Gulf Stream Ring With SOFAR Floats,
W77-02139 2L

Gulf Stream Kinematics Inferred from a Satellite-Tracked Drifter,
W77-02140 2L

Ocean Dumping Phase-Out in EPA Region II,
W77-02393 5E

International Seabed Regime: India's Interests and Policy Options,
W77-02424 6E

Spectral Characteristics of the Microwave Emission from a Wind-Driven Foam-Covered Sea,
W77-02476 2L

Rare Earth Element Supply to the Ocean,
W77-02478 2L

A Technique for Estimating Tropical Open-Ocean Rainfall from Satellite Observations,
W77-02484 2B

OCTYLIC STABILIZERS
Hygienic Standardization of Octylic Stabilizers of Polyvinylchloride in Water Bodies, (In Russian),
W77-02264 5G

OFFSHORE OIL FIELDS
Atlantic Offshore Oil: The Need for Planning and Regulation,
W77-02426 6G

OFFSHORE PLATFORMS
On the Reliability of the Spectral Method for the Design of Offshore Structures,
W77-02129 8B

OGALLALA FORMATION (GREAT PLAINS)
A Bioeconomic Simulation Analysis of Regulating Groundwater Irrigation,
W77-02549 3F

OIL BIODEGRADATION
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

OIL FIELDS
Atlantic Offshore Oil: The Need for Planning and Regulation,
W77-02426 6G

OIL POLLUTION
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

Case of Subsurface Water Pollution by Petroleum Product Wastes, (In Russian),
W77-02273 5B

OIL SPILLS
Economic Effects of Enforcement Variables on Commercial Oil Pollution Control Strategy,
W77-02418 5G

OIL WASTES
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

Occurrence of Kerosene-Like Hydrocarbons in the Bream, Mylio Australis Gunther,
W77-02212 5C

Case of Subsurface Water Pollution by Petroleum Product Wastes, (In Russian),
W77-02273 5B

OLIGOCHAETES
Tubificids (Oligochaeta: Tubificidae) - Indicators of the Quality of Water Bodies, (In Russian),
W77-02225 5A

Toxicological Characteristics of Acute Phenol Intoxication in Some Freshwater Worms, (In Russian),
W77-02237 5C

OLIGOTROPHY
Elements of Limnological Specificity of Large Lakes in the Temperate Zone, (In Russian),
W77-02260 2H

OLKOVAYE RESERVOIR (USSR)
Effect of Mine Wastewaters on the Water Quality of the Ol'khovoye Reservoir, (In Russian),
W77-02242 5C

ON-SITE INVESTIGATIONS
The Origin of Glacially Fluted Surfaces - Observations and Theory,
W77-02465 2C

A Note on the Contribution of Rime and Surface Hoar to the Accumulation on the Ross Ice Shelf, Antarctica,
W77-02469 2C

ON-SITE TESTS
Open Tank Pure Oxygen System Begins Operation,
W77-02359 5D

ONCOMELANIID SNAILS
The Role of Silt in Eradication of Oncomelaniid Snails in Grassy Beaches, (In Chinese).
W77-02245 5G

ONE DIMENSIONAL
Mathematical Models in Hydraulics and Coastal Engineering,
W77-02471 2A

ONSHORE IMPACT
Atlantic Offshore Oil: The Need for Planning and Regulation,
W77-02426 6G

ONTARIO (CANADA)
Economic and Environmental Impacts of Agricultural Land Drainage in Ontario,
W77-02425 4A

Water Resources Scientific Information Center
U. S. Dept. of the Interior
Washington, D. C. 20240

OPERATING POLICY
Operation of a Reservoir Collecting Water from a Small Watershed,
W77-02126 4A

OPPORTUNITY COST THEORY
Principles of Determining a Social Discount Rate,
W77-02518 6B

OPTIMIZATION
Mathematical Models for Use in Planning Regional Water Resources and Energy Systems,
W77-02079 6A

Operation of a Reservoir Collecting Water from a Small Watershed,
W77-02126 4A

ORANGE COUNTY (FLA)
Ground-Water Hydrology of the Cocoa Well-Field Area, Orange County, Florida,
W77-02323 4B

OREGON
Project Development and Data Programs for Assessing the Quality of the Willamette River, Oregon,
W77-02301 2E

OREL RIVER (USSR)
Hydrochemical Characteristics of the Orel River, (In Russian),
W77-02234 5A

ORGANIC CARBON (SOLUBLE)
Correlation of BOD, COD and Soluble Organic Carbon,
W77-02376 5A

ORGANIC COMPOUNDS
Hygienic Standardization of Diethylbenzene in Water Bodies, (In Russian),
W77-02152 5G

Occurrence of Kerosene-Like Hydrocarbons in the Bream, Mylio Australis Gunther,
W77-02212 5C

Correlation of BOD, COD and Soluble Organic Carbon,
W77-02376 5A

Determination of Chemical Oxygen Demand (Die Bestimmung Der Chemischen Oxidierbarkeit),
W77-02380 5A

Bio-Refractory Index for Organics in Water,
W77-02520 5A

Organic Compounds in Pulp Mill Lagoon Discharge,
W77-02558 5A

ORGANIC MATTER
Interactions of Ferric and Ferrous Irons and Organic Matter in Water Environment,
W77-02389 5B

ORGANIC WASTES
Dynamics of the Content of Some Organic Toxic Substances in Plants Irrigated with Effluents of the Coal-Tar Chemical Industry, (In Russian),
W77-02263 5C

ORGANOLEPTIC PROPERTIES
Occurrence of Kerosene-Like Hydrocarbons in the Bream, Mylio Australis Gunther,
W77-02212 5C

Removal Benefits: It Can Be Too Costly,
W77-02436 5D

OUTBOARD MOTOR EMISSIONS
Analysis of Pollution from Marine Engines and Effects on the Environment. Summary Report.
W77-02449 5C

OUTLETS
The Design and Construction of a Screening and Pumping Station and an Outfall for the Disposal of Sewage from Brighton and Hove,
W77-02331 5E

Dilution and Design,
W77-02332 5E

OVERDRAFT
The Copper Industry and Water in Arizona,
W77-02166 3E

OVERFLOW
Some Aspects of Municipal Overflow Reservoir Monitoring. (In Swedish).
W77-02228 5A

OVERLAND FLOW
A Model for Predicting Flood Hazards Due to Specific Land-Use Practices,
W77-02078 2A

OXIDATION
Thermophillic Bio-Oxidation of High-Strength Organic Wastewaters and Sludges,
W77-02369 5D

Aspects of Sludge Treatment,
W77-02372 5D

A Discourse on the Biochemical Oxidation of Sewage,
W77-02373 5D

Determination of Chemical Oxygen Demand (Die Bestimmung Der Chemischen Oxidierbarkeit),
W77-02380 5A

OXIDATION-REDUCTION POTENTIAL
Caloric Investigations on the Shore Community of a Fish Pond, (In German),
W77-02336 2H

Nitrate Removal from Water at the Water-Mud Interface in Wetlands,
W77-02441 5G

OXYGEN BLEACHING
Investigations of Effluent Characteristics from Conventional and Oxygen Bleaching Sequences: Results of Laboratory Studies,
W77-02563 5D

OXYGEN CONSUMPTION (NIAIDS)
A New Technique for Remote Monitoring of Activity of Freshwater Invertebrates with Special Reference Oxygen Consumption by Niaids of Anax Sp. and Somatochlora Sp. (Odonata),
W77-02216 5C

OXYGEN DEMAND
Bio-Refractory Index for Organics in Water,
W77-02520 5A

OXYGEN DEMANDS
Water Pollution Investigation: Duluth-Superior Area,
W77-02202 5B

OXYGEN ISOTOPES
The Determination of Seasonal Variations in Groundwater Recharge by Deuterium and Oxygen-18 Analysis for the Tucson Basin, Arizona,
W77-02169 2F

OXYGEN SAG
Water Pollution Investigation: Duluth-Superior Area,
W77-02202 5B

OXYGENATION
Open Tank Pure Oxygen System Begins Operation,
W77-02359 5D

Efficiency of Diffused Aeration Systems in Wastewater Treatment,
W77-02362 5D

OYSTERS
Growth Factors on Oyster and Water Pollution in South Coastal Area in Korea, (In Korean),
W77-02257 5C

OZONE
Ozone and Vascular Tissue Differentiation in Plants,
W77-02439 5C

Ozone Removal from Arc Lamp Cooling Air,
W77-02511 7B

PACIFIC NORTHWEST U.S.
An Operational Application of Satellite Snow Cover Observations - Northwest United States,
W77-02496 2C

PACIFIC OCEAN
Distribution of Carbonate in Surface Sediments of the Pacific Ocean,
W77-02134 2L

The Effect of the Geostrophic Flow Upon Coastal Sea Elevations in the Northern North Pacific Ocean,
W77-02477 2L

A Technique for Estimating Tropical Open-Ocean Rainfall from Satellite Observations,
W77-02484 2F

PARAMETRIC HYDROLOGY
An Analysis of the Effects of Parameter Uncertainty in Deterministic Hydrologic Models,
W77-02125 2A

PARROTS-FEATHER
Parrot's-Feather (Myriophyllum Aquaticum (Vell.) Verdc.), an Aggressive Water Weed in Portugal, (In Portuguese),
W77-02247 5G

PATENTS
Suspended Sludge Scraper for Arcuate Sedimentation Zone,
W77-02335 5D

Clarification Plant,
W77-02337 5D

Freeing Waste Water from Nitrogenous CPDS Using Partially Oxidised Sludge as Source of Organic Carbon.
W77-02339 5D

Fluid Sampler and Oxygen Meter for Sewage Processing - Biological Oxygen Demand Detailed Continuously by Reaction Vessel Read-Out.
W77-02340 5A

Combined Filter and Dryer for Sewage Sludge Etc. - Uses Band of Vacuum Filter to Carry Cake Through Filter Press.
W77-02341 5D

Sewage Surface Aerator - Without Axial Thrust Thus Reducing Vibration from Waves
W77-02342 5D

Treatment of Papermaking Effluents (Traitement d'effluents de papeteries),
W77-02570 5D

PATH OF POLLUTANTS
Septic Tank Effluent Movement Through Soil,
W77-02087 5B

Oxygen in a Tidal River: Low Tide Concentration Correlates Linearly with Location,
W77-02145 2L

An Ecosystem Analysis of Environmental Contamination by Lead,
W77-02211 5A

Exchange of Nutrients and Trace Metals Between Marsh Sediments and Estuarine Waters - A Field Study,
W77-02217 5B

Modeling Coliform-Bacteria Concentrations and pH in the Salt-Wedge Reach of the Duwamish River Estuary, King County, Washington,
W77-02324 5B

Movement of Heavy Metals Below Sewage Disposal Ponds,
W77-02379 5B

Theoretical Approach to Gas Movement Through Soils,
W77-02401 5B

Leachate Attenuation in Undisturbed and Remoulded Soils,
W77-02403 5B

Organic Pollutants Contributed to Groundwater by a Landfill,
W77-02407 5B

Case History of Landfill Gas Movement Through Soils,
W77-02413 5E

Nutrient Distributions in a Spodosol During Corn Growth,
W77-02516 5B

Modeling Reactions and Transport of Potassium in Soils,
W77-02529 5B

Distributions of 2,4-D and Water in Soil During Infiltration and Redistribution,
W77-02542 5B

PATHOGENS
Cercospora Rodmanii, A New Pathogen of Water Hyacinth with Biological Control Potential,
W77-02540 5G

PEAT
Thurrock Beats Peat with Piled Pipes,
W77-02328 8E

PENNSYLVANIA
Changes in Benthos and Fishes of a Stream Accompanying a Substantial Reduction in Plant Nutrients,
W77-02191 5C

PERMEABILITY
An Effect of Permeability on Sand Transport by Waves,
W77-02508 2L

Detection of Subsurface Solution Cavities in Florida Using Electrical Resistivity Measurements,
W77-02517 2F

Sedimentology and Paleoecology of Middle and Upper Eocene Carbonate Shoreline Sequences, Crystal River, Florida, U.S.A.,
W77-02545 2F

PESTICIDE RESIDUES
Revised Department of the Army Pesticide Monitoring Program, I April, 1975,
W77-02203 5A

PESTICIDES
Revised Department of the Army Pesticide Monitoring Program, I April, 1975,
W77-02203 5A

Distributions of 2,4-D and Water in Soil During Infiltration and Redistribution,
W77-02542 5B

The Use of Tenax for the Extraction of Pesticides and Polychlorinated Biphenyls from Water. II. Tests with Artificially Polluted and Natural Waters,
W77-02561 5G

PETROGRAPHY
Sedimentology and Paleoecology of Middle and Upper Eocene Carbonate Shoreline Sequences, Crystal River, Florida, U.S.A.,
W77-02545 2F

PHENOLS
Toxicological Characteristics of Acute Phenol Intoxication in Some Freshwater Worms, (In Russian),
W77-02237 5C

PHOENIX (ARIZ)
Transient Movement of Water and Solutes in Unsaturated Soil Systems, Phase II,
W77-02189 2G

PHORMIDIUM LURIDUM
The Effect of Selenite on the Physiological and Morphological Properties of the Blue-Green Alga Phormidium Luridum Var. Olivacea,
W77-02546 5C

PHOSPHATE LOAD REDUCTION
Phosphate Reduction and Response of Plankton Populations in Kootenay Lake,
W77-02440 5C

PHOSPHATES
Rate of Dissolution of Phosphate from Minerals and Soils,
W77-02275 2G

Phosphorus Removal with Alum from Secondary Effluent,
W77-02346 5D

Phosphate Reduction and Response of Plankton Populations in Kootenay Lake,
W77-02440 5C

PHOSPHOROUS
Exchange of Nutrients and Trace Metals Between Marsh Sediments and Estuarine Waters - A Field Study,
W77-02217 5B

PHOSPHORUS
Effects of Phosphorus on Some Physical and Chemical Properties of Clays,
W77-02101 2G

Sulfur Fractions and Carbon-Nitrogen-Phosphorus-Sulfur Relationships in Some Brazilian and Iowa Soils,
W77-02102 2G

Effects on the Phosphorous Situation in Lake Radasjon on Changes in the Pollution Situation, (In Swedish),
W77-02227 5C

A Comparison of Nitrogen, Phosphorus, and Carbon in Sediments and Soils of Cultivated and Noncultivated Watersheds in the North Central States,
W77-02292 5G

Comparison of Methods for the Determination of Total Phosphorus in Waters Containing Particulate Material,
W77-02293 5A

Phosphorus Removal with Alum from Secondary Effluent,
W77-02346 5D

Polymers Cut Cost of Phosphorus Removal,
W77-02374 5D

Surveying America's Lakes.
W77-02375 5C

PHOSPHORUS COMPOUNDS
Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Phosphorus Derived Chemicals Segment of the Phosphate Manufacturing Point Source Category,
W77-02431 5G

PHOSPHORUS INACTIVATION
Studies on Lake Restoration by Phosphorus Inactivation,
W77-02442 5G

PHOSPHORUS REMOVAL
Septic Tank Effluent Movement Through Soil,
W77-02087 5B

PHOTOMETRY
Extraction-Photometric Determination of Mercury in Soil and Water, (In Russian),
W77-02272 5A

PHOTOSYNTHESIS
Production of Phytoplankton of Lake Baikal in the Region of Listvennichnoye Village, (In Russian),
W77-02253 5C

Elements of Limnological Specificity of Large Lakes in the Temperate Zone, (In Russian),
W77-02260 2H

PHYSICAL CONTROL
Coleshill Advanced Wastewater Treatment Project,
W77-02344 5D

PHYSICAL PROPERTIES
Toward a More Meaningful Index of Sludge Quality,
W77-02378 5G

Snow Pressure on Rigid Obstacles,
W77-02463 2C

PHYTOPLANKTON
Hydrochemical Characteristics of the Orel River, (In Russian),
W77-02234 5A

Influence of Mercury, Lead, Cadmium and Copper on Primary Production and Phytoplankton in Some Coastal Areas of the Mediterranean and Red Seas, (In Russian),
W77-02249 5C

PHYTOPLANKTON

Production of Phytoplankton of Lake Baikal in the Region of Listvennichnoye Village, (In Russian),
W77-02253 5C

Effects of Waterhyacinth Cover on Water Chemistry, Phytoplankton, and Fish in Ponds,
W77-02291 5G

Mathematical Modeling of Phytoplankton in Lake Ontario. Part 2. Simulations Using Lake 1 Model,
W77-02443 5C

PHYTOTOXICITY

Case History of Landfill Gas Movement Through Soils,
W77-02413 5E

PILES (FOUNDATION)

Thurrock Beats Peat with Piled Pipes,
W77-02328 8E

PILOT PLANTS

Pilot Plant Travels on Wheels.
W77-02366 5D

PIPERIDINE

The Barrier Role of Water Treatment Installations with Respect to Certain Heterocyclic Compounds, (In Russian),
W77-02240 5F

PIPES

Risk-Safety Factor Relation for Storm Sewer Design,
W77-02551 5D

PLANKTON

The Effect of Current Velocity and Changes in Water Level on the Composition of the Planktonic Ciliate Population of the Danube River, (In Hungarian),
W77-02236 5C

PLANNING

Mathematical Models for Use in Planning Regional Water Resources and Energy Systems,
W77-02079 6A

Problem Identification and Ranking, A Selected Review of Techniques Used by Public Agencies.
W77-02080 6B

The Arizona Water Plan: A Status Report,
W77-02104 4D

Atlantic Offshore Oil: The Need for Planning and Regulation,
W77-02426 6G

PLANT GROUPINGS

Competition and Spacing in Plant Communities: The Northern Mohave Desert,
W77-02174 2I

PLANT GROWTH

Competition and Spacing in Plant Communities: The Northern Mohave Desert,
W77-02174 2I

PLANT GROWTH REGULATORS

Algal Metabolite Influence on Bloom Sequence in Eutrophied Freshwater Ponds,
W77-02438 5C

PLANT GROWTH SUBSTANCES

Algal Metabolite Influence on Bloom Sequence in Eutrophied Freshwater Ponds,
W77-02438 5C

PLANT PATHOGEN

Use of Plant Pathogens for Bioregulation of Aquatic Macrophytes,
W77-02514 5G

PLANT PATHOGENS

Mycoleptodiscus Terrestris Leaf Spot on Waterhyacinth,
W77-02543 5G

PLANT PATHOLOGY

Evaluation of Cercospora Rodmanii as a Biological Control of Waterhyacinths,
W77-02528 5G

PLANTING MANAGEMENT

Kelp Habitat Improvement Project,
W77-02417 2L

PLASTIC PIPES

Plastic Lining Overcomes Rugged Terrain,
W77-02333 8G

Effect of Polyvinyl Chloride on Water Microflora, (In Russian),
W77-02386 5C

PLASTICITY INDEX

Scouring of Cohesive Soils,
W77-02127 2J

PLASTICS

Packaged Plant for Virgin Islands.
W77-02360 8G

Sandwich Construction G.R.P.
W77-02368 8G

POECILA-RETICULATA

Studies on the Tolerance of the Guppy, Poecilia Reticulata (Peters), a Natural Enemy of Mosquito Larvae, to the Septic Pollution of Water, (In Japanese),
W77-02238 5C

POLARIZATION

Electrode Kinetics of Antimony in Acidic Chloride Solutions,
W77-02533 3A

POLIO VIRUS

Factors Affecting the Adsorption of Polio Virus to Magnetite in Water and Wastewater,
W77-02530 5D

POLIOVIRUS

Laser Methods of Rapid Detection, Identification and Quantitation of Human Enteric Viruses in Sewage and Rivers,
W77-02184 5A

Removal of Viruses from Water by Magnetic Filtration,
W77-02214 5D

POLLUTANT IDENTIFICATION

Determination of Small Quantities of Vinyl Acetate in Air, Water, Alcoholic Solutions and Food Products, (In Russian),
W77-02117 5A

Evaluation of the Ring Oven Technique for Water Monitoring,
W77-02148 5A

Evaluation of the Ring Oven Technique for Water Monitoring, Appendices,
W77-02149 5A

Fecal Coliform Analysis: Effects of Elevated Temperatures on Quantitative Recovery,
W77-02182 5A

Water-Borne Viruses: Their Characterization by Raman Spectroscopy,
W77-02183 5A

Laser Methods of Rapid Detection, Identification and Quantitation of Human Enteric Viruses in Sewage and Rivers,
W77-02184 5A

Optical Remote Sensing of Water Pollutants,
W77-02192 5A

Occurrence of Kerosene-Like Hydrocarbons in the Bream, Mylio Australis Gunther,
W77-02212 5C

Polyelectrolyte Persistence in a Municipal Water Supply,
W77-02221 5F

Tubificids (Oligochaeta: Tubificidae) - Indicators of the Quality of Water Bodies, (In Russian),
W77-02225 5A

The Mercury Content of Mollusks in the Pontevedra Estuary as a Measure of its Degree of Mercury Contamination, (In Spanish),
W77-02226 5A

Some Aspects of Municipal Overflow Reservoir Monitoring, (In Swedish),
W77-02228 5A

Emission Spectrometic Element Determination in the Nano- and Picogram Region After Vaporization of the Elements with Gas Plasmas Induced with Microwaves: 1. Extremely Sensitive Mercury Determination in Aqueous Solutions, Air Organic and Inorganic Materices, (In German),
W77-02229 5A

Hydrochemical Characteristics of the Orel River, (In Russian),
W77-02234 5A

Biological Monitoring: Substantiation and Experience in Organization, (In Russian),
W77-02235 5A

Effect of River Pollution on Aquatic Beetles, (In Russian),
W77-02261 5A

Extraction-Photometric Determination of Mercury in Soil and Water, (In Russian),
W77-02272 5A

Case of Subsurface Water Pollution by Petroleum Product Wastes, (In Russian),
W77-02273 5B

Comparison of Methods for the Determination of Total Phosphorus in Waters Containing Particulate Material,
W77-02293 5A

Fluid Sampler and Oxygen Meter for Sewage Processing - Biological Oxygen Demand Detailed Continuously by Reaction Vessel Read-Out.
W77-02340 5A

Correlation of BOD, COD and Soluble Organic Carbon,
W77-02376 5A

Determination of Chemical Oxygen Demand (Die Bestimmung Der Chemischen Oxidierbarkeit),
W77-02380 5A

Instantaneous Metering Aids - Activated Sludge Plant,
W77-02381 5A

A Study of Bacterial Aerosols at a Wastewater Irrigation Site,
W77-02392 5A

Analytical Methodologies for Leachate and Gas Analysis,
W77-02402 5A

Variations in Gas and Leachate Production from Baled and Non-Baled Municipal Refuse,
W77-02404 5E

Gas and Leachate Generation in Various Solid Waste Environments,
W77-02405 5E

Monitoring Toxic Chemicals in Land Disposal Sites,
W77-02409 5A

Nonpoint-Source Pollution in Surface Waters: Associated Problems and Investigative Techniques.
W77-02444 5B

Direct of X-Ray Spectrometric Determination of Bromine in Water,
W77-02457 5A

Monitoring Water Quality From LANDSAT.
W77-02494 5A

Remote Sensing of Effects of Land-Use Practices on Water Quality,
W77-02497 5A

SKYLAB Study of Water Quality,
W77-02505 5A

Bio-Refractory Index for Organics in Water,
W77-02520 5A

Environment and Pollutions. Sources, Health Effects, Monitoring and Control,
W77-02521 5G

Lipids of Smittium Culisetae,
W77-02547 5A

Organic Compounds in Pulp Mill Lagoon Discharge,
W77-02558 5A

The Use of Tenax for the Extraction of Pesticides and Polychlorinated Biphenyls from Water. II. Tests with Artificially Polluted and Natural Waters,
W77-02561 5G

Chemical Catalyst Interference in the Winkler Titration Determination of Dissolved Oxygen -- A Method for Correction,
W77-02564 5A

)LLUTANT INDENTIFICATION

Revised Department of the Army Pesticide Monitoring Program, I April, 1975,
W77-02203 5A

)LLUTION ABATEMENT

State Consideration of the Rivers Zeta and Moraca Based on the Chemical Control, (In Serbo-Croatiau),
W77-02266 5G

Measures for the Protection of the Rivers Zeta nd Moraca, (In Serbo-Croatiiau),
W77-02267 5G

Ways of Preventing Thermal Pollution of Water Bodies by Wastewaters of Nuclear Power Plants, (In Russian),
W77-02271 5G

POLLUTION TAXAS (CHARGES)

A Comprehensive Systems Engineering Study of the True Economic Value of Unpolluted Water Versus Varying Degrees of Polluted Water,
W77-02220 5G

POLYCHAETES

Detrital Utilization by the Polychaete, Capitella Capitata,
W77-02435 5C

POLYCHLORINATED BIPHENYLS

Compilation of State Data for Eight Selected Toxic Substances, Vol. 1, Final Report,
W77-02204 5G

Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

The Use of Tenax for the Extraction of Pesticides and Polychlorinated Biphenyls from Water. II. Tests with Artificially Polluted and Natural Waters,
W77-02561 5G

POLYELECTROLYTES

Polyelectrolyte Persistence in a Municipal Water Supply,
W77-02221 5F

POLYMERS

Polymers Cut Cost of Phosphorus Removal,
W77-02374 5D

POLYVINYL CHLORIDE

Effect of Polyvinyl Chloride on Water Microflora, (In Russian),
W77-02386 5C

POLYVINYLCHLORIDES

Hygienic Standardization of Octylic Stabilizers of Polyvinylchloride in Water Bodies, (In Russian),
W77-02264 5G

POROSITY

Detection of Subsurface Solution Cavities in Florida Using Electrical Resistivity Measurements,
W77-02517 2F

Sedimentology and Paleoecology of Middle and Upper Eocene Carbonate Shoreline Sequences, Crystal River, Florida, U.S.A.,
W77-02545 2F

POROUS MEDIA

A Study of the Physicochemical Parameters Affecting the Removal of Colloidal Particles from Water by Porous Media,
W77-02086 5D

On the Species Transport Equation for Flow in Porous Media,
W77-02452 2F

Transport of Mass and Energy in Porous Media Due to Natural Convection--The Geothermal Basin Problem,
W77-02507 4B

PORTUGAL

Parrot's-Feather (Myriophyllum Aquaticum (Vell.) Verdc.), an Aggressive Water Weed in Portugal, (In Portuguese),
W77-02247 5G

POTABLE WATER

Need for Fluoridation of Drinking Water in Krasnodon, (In Russian),
W77-02338 5F

POTAMOGETON-PECTINATUS

Effect of Salinization on Hydromacrophytes of the Kuban Estuaries, (In Russian),
W77-02255 2L

POTASSIUM

Potassium-Calcium Exchange Equilibria in Volcanic-Ash Soils,
W77-02277 2G

Dissolution of Illite--A Possible Mechanism of Potassium Release,
W77-02283 2G

Nutrient Dilution-Antagonism Effects in Corn and Snap Beans in Relation to Rate and Source of Applied Potassium,
W77-02288 3F

Potassium in an Arid Loessial Soil: Characterization by Equilibrium Release-Absorption to Strong Salt Solutions,
W77-02296 2G

Modeling Reactions and Transport of Potassium in Soils,
W77-02529 5B

POTASSIUM-CALCIUM EXCHANGE EQUILIBRIA

Potassium-Calcium Exchange Equilibria in Volcanic-Ash Soils,
W77-02277 2G

POTENTIAL WATER SUPPLY

Prospects for an Agro-Industrial Complex on the Gaza-Sinai Sea Coast,
W77-02115 3A

POTOMAC RIVER

A Mixed-Dimension Kinematic Estuarine Model,
W77-02131 2L

The Circulation and Salinity Distribution of the Upper Potomac Estuary,
W77-02132 2L

POWERPLANTS

Mathematical Models for Use in Planning Regional Water Resources and Energy Systems,
W77-02079 6A

PRANDTL NUMBERS

Turbulent Transport to a Rotation Cylinder for Large Prandtl or Schmidt Numbers,
W77-02534 3A

PRAWNS

The Aquaculture of Fresh Water Prawns, Macrobrachium Species,
W77-02209 3E

PRE-IMPOUNDMENT

Simulated Effects of the Proposed Tennessee Colony Reservoir on Ground-Water Conditions in the Carrizo-Wilcox Aquifer and Trinity River Alluvium, Texas,
W77-02305 4A

U. OF I. URBANA-CHAMPAIGN

PRECIPITATION (ATMOSPHERIC)
Inadvertent Weather Modification,
W77-02453 3B

Climatic Inferences from Former Glaciers in the South-East Grampian Highlands, Scotland,
W77-02467 2C

The Annual Volume of U.S. Precipitation and its Variations for the Period 1931-1971,
W77-02483 2B

PRECIPITATION EXCESS
A Model for Predicting Flood Hazards Due to Specific Land-Use Practices,
W77-02078 2A

PRECIPITATION VARIATIONS
The Annual Volume of U.S. Precipitation and its Variations for the Period 1931-1971,
W77-02483 2B

PRESSURE
Test New Sewers with Low-Pressure Air,
W77-02329 8G

Oblique Impingement of Plane Turbulent Jets,
W77-02464 8B

PRESSURIZED IRRIGATION SYSTEMS
The Economics of Pressurized Irrigation Systems for Mature Citrus Orchards in Southwestern Arizona,
W77-02165 3F

PRIMARY PRODUCTIVITY
Influence of Mercury, Lead, Cadmium and Copper on Primary Production and Phytoplankton in Some Coastal Areas of the Mediterranean and Red Seas, (In Russian),
W77-02249 5C

PRINTING INDUSTRY
Environmental Aspects of Chemical Use in Printing Operations, (September 22-24, 1975, King of Prussia, PA.), Conference Proceedings.
W77-02553 5C

PRODUCTIVITY
Effect of Exogenous Amino Acids on Productivity of Certain Higher Hydrophytes, (In Russian),
W77-02251 5C

PROJECT PLANNING
Utility of Urban Runoff Modeling, (Proceedings of a Special Session, Spring Annual Meeting, American Geophysical Union, Washington, D.C. 14 April 1976.
W77-02076 2A

Project Development and Data Programs for Assessing the Quality of the Willamette River, Oregon,
W77-02301 2E

PROJECTS
Program Report-FY 1975, Atmospheric and Geophysical Sciences Division, Physics Department.
W77-02157 2B

Fourth Semiannual Interagency Briefing, February 1975, Washington, D.C.,
W77-02158 8G

PROPERTY RIGHTS
Old Answers to 'New' Problems: Henry George, Property Rights and Environmental Quality,
W77-02539 6B

PROTAZOA
The Effect of Current Velocity and Changes in Water Level on the Composition of the Planktonic Ciliate Population of the Danube River, (In Hungarian),
W77-02236 5C

PROTOZOA
Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

PRUDHOE CRUDE OIL
Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

PUBLIC HEALTH
Water-Borne Viruses: Their Characterization by Raman Spectroscopy,
W77-02183 5A

Sanitary-Hygienic Evaluation of the Recycled Water Supply on Railroads, (In Russian),
W77-02241 3F

Water Hardness and Incidence of Malignant Neoplasms Among the Population, (In Russian),
W77-02384 5F

Environmental Aspects of Chemical Use in Printing Operations, (September 22-24, 1975, King of Prussia, PA.), Conference Proceedings
W77-02553 5C

PUERTO RICO
Current Solid Waste Management Activities in Puerto Rico,
W77-02399 5E

PULP AND PAPER INDUSTRY
C(rown) Z(ellerbach)'s Solids Waste Problems at Wauna are Reduced by Composting,
W77-02572 5E

PULP WASTES
An Experimental High-Ash Paper Mill Sludge Landfill: Second Annual Report,
W77-02555 5E

An Experimental High-Ash Paper Mill Sludge Landfill: First Annual Report,
W77-02556 5E

Organic Compounds in Pulp Mill Lagoon Discharge,
W77-02558 5A

Toxicity, Uptake and Survey Studies of Boron in the Marine Environment,
W77-02565 5C

New Biological Clarifier of the Wiesloch Paper Mill of Holfelder-Werke GMBH. Und Co. KG (Neue biologische Klaeranlage der Papierfabrik Wiesloch der Holfelder-Werke GmbH und Co. KG.),
W77-02566 5D

New Clarifier Installation for Albbruck Paper Mill (Neue Klaeranlage der Papierfabrik Albbruck),
W77-02567 5D

Environmental Protection in the Pulp and Paper Industry, Possibilities of Realization and Present State of Technology (Umweltschutz in der Zellstoff- und Papierindustrie, Moeglichkeiten der Realisierung und heutiger Stand der Technik),
W77-02568 5D

Modern Separation Processes for Eliminating Waste Water and Sludge Problems in Pulp and Paper Mills (Neuzeitliche Trennungsverfahren zur Beseitigung des Abwasser und Schlamm problemes in Zellstoff- und Papierfabriken),
W77-02569 5D

Treatment of Papermaking Effluent (Traitement d'effluents de papeteries),
W77-02570 5D

Fixed Biological Surfaces -- Wastewater Treatment: The Rotating Biological Contractor,
W77-02571 5D

Progress in Sublethal Effect Studies with Kraft Pulp Mill Effluent and Salmonids,
W77-02573 5C

Study of Dewatering of Cellulosic Sludge from the Viscose Fiber Industry (Issledovanie po obezvozhivaniyu tsellyuloznogo shlama predpriyatii viskoznogo volokna),
W77-02575 5D

PUMPING
Maps Showing Ground-Water Conditions in the Lower Big Chino Valley and Williamson Valley Areas, Yavapai and Coconino Counties, Arizona,
W77-02312 7C

PUMPING PLANTS
Construction of Goscote Sewage Pumping Station.
W77-02326 8C

The Design and Construction of a Screening and Pumping Station and an Outfall for the Disposal of Sewage from Brighton and Hove,
W77-02331 5D

PYRIDINES
The Barrier Role of Water Treatment Installations with Respect to Certain Heterocyclic Compounds, (In Russian),
W77-02240 5A

RADAR
Use of Radar Information in Determining Flash Flood Potential,
W77-02509 2E

RADIOISOTOPES
Water Quality Impacts of Uranium Mining and Milling Activities in the Grants Mineral Belt, New Mexico,
W77-02208 5C

RAILROADS
Sanitary-Hygienic Evaluation of the Recycled Water Supply on Railroads, (In Russian),
W77-02241 3F

RAIN GAGES
Precipitation on Intermountain Rangeland in the Western United States,
W77-02179 2A

RAINDROP BREAKUP
Evolution of Raindrop Spectra with Collision Induced Breakup,
W77-02489 2B

RAINDROPS
Evolution of Raindrop Spectra with Collision Induced Breakup,
W77-02489 2B

RAINFALL
Precipitation on Intermountain Rangeland in the Western United States,
W77-02179 2A

A Technique for Estimating Tropical Open-Ocean Rainfall from Satellite Observations,
W77-02484 2B

Silver Content of Precipitation from Seeded and Nonseeded Florida Cumuli,
W77-02485 2K

RAINFALL DISPOSITION
Precipitation on Intermountain Rangeland in the Western United States,
W77-02179 2B

RAINFALL INTENSITY
Synthetic Design Hyetograph and Rational Runoff Coefficient,
W77-02135 2E

RAINFALL-RUNOFF RELATIONSHIPS
An Analysis of the Effects of Parameter Uncertainty in Deterministic Hydrologic Models,
W77-02125 2A

RAMAN EFFECT
Optical Remote Sensing of Water Pollutants,
W77-02192 5A

RAMAN SPECTROSCOPY
Water-Borne Viruses: Their Characterization by Raman Spectroscopy,
W77-02183 5A

Laser Methods of Rapid Detection, Identification and Quantitation of Human Enteric Viruses in Sewage and Rivers,
W77-02184 5A

RANGE MANAGEMENT
Chaparral Management: Its Potential--Its Problems--Its Future,
W77-02111 3B

Applications of ERTS Products in Range and Water Management Problems, Sahelian Zone: Mali, Upper Volta and Niger,
W77-02167 4A

RANGES
Precipitation on Intermountain Rangeland in the Western United States,
W77-02179 2B

RARE EARTH ELEMENTS
Rare Earth Element Supply to the Ocean,
W77-02478 2L

RATIONAL RUNOFF COEFFICIENT
Synthetic Design Hyetograph and Rational Runoff Coefficient,
W77-02135 2E

RECESSION CURVES
Flow Recession in the Ephemeral Stream,
W77-02162 2E

RECLAIMED WATER
Preliminary Selection of Storm-Water Basins Suitable for Infiltration of Reclaimed Water in Nassau County, Long Island, New York,
W77-02322 5G

The Influence of the Raw Water Conditioning on the Working Data of a Reverse Osmosis Plant to Produce Ultra-Pure Water (Einfluss der Rohwasserkonditionierung auf Betriebdaten einer Umkehrosmose-Anlage zu Reinstwassererzeugung),
W77-02355 5D

RECLAMATION
Environmental Impacts of Land Application of Sludge,
W77-02391 5D

Current EPA Research Activities in Solid Waste Management,
W77-02396 5E

RECREATION
Methods for Determining Recreational, Environmental, and Economic Consequences of Alternative Development Programs for the Bear Lake Area,
W77-02082 6B

Swimming Participation and Water Quality in Tompkins County, New York,
W77-02185 5G

RECYCLING
Sanitary-Hygienic Evaluation of the Recycled Water Supply on Railroads, (In Russian),
W77-02241 3E

Clarification Plant,
W77-02337 5D

Solar Sewage Plant 75% Energy Self-Sufficient.
W77-02354 5D

Recovery and Reuse of Alum from water Filtration Plant Sludge by Ultrafiltration,
W77-02371 5D

Landfill Management with Leachate Recycle and Treatment: An Overview,
W77-02411 5D

Hyperfiltration for Renovation of Textile Finishing Plant Wastewater,
W77-02557 5D

Chlorides in the Kraft Recovery System. II. Process and Equipment Aspects on a Closed Bleached Kraft Mill,
W77-02560 5D

Effluent-Free Bleached Kraft Pulp Mill. VIII. Bleach Plant Renovation and Design,
W77-02562 5D

RED SEA
Influence of Mercury, Lead, Cadmium and Copper on Primary Production and Phytoplankton in Some Coastal Areas of the Mediterranean and Red Seas, (In Russian),
W77-02249 5C

RED TIDE
Multidisciplinary Application of LANDSAT-2 Data to Marine Environment in Central Japan,
W77-02498 2L

REFRACTORY INDEX
Bio-Refractory Index for Organics in Water,
W77-02520 5A

REGIONAL DEVELOPMENT
Mathematical Models for Use in Planning Regional Water Resources and Energy Systems,
W77-02079 6A

REGULATION
Atlantic Offshore Oil: The Need for Planning and Regulation,
W77-02426 6G

A Bioeconomic Simulation Analysis of Regulating Groundwater Irrigation,
W77-02549 3F

REMOTE SENSING
The Use of LANDSAT DCS and Imagery in Reservoir Management and Operation,
W77-02151 4A

Applications of ERTS Products in Range and Water Management Problems, Sahelian Zone: Mali, Upper Volta and Niger,
W77-02167 4A

Optical Remote Sensing of Water Pollutants,
W77-02192 5A

Spectral Characteristics of the Microwave Emission from a Wind-Driven Foam-Covered Sea,
W77-02476 2L

Remote Sensing of Soil Moisture by a 21-CM Passive Radiometer,
W77-02480 2G

A Technique for Estimating Tropical Open-Ocean Rainfall from Satellite Observations,
W77-02484 2B

Monitoring Water Quality From LANDSAT.
W77-02494 5A

Satellite Microwave Observations of Soil Moisture Variations,
W77-02495 2G

An Operational Application of Satellite Snow Cover Observations - Northwest United States,
W77-02496 2C

Remote Sensing of Effects of Land-Use Practices on Water Quality,
W77-02497 5A

Multidisciplinary Application of LANDSAT-2 Data to Marine Environment in Central Japan,
W77-02498 2L

Skylab Imagery: Application to Reservoir Management in New England,
W77-02499 4A

Use of the LANDSAT-2 Data Collection System in the Colorado River Basin Weather Modification Program,
W77-02500 2B

Evaluation of the Feasibility of Using the Data Collection System to Operate a Network of Hydrological and Climato-Logical Stations at Sites Remote from Normal Communication Links,
W77-02501 7B

Use of LANDSAT Data for Natural Resources Investigation in the Lower Basin of Danube and Danube Delta,
W77-02503 2L

REPAIRING
Plastic Lining Overcomes Rugged Terrain,
W77-02333 8G

Emergency Repair of a Deep Storm Sewer Line,
W77-02350 8G

RESEARCH AND DEVELOPMENT
Water Resource Problems and Research Needs of North Carolina,
W77-02181 9D

Status of Ground-Water Modeling in the U.S. Geological Survey,
W77-02300 2F

RESEARCH PRIORITIES
Problem Identification and Ranking, A Selected Review of Techniques Used by Public Agencies,
W77-02080 6B

U. OF I. URBANA-CHAMPAIGN

RESEARCH PRIORITIES

Water Resource Problems and Research Needs of North Carolina,
W77-02181 9D

Current EPA Research Activities in Solid Waste Management,
W77-02396 5E

Current Office of Solid Waste Management Programs - Landfill Activities,
W77-02397 5E

Current Solid Waste Research Activities in New York State,
W77-02398 5E

Current Solid Waste Management Activities in Puerto Rico,
W77-02399 5E

Landfill Research Work in Progress at Harwells Hazardous Materials Service,
W77-02400 5E

RESERVOIR OPERATION

Operation of a Reservoir Collecting Water from a Small Watershed,
W77-02126 4A

The Use of LANDSAT DCS and Imagery in Reservoir Management and Operation,
W77-02151 4A

Skylab Imagery: Application to Reservoir Management in New England,
W77-02499 4A

RESERVOIR RELEASES

Selection of Streamflow and Reservoir-Release Models for River-Qualtiy Assessment,
W77-02302 2A

RESERVOIRS

Predicted and Observed Temperature and Water-Quality Changes of Lakes and Reservoirs,
W77-02304 2H

Monitoring Water Quality From LANDSAT.
W77-02494 5A

SKYLAB Study of Water Quality,
W77-02505 5A

RESISTIVITY

Detection of Subsurface Solution Cavities in Florida Using Electrical Resistivity Measurements,
W77-02517 2F

RESOURCE ALLOCATION

Old Answers to 'New' Problems: Henry George, Property Rights and Environmental Quality,
W77-02539 6B

RESOURCES DEVELOPMENT

Watershed Management's Effects on many Resources,
W77-02109 3B

RESPIRATION

A New Technique for Remote Monitoring of Activity of Freshwater Invertebrates with Special Reference Oxygen Consumption by Niaids of Anax Sp. and Somatochlora Sp. (Odonata),
W77-02216 5C

RETURN FLOW

A Comparison of Nitrogen, Phosphorus, and Carbon in Sediments and Soils of Cultivated and Noncultivated Watersheds in the North Central States,
W77-02292 5G

REVERSE OSMOSIS

The Influence of the Raw Water Conditioning on the Working Data of a Reverse Osmosis Plant to Produce Ultra-Pure Water (Einfluss der Rohwasserkonditionierung auf Betriebsdaten einer Umkehrosmose-Anlage zu Reinstwassererzeugung),
W77-02355 5D

Modern Separation Processes for Eliminating Waste Water and Sludge Problems in Pulp and Paper Mills (Neuzeitliche Trennungsverfahren zur Beseitigung des Abwasser und Schlammproblemes in Zellstoff- und Papierfabriken),
W77-02569 5D

REVIEWS

The Bearing Capacity of Floating Ice Plates Subjected to Static or Quasi-Static Loads,
W77-02460 2C

RING OVEN TECHNIQUE

Evaluation of the Ring Oven Technique for Water Monitoring,
W77-02148 5A

RIO GRANDE RIVER

Water Fowl Refuge Effect on Water Quality: I. Bacterial Populations,
W77-02513 5C

RISKS

Risk-Safety Factor Relation for Storm Sewer Design,
W77-02551 5D

RIVERS

Maine Rivers Bibliography- A User's Manual,
W77-02224 10C

Project Development and Data Programs for Assessing the Quality of the Willamette River, Oregon,
W77-02301 2E

Rare Earth Element Supply to the Ocean,
W77-02478 2L

Use of LANDSAT Data for Natural Resources Investigation in the Lower Basin of Danube and Danube Delta,
W77-02503 2L

ROMANIA

Use of LANDSAT Data for Natural Resources Investigation in the Lower Basin of Danube and Danube Delta,
W77-02503 2L

ROOT DISTRIBUTION

Maximizing Stomatal Control and Root System to Optimize Water-Use Efficiency in Soybeans,
W77-02077 3F

ROOT SYSTEMS

Maximizing Stomatal Control and Root System to Optimize Water-Use Efficiency in Soybeans,
W77-02077 3F

ROOT ZONE

Simulation of Root-Zone Water and Deep Seepage to a Water Table,
W77-02295 2G

ROSS ICE SHELF

A Note on the Contribution of Rime and Surface Hoar to the Accumulation on the Ross Ice Shelf, Antarctica,
W77-02469 2C

ROTATING BIOLOGICAL CONTACTOR

Fixed Biological Surfaces -- Wastewater Treatment: The Rotating Biological Contractor,
W77-02571 5D

ROTORS

Sewage Surface Aerator - Without Axial Thrust Thus Reducing Vibration from Waves.
W77-02342 5D

RUBBER PROCESSING INDUSTRY

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Fabricated and Reclaimed Rubber Segment of the Rubber Processing Point Source Category,
W77-02415 5D

RUNOFF

Maryland Highway Drainage Study: Volume I - Summary Report,
W77-02490 4C

Maryland Highway Drainage Study: Volume II - A Comparison of Maryland Highway Drainage Practices With Those of Other Agencies,
W77-02491 4C

Skylab Imagery: Application to Reservoir Management in New England,
W77-02499 4A

RUNOFF EFFICIENCY

Arizona's Frozen Assets: Snowpack Management,
W77-02106 2C

SACCHARIDES

Chemical Composition of Blue-Green Algae in the Kremenchug Reservoir, (In Russian),
W77-02254 5C

SAFETY

System for Evaluation of the Hazards of Bulk Water Transportation of Industrial Chemicals,
W77-02206 5C

SAFETY FACTORS

Risk-Safety Factor Relation for Storm Sewer Design,
W77-02551 5D

SAHEL

Applications of ERTS Products in Range and Water Management Problems, Sahelian Zone Mali, Upper Volta and Niger,
W77-02167 4A

SALINE BRANCH WATERSHED (ILL)

An Ecosystem Analysis of Environmental Contamination by Lead,
W77-02211 5A

SALINE LAKES

Vegetation and Soil of Saline Depressions Near Najaf, Central Iraq,
W77-02116 3C

SALINE SOILS

Sodium Relations in Desert Plants: 5. Cation Balance When Grown in Solution Culture and in the Field in Three Species of Lycium from the Northern Mojave Desert,
W77-02178 3C

SALINE WATER

Salt Water Domestic Waste Treatment,
W77-02353 5D

The Influence of the Raw Water Conditioning on the Working Data of a Reverse Osmosis

Plant to Produce Ultra-Pure Water (Einfluss der Rohwasserkonditionierung auf Betriebsdaten einer Umkehrosmose-Anlage zu Reinstwassererzeugung),
W77-02355 5D

SALINE WATER-FRESHWATER INTERFACES
Reactions of White Sea Organisms to a Decrease of Salinity in Connection with Freshwater Discharge into Bays, (In Russian),
W77-02233 2L

Potential for Development of Ground Water at a Test Site Near Truro, Massachusetts,
W77-02306 4B

SALINITY
A Mixed-Dimension Kinematic Estuarine Model,
W77-02131 2L

Distribution of Salinity and Temperature in the Hudson Estuary,
W77-02141 2L

Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

Reactions of White Sea Organisms to a Decrease of Salinity in Connection with Freshwater Discharge into Bays, (In Russian),
W77-02233 2L

Effect of Salinization on Hydromacrophytes of the Kuban Estuaries, (In Russian),
W77-02255 2L

SALMONIDS
Progress in Sublethal Effect Studies with Kraft Pulp Mill Effluent and Salmonids,
W77-02573 5C

SALT RIVER PROJECT
Arizona's Frozen Assets: Volumetric Forecasts from Snowpack,
W77-02108 2C

SALT RIVER VALLEY (ARIZONA)
Arizona's Frozen Assets: Volumetric Forecasts from Snowpack,
W77-02108 2C

SALTS
The Effect of Water with Different Mineralization Levels on the Animal Body, (In Russian),
W77-02270 5C

SAMPLING
Revised Department of the Army Pesticide Monitoring Program, I April, 1975,
W77-02203 5A

State Consideration of the Rivers Zeta and Moraca Based on the Chemical Control, (In Serbo-Croatiau),
W77-02266 5G

Analytical Methodologies for Leachate and Gas Analysis,
W77-02402 5A

Monitoring Toxic Chemicals in Land Disposal Sites,
W77-02409 5A

Nonpoint-Source Pollution in Surface Waters: Associated Problems and Investigative Techniques.
W77-02444 5B

SAN JUAN MOUNTAINS (COLO)
Ecological Impacts of Snowpack Augmentation in the San Juan Mountains of Colorado.
W77-02160 3B

SAND TRANSPORT
An Effect of Permeability on Sand Transport by Waves,
W77-02508 2L

SANDS
Movement of Fertilizer and Herbicide Through Irrigated Sands,
W77-02219 5B

An Effect of Permeability on Sand Transport by Waves,
W77-02508 2L

Drainage of Vertical Columns of Lakeland Sand,
W77-02510 2G

SARGASSO SEA
Tracking a Gulf Stream Ring With SOFAR Floats,
W77-02139 2L

SATELLITES (ARTIFICIAL)
Applications of ERTS Products in Range and Water Management Problems, Sahelian Zone: Mali, Upper Volta and Niger,
W77-02167 4A

An Operational Application of Satellite Snow Cover Observations - Northwest United States,
W77-02496 2C

Retransmission of Hydrometric Data in Canada,
W77-02506 7C

SATURATED SOILS
A Model for the Simultaneous Production and Diffusion of Ferrous Iron in Submerged Soils,
W77-02278 2G

SAVANNAH RIVER (GEO-SC)
Sediment Problems in the Savannah River Basin,
W77-02320 2J

SCHEDULING
Irrigation Scheduling for Energy and Water Conservation,
W77-02093 3F

SCHISTOSOMA
The Role of Silt in Eradication of Oncomelaniid Snails in Grassy Beaches, (In Chinese).
W77-02245 5G

SCHMIDT NUMBERS
Turbulent Transport to a Rotation Cylinder for Large Prandtl or Schmidt Numbers,
W77-02534 3A

SCOTLAND
Climatic Inferences from Former Glaciers in the South-East Grampian Highlands, Scotland,
W77-02467 2C

SCOUR
Scouring of Cohesive Soils,
W77-02127 2J

SCREENS
The Design and Construction of a Screening and Pumping Station and an Outfall for the Disposal of Sewage from Brighton and Hove,
W77-02331 5E

SEA ICE
Ice Movement and Distribution in the Bering Sea from March to June 1974,
W77-02482 2C

SEA LEVEL
The Effect of the Geostrophic Flow Upon Coastal Sea Elevations in the Northern North Pacific Ocean,
W77-02477 2L

SEABED MINING
International Seabed Regime: India's Interests and Policy Options,
W77-02424 6E

SEAFOOD PROCESSING INDUSTRY
Economic Analysis of Effluent Guidelines for Seafood Processing Industry: (Fish Meal, Salmon, Bottom Fish, Clams, Oysters, Sardines, Scallops, Herring, Abalone),
W77-02433 5D

SEDIMENT THICKNESSES
Sedimentation Rates and Sediment Thicknesses in Lake Champlain: 1975-76,
W77-02193 2J

SEDIMENT TRANSPORT
Sediment Problems in the Savannah River Basin,
W77-02320 2J

SEDIMENTATION
Controlling Erosion and Sedimentation at Construction Sites,
W77-02146 4D

Sediment Problems in the Savannah River Basin,
W77-02320 2J

Suspended Sludge Scraper for Arcuate Sedimentation Zone,
W77-02335 5D

SEDIMENTATION RATES
Sedimentation Rates and Sediment Thicknesses in Lake Champlain: 1975-76,
W77-02193 2J

SEDIMENTOLOGY
Sedimentology and Paleoecology of Middle and Upper Eocene Carbonate Shoreline Sequences, Crystal River, Florida, U.S.A.,
W77-02545 2F

SEDIMENTS
A Submodel for Nitrogen Release from Sediments,
W77-02099 5B

Distribution of Calcium Carbonate in Surface Sediments of the Atlantic Ocean,
W77-02133 2L

Distribution of Carbonate in Surface Sediments of the Pacific Ocean,
W77-02134 2L

Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

Rare Earth Element Supply to the Ocean,
W77-02478 2L

Use of LANDSAT Data for Natural Resources Investigation in the Lower Basin of Danube and Danube Delta,
W77-02503 2L

U. OF I. URBANA-CHAMPAIGN

SEEPAGE
Analysis of Storm Water Seepage Basins in Peninsular Florida,
W77-02083 5G

Seepage from Trapezoidal Canal in Anisotropic Soil,
W77-02137 2G

Transient Movement of Water and Solutes in Unsaturated Soil Systems, Phase II,
W77-02189 2G

Simulation of Root-Zone Water and Deep Seepage to a Water Table,
W77-02295 2G

SEEPAGE CONTROL
Sanitary-Hygienic Aspects of the Use of New Preparations for Controlling Seepage in Water Bodies, (In Russian),
W77-02269 4A

SEISMIC PROPERTIES
Automated Seismic Monitoring System for Lake Michigan Ice Studies,
W77-02468 2C

SELENASTRUM
A Sensitive Algal Assay: An Improved Method for Analysis of Freshwaters,
W77-02524 5A

SELENITE
The Effect of Selenite on the Physiological and Morphological Properties of the Blue-Green Alga Phormidium Luridum Var. Olivacea,
W77-02546 5C

SELENIUM
Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

Water Quality Impacts of Uranium Mining and Milling Activities in the Grants Mineral Belt, New Mexico,
W77-02208 5G

SELF PURIFICATION
Hygienic Aspects of a Study of Bdellovibrio Bacteriovorus as a Natural Factor of Self-Purification of Water Bodies, (In Russian),
W77-02243 5C

SENSITIVE ASSAY
A Sensitive Algal Assay: An Improved Method for Analysis of Freshwaters,
W77-02524 5A

SENSITIVITY ANALYSIS
Sensitivity and Model Variance Analysis Applied to Some Evaporation and Evaportranspiration Models,
W77-02298 2D

SEPARATION TECHNIQUES
Suspended Sludge Scraper for Arcuate Sedimentation Zone,
W77-02335 5D

Waste Water Processing with HGMS (High Gradient Magnetic Separators),
W77-02348 5D

The Use of Tenax for the Extraction of Pesticides and Polychlorinated Biphenyls from Water. II. Tests with Artificially Polluted and Natural Waters,
W77-02561 5G

SEPTIC TANKS
Septic Tank Effluent Movement Through Soil,
W77-02087 5B

Denitrification of Nitrified Septic Tank Effluent,
W77-02347 5D

SEWAGE
Eagle Lake Pollution Control Project, Eagle Lake Kandiyohi County, Minnesota, Bench Mark Studies,
W77-02215 5G

Estuarine Pollution Control: Objectives and Priorities,
W77-02343 5G

SEWAGE DISPOSAL
Water Supply and Sewage Treatment in Arid Areas.
W77-02173 5D

The Design and Construction of a Screening and Pumping Station and an Outfall for the Disposal of Sewage from Brighton and Hove,
W77-02331 5E

Movement of Heavy Metals Below Sewage Disposal Ponds,
W77-02379 5B

SEWAGE EFFLUENTS
Changes in Benthos and Fishes of a Stream Accompanying a Substantial Reduction in Plant Nutrients,
W77-02191 5C

SEWAGE LIME SLUDGE
Development of Design and Operating Criteria for Handling Advanced Waste Treatment Plant Sludge,
W77-02188 5D

SEWAGE SLUDGE
Development of Design and Operating Criteria for Handling Advanced Waste Treatment Plant Sludge,
W77-02188 5D

Combined Filter and Dryer for Sewage Sludge Etc. - Uses Band of Vacuum Filter to Carry Cake Through Filter Press.
W77-02341 5D

Soybean Yield Responses and Assimilation of ZN and CD from Sewage Sludge-Amended Soil,
W77-02377 5C

Ocean Dumping Phase-Out in EPA Region II,
W77-02393 5E

SEWAGE TREATMENT
Water Supply and Sewage Treatment in Arid Areas.
W77-02173 5D

Tanks of Panel Construction.
W77-02325 8A

Construction of Goscote Sewage Pumping Station,
W77-02326 8C

Clarification Plant,
W77-02337 5D

Fluid Sampler and Oxygen Meter for Sewage Processing - Biological Oxygen Demand Detailed Continuously by Reaction Vessel Read-Out.
W77-02340 5A

Sewage Surface Aerator - Without Axial Thrust Thus Reducing Vibration from Waves.
W77-02342 5D

Open Tank Pure Oxygen System Begins Operation,
W77-02359 5D

Packaged Plant for Virgin Islands.
W77-02360 8G

Wastewater Plant Does Nicely Without Natural Gas, Thank You,
W77-02363 5D

Sandwich Construction G.R.P.
W77-02368 8G

A Discourse on the Biochemical Oxidation of Sewage,
W77-02373 5D

Environmental Trust Funds: An Evaluation,
W77-02432 5G

SEWERS
The Design and Test of a Safe and Effective Storm-Sewer Inlet,
W77-02186 8B

Austin's 11 Mile Sewer Tunnel Reflects Sound, Economic, Environmental Alternatives,
W77-02327 5D

Thurrock Beats Peat with Piled Pipes,
W77-02328 8E

Test New Sewers with Low-Pressure Air.
W77-02329 8G

Precast Segments Speed Installation of Thunder Bay Sewer,
W77-02330 8F

Plastic Lining Overcomes Rugged Terrain,
W77-02333 8G

Emergency Repair of a Deep Storm Sewer Line,
W77-02350 8G

Risk-Safety Factor Relation for Storm Sewer Design,
W77-02551 5D

SHEAR STRESS
Oblique Impingement of Plane Turbulent Jets,
W77-02464 8B

SHELLFISH
The Aquaculture of Fresh Water Prawns, Macrobrachium Species,
W77-02209 3F

SHORE PROTECTION
Salt Marsh Establishment and Development,
W77-02420 4D

SHORES
Notes on Tidal Inlets on Sandy Shores,
W77-02504 2L

SILICA
Exchange of Nutrients and Trace Metals Between Marsh Sediments and Estuarine Waters - A Field Study,
W77-02217 5B

SILTS
The Role of Silt in Eradication of Oncomelaniid Snails in Grassy Beaches, (In Chinese).
W77-02245 5G

SILVER
Silver Content of Precipitation from Seeded and Nonseeded Florida Cumuli,
W77-02485 2K

SILVER IODIDE
Silver Content of Precipitation from Seeded and Nonseeded Florida Cumuli,
W77-02485 2K

SIMULATION ANALYSIS
An Analysis of the Effects of Parameter Uncertainty in Deterministic Hydrologic Models,
W77-02125 2A

Water Pollution Investigation: Duluth-Superior Area,
W77-02202 5B

Assessing Synthetic and Admixed Materials for Lining Landfills,
W77-02410 5E

Mathematical Modeling of Phytoplankton in Lake Ontario. Part 2. Simulations Using Lake 1 Model,
W77-02443 5C

A Bioeconomic Simulation Analysis of Regulating Groundwater Irrigation,
W77-02549 3F

SITE DEVELOPMENT LAGOONS
Evaluation of Estuarine Site Development Lagoons,
W77-02088 5G

SKYLAB
Remote Sensing of Soil Moisture by a 21-CM Passive Radiometer,
W77-02480 2G

Skylab Imagery: Application to Reservoir Management in New England,
W77-02499 4A

SKYLAB Study of Water Quality,
W77-02505 5A

SLUDGE
Suspended Sludge Scraper for Arcuate Sedimentation Zone,
W77-02335 5D

Pilot Plant Travels on Wheels.
W77-02366 5D

Crop Response to Tank Truck Application of Liquid Sludge,
W77-02390 5C

Solid Waste Degradation Due to Shredding and Sludge Addition,
W77-02412 5E

SLUDGE DISPOSAL
Movement of Heavy Metals Below Sewage Disposal Ponds,
W77-02379 5B

Crop Response to Tank Truck Application of Liquid Sludge,
W77-02390 5C

Environmental Impacts of Land Application of Sludge,
W77-02391 5D

Ocean Dumping Phase-Out in EPA Region II,
W77-02393 5E

An Experimental High-Ash Paper Mill Sludge Landfill: Second Annual Report,
W77-02555 5E

An Experimental High-Ash Paper Mill Sludge Landfill: First Annual Report,
W77-02556 5E

C(rown) Z(ellerbach)'s Solids Waste Problems at Wauna are Reduced by Composting,
W77-02572 5E

Study of Dewatering of Cellulosic Sludge from the Viscose Fiber Industry (Issledovanie po obezvozhivaniyu tsellyuloznogo shlama predpriyatii viskoznogo volokna),
W77-02575 5D

SLUDGE QUALITY INDEX
Toward a More Meaningful Index of Sludge Quality,
W77-02378 5G

SLUDGE TREATMENT
Development of Design and Operating Criteria for Handling Advanced Waste Treatment Plant Sludge,
W77-02188 5D

Combined Filter and Dryer for Sewage Sludge Etc. - Uses Band of Vacuum Filter to Carry Cake Through Filter Press.
W77-02341 5D

Feasibility of High-Energy Electron Treatment of Municipal Sludge,

Recovery and Reuse of Alum from water Filtration Plant Sludge by Ultrafiltration,
W77-02371 5D

Aspects of Sludge Treatment,
W77-02372 5D

Modern Separation Processes for Eliminating Waste Water and Sludge Problems in Pulp and Paper Mills (Neuzeitliche Trennungsverfahren zur Beseitigung des Abwasser und Schlammproblemes in Zellstoff- und Papierfabriken),
W77-02569 5D

SMALL WATERSHEDS
Operation of a Reservoir Collecting Water from a Small Watershed,
W77-02126 4A

SMITTIUM CULISETAE
Lipids of Smittium Culisetae,
W77-02547 5A

SNAILS
The Role of Silt in Eradication of Oncomelaniid Snails in Grassy Beaches, (In Chinese).
W77-02245 5G

SNOW
Kaiser Effect in Snow,
W77-02154 2C

Snow Pressure on Rigid Obstacles,
W77-02463 2C

SNOW COVER
An Operational Application of Satellite Snow Cover Observations - Northwest United States,
W77-02496 2C

SNOW MANAGEMENT
Arizona's Frozen Assets: Snowpack Management,
W77-02106 2C

Arizona's Frozen Assets: Volumetric Forecasts from Snowpack,
W77-02108 2C

SNOWPACKS
Arizona's Frozen Assets: Snowpack Management,
W77-02106 2C

Arizona's Frozen Assets: Volumetric Forecasts from Snowpack,
W77-02108 2C

Ecological Impacts of Snowpack Augmentation in the San Juan Mountains of Colorado.
W77-02160 3B

Measurements of Acoustic Properties of Hard-Pack Snow,
W77-02462 2C

SODIUM ALUMINATE
Studies on Lake Restoration by Phosphorus Inactivation,
W77-02442 5G

SODIUM COMPOUNDS
Studies on Lake Restoration by Phosphorus Inactivation,
W77-02442 5G

SOIL AMENDMENTS
Soybean Yield Responses and Assimilation of ZN and CD from Sewage Sludge-Amended Soil,
W77-02377 5C

Crop Response to Tank Truck Application of Liquid Sludge,
W77-02390 5C

Environmental Impacts of Land Application of Sludge,
W77-02391 5D

SOIL ANALYSIS
The Use of A Specific Ion Electrode for Determination of Bromide in Soils,
W77-02100 2G

Trace Elements in Soils of the Dnieper-Bug Liman, (In Ukranian),
W77-02258 2G

Extraction-Photometric Determination of Mercury in Soil and Water, (In Russian),
W77-02272 5A

Movement of Heavy Metals Below Sewage Disposal Ponds,
W77-02379 5B

SOIL CHEMICAL PROPERTIES
The Effect of Ammonia and Ammonia-Sulfur Solutions on Nitrification Rates and Chemical Properties of a Calcareous Soil,
W77-02276 2G

SOIL CHEMISTRY
The Use of A Specific Ion Electrode for Determination of Bromide in Soils,
W77-02100 2G

The Effect of Ammonia and Ammonia-Sulfur Solutions on Nitrification Rates and Chemical Properties of a Calcareous Soil,
W77-02276 2G

SOIL COLUMNS
Fixation of Iron and Zinc Applied as Chelates into a Soil Column During Leaching,
W77-02280 2G

U. OF I. URBANA-LIBRARY

SOIL EROSION
Influence of Tall Wheatgrass Wind Barriers on Soil Drying,
W77-02168 4D

Sediment Problems in the Savannah River Basin,
W77-02320 2J

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Formulated Fertilizer Segment of the Fertilizer Manufacturing, Point Source Category,
W77-02419 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Primary Aluminum Smelting Subcategory of the Aluminum Segment of the Nonferrous Metals Manufacturing, Point Source Category,
W77-02421 5D

Economic Analysis of Effluent Guidelines: The Textiles, Friction and Sealing Materials Segment of the Asbestos Manufacturing Industry,
W77-02422 5G

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Phosphorus Derived Chemicals Segment of the Phosphate Manufacturing Point Source Category,
W77-02431 5G

Economic Analysis of Effluent Guidelines for Seafood Processing Industry: (Fish Meal, Salmon, Bottom Fish, Clams, Oysters, Sardines, Scallops, Herring, Abalone),
W77-02433 5D

Economic Analysis of Effluent Guidelines: Beet Sugar Industry,
W77-02434 5D

STATE GOVERNMENTS
Minnesota Water Resources Board and Watershed Districts.
W77-02428 6E

STATE MONITORING AGENCIES
Compilation of State Data for Eight Selected Toxic Substances, Vol. 1, Final Report,
W77-02204 5G

STATISTICS
National Environmental Statistical Report,
W77-02447 7C

STEADY FLOW
Simulated Effects of the Proposed Tennessee Colony Reservoir on Ground-Water Conditions in the Carrizo-Wilcox Aquifer and Trinity River Alluvium, Texas,
W77-02305 4A

Transverse Mixing in Natural Channels,
W77-02313 2E

STEEL STRUCTURES
Glass Coated Steel Tanks.
W77-02361 8G

STOCHASTIC PROCESSES
A Bioeconomic Simulation Analysis of Regulating Groundwater Irrigation,
W77-02549 3F

STOMATA
Maximizing Stomatal Control and Root System to Optimize Water-Use Efficiency in Soybeans,
W77-02077 3F

Patterns of Leaf Resistance to Lodgepole Pine Transpiration in Wyoming,
W77-02531 2D

STORAGE TANKS
Glass Coated Steel Tanks.
W77-02361 8G

STORM DRAINS
Characterization of Urban Runoff,
W77-02180 5B

The Design and Test of a Safe and Effective Storm-Sewer Inlet,
W77-02186 8B

Risk-Safety Factor Relation for Storm Sewer Design,
W77-02551 5D

STORM RUNOFF
Preliminary Selection of Storm-Water Basins Suitable for Infiltration of Reclaimed Water in Nassau County, Long Island, New York,
W77-02322 5G

STORM SEWERS
Risk-Safety Factor Relation for Storm Sewer Design,
W77-02551 5D

STORM WATER
Analysis of Storm Water Seepage Basins in Peninsular Florida,
W77-02083 5G

Emergency Repair of a Deep Storm Sewer Line,
W77-02350 8G

STRATIFIED ESTUARIES
Evaluation of Circulation in Estuaries,
W77-02456 2L

STRATIGRAPHY
Stratigraphy of the Paleocene and Lower Part of the Eocene in Western Tennessee,
W77-02315 2F

STREAMFLOW
Flow Recession in the Ephemeral Stream,
W77-02162 2E

Selection of Streamflow and Reservoir-Release Models for River-Qualtiy Assessment,
W77-02302 2A

Surface Water Supply of the United States, 1966-70: Part 1. North Atlantic Slope Basins--Volume 3. Basins from Maryland to York River.
W77-02307 7C

Sediment Problems in the Savannah River Basin,
W77-02320 2J

STREAMFLOW FORECASTING
Comparison of Linear Systems and Finite Difference Flow-Routing Techniques,
W77-02319 2E

STREAMS
Maine Rivers Bibliography- A User's Manual,
W77-02224 10C

The Distribution of Two Mosquito-Larvivorous Fishes, Gambusia Affinis and Oryzias Latipes, in the Tokyo Metropolitan Area, (In Japanese),
W77-02297 5G

STRENGTH OF MATERIALS
The Bearing Capacity of Floating Ice Plates Subjected to Static or Quasi-Static Loads,
W77-02460 2C

STRESS
Kaiser Effect in Snow,
W77-02154 2C

STRIP MINES
Strip-Mining Techniques to Minimize Environmental Damage in the Upper Missouri River Basin States,
W77-02445 5G

STRUCTURAL DESIGN
Construction of Goscote Sewage Pumping Station,
W77-02326 8C

SUBARCTIC
The Effect of the Geostrophic Flow Upon Coastal Sea Elevations in the Northern North Pacific Ocean,
W77-02477 2L

SUBLETHAL EFFECTS
Progress in Sublethal Effect Studies with Kraft Pulp Mill Effluent and Salmonids,
W77-02573 5C

SUBMARINE CANYONS
The Barrow Submarine Canyon: A Drain for the Chukchi Sea,
W77-02481 2L

SUBSOILS
Nitrogen Fixation by Algae in Fescuegrass Soil Crusts,
W77-02274 2G

SUBSURFACE DRAINAGE
Maryland Highway Drainage Study: Volume VI - An Experimental Examination of the Subsurface Drainage of Roadways,
W77-02493 4C

SUBSURFACE MAPPING
Geophysical Study of the Waterbearing Strata in Bitterroot Valley, Montana,
W77-02085 2F

SUBURBAN AREAS
Physical and Economic Effects on the Local Agricultural Economy of Water Transfer to Cities,
W77-02190 6B

SUCCESSION
Algal Metabolite Influence on Bloom Sequence in Eutrophied Freshwater Ponds,
W77-02438 5C

SUDAN
Experts Cling to Water Myths,
W77-02120 3F

SUGAR CANE
Economic Analysis of Effluent Guidelines: Cane Sugar Refining,
W77-02414 5D

SUGAR REFINERY WASTES
The Effect of Bottom Sediments on Formation of Surface Water Composition, (In Russian),
W77-02259 5B

SULFUR
Sulfur Fractions and Carbon-Nitrogen-Phosphorus-Sulfur Relationships in Some Brazilian and Iowa Soils,
W77-02102 2G

SURFACE EQUILIBRIA
Determination of Surface Equilibria and Mass Transfer Rates in a Concurrent Flow Bubble Column,
W77-02535 3A

SURFACE-GROUNDWATER RELATIONSHIPS
Effects of Water-Management Practices on the Flow of the South Platte River, Colorado,
W77-02303 4B

Effects of Water Management on Fresh-Water Discharge to Biscayne Bay,
W77-02314 4A

SURFACE IRRIGATION
He's Automating Dead Level Irrigation,
W77-02198 3F

Making Surface Irrigation Work with Automation,
W77-02199 3F

Herbicides and Surface Irrigation-Do They Make A Team,
W77-02200 3F

SURFACE RUNOFF
Arizona's Frozen Assets: Snowpack Management,
W77-02106 2C

SURFACE WATERS
Surface Water Supply of the United States, 1966-70: Part 1. North Atlantic Slope Basins--Volume 3. Basins from Maryland to York River.
W77-02307 7C

Depth to Water Table, Recharge Areas, Drainage Basins, and Relief of Duval County, Florida,
W77-02311 7C

Hydrology of Lake County, Florida,
W77-02316 4B

SURVEYS
Surveying America's Lakes,
W77-02375 5C

SUSPENDED SOLIDS
Waste Water Processing with HGMS (High Gradient Magnetic Separators),
W77-02348 5D

Toward a More Meaningful Index of Sludge Quality,
W77-02378 5G

Instantaneous Metering Aids - Activated Sludge Plant,
W77-02381 5A

Rare Earth Element Supply to the Ocean,
W77-02478 2L

SKYLAB Study of Water Quality,
W77-02505 5A

SUWANNEE RIVER BASIN (FLA)
Water Resources Information Needs for the Suwannee River Water Management District,
W77-02318 4A

SWAMPS
The Distribution of Two Mosquito-Larvivorous Fishes, Gambusia Affinis and Oryzias Latipes, in the Tokyo Metropolitan Area, (In Japanese),
W77-02297 5G

SWEDEN
Some Aspects of Municipal Overflow Reservoir Monitoring, (In Swedish),
W77-02228 5A

SWIMMING
Swimming of Slender Fish in a Non-Uniform Velocity Field,
W77-02155 2L

Swimming Participation and Water Quality in Tompkins County, New York,
W77-02185 5G

SYNTHETIC HYETOGRAPH
Synthetic Design Hyetograph and Rational Runoff Coefficient,
W77-02135 2E

SYSLAB PROGRAMS
A Bivariate-Regression Model for Estimating Chemical Composition of Streamflow or Groundwater,
W77-02317 5B

SYSTEMS ANALYSIS
Mathematical Models for Use in Planning Regional Water Resources and Energy Systems,
W77-02079 6A

A Comprehensive Systems Engineering Study of the True Economic Value of Unpolluted Water Versus Varying Degrees of Polluted Water,
W77-02220 5G

TASHKENT OBLAST
Trace Elements in the Environment of Some Goiter Regions of the Tashkent Oblast, (In Russian),
W77-02388 5G

TASTE
Occurrence of Kerosene-Like Hydrocarbons in the Bream, Mylio Australis Gunther,
W77-02212 5C

TECHNOLOGY
Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Fabricated and Reclaimed Rubber Segment of the Rubber Processing Point Source Category,
W77-02415 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Primary Aluminum Smelting Subcategory of the Aluminum Segment of the Nonferrous Metals Manufacturing, Point Source Category,
W77-02421 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Phosphorus Derived Chemicals Segment of the Phosphate Manufacturing Point Source Category,
W77-02431 5G

TEMERNIK RIVER (USSR)
Effect of River Pollution on Aquatic Beetles, (In Russian),
W77-02261 5A

TEMPERATE
Elements of Limnological Specificity of Large Lakes in the Temperate Zone, (In Russian),
W77-02260 2H

TEMPERATURE
Distribution of Salinity and Temperature in the Hudson Estuary,
W77-02141 2L

Effect of Environmental Conditions on the Degradation of DDT in Model Marine Ecosystems,
W77-02213 5C

TEMPERATURE-SALINITY RELATIONSHIPS
Distribution of Salinity and Temperature in the Hudson Estuary,
W77-02141 2L

TENAX
The Use of Tenax for the Extraction of Pesticides and Polychlorinated Biphenyls from Water. II. Tests with Artificially Polluted and Natural Waters,
W77-02561 5G

TENCH
The Effect of Sub-Lethal Lead Concentrations on the Chemoreceptors of Two Fresh Water Fish Species, (In German),
W77-02383 5C

TENNESSEE
Identification and Quantification of Water Quality Change Inducting Mechanisms in Stratified Reservoirs,
W77-02089 5C

Stratigraphy of the Paleocene and Lower Part of the Eocene in Western Tennessee,
W77-02315 2F

TERTIARY TREATMENT
Coleshill Advanced Wastewater Treatment Project,
W77-02344 5D

Advanced Waste Treatment Plant has Physical-Chemical Option,
W77-02345 5D

Waste Water Processing with HGMS (High Gradient Magnetic Separators),
W77-02348 5D

Polymers Cut Cost of Phosphorus Removal,
W77-02374 5D

The Role of Solar Ultraviolet Radiation in 'Natural' Water Purification,
W77-02552 5D

TESTING PROCEDURES
Evaluation of the Ring Oven Technique for Water Monitoring,
W77-02148 5A

Evaluation of the Ring Oven Technique for Water Monitoring, Appendices,
W77-02149 5A

Test New Sewers with Low-Pressure Air,
W77-02329 8G

TETRAETHYL LEAD
An Ecosystem Analysis of Environmental Contamination by Lead,
W77-02211 5A

TEXAS
Simulated Effects of the Proposed Tennessee Colony Reservoir on Ground-Water Conditions in the Carrizo-Wilcox Aquifer and Trinity River Alluvium, Texas,
W77-02305 4A

TEXTILES
Hyperfiltration for Renovation of Textile Finishing Plant Wastewater,
W77-02557 5D

Carpet and Rug Industry Case Study I: Water and Wastewater Treatment Plant Operation,
W77-02574 5D

THEORETICAL ANALYSIS
On the Species Transport Equation for Flow in Porous Media,
W77-02452 2F

Partial Wave Damping in Pneumatic Breakwaters,
W77-02455 8B

THERMAL PLUMES
Thermal Plumes in the Kansas River,
W77-02187 5B

THERMAL POLLUTION
Water Use Implications for Nuclear Power Stations in the United States of America,
W77-02114 6G

Thermal Plumes in the Kansas River,
W77-02187 5B

Thermal Effects on Biodegradation of Pollutants in Water,
W77-02218 5B

Ways of Preventing Thermal Pollution of Water Bodies by Wastewaters of Nuclear Power Plants, (In Russian),
W77-02271 5G

Are the Chesapeake Bay Waters Warming Up,
W77-02472 2L

THERMAL PROPERTIES
Thermal Plumes in the Kansas River,
W77-02187 5B

THERMAL REGENERATION
Kinetics of the Activated Carbon-Steam Reaction,
W77-02519 5D

THERMODYNAMIC MODELS
A Thermodynamic Model for Predicting the Formation, Stability, and Weathering of Common Soil Minerals,
W77-02285 2G

THERMOPHILIC BACTERIA
Thermophillic Bio-Oxidation of High-Strength Organic Wastewaters and Sludges,
W77-02369 5D

THIN-LAYER CHROMATOGRAPHY
Lipids of Smittium Culisetae,
W77-02547 5A

TIDAL MARSHES
Biology of Blue-Green Algae of Tide Marshes,
W77-02446 5C

TIDAL STREAMS
Oxygen in a Tidal River: Low Tide Concentration Correlates Linearly with Location,
W77-02145 2L

TIDES
Notes on Tidal Inlets on Sandy Shores,
W77-02504 2L

TIME SERIES ANALYSIS
On the Reliability of the Spectral Method for the Design of Offshore Structures,
W77-02129 8B

TIMS FORD RESERVOIR (TENN)
Identification and Quantification of Water Quality Change Inducting Mechanisms in Stratified Reservoirs,
W77-02089 5C

TOLUENE
A Simple Apparatus for Metering Volatile Liquids into Water,
W77-02454 7B

TOMPKINS COUNTY (NY)
Swimming Participation and Water Quality in Tompkins County, New York,
W77-02185 5G

TOPMINNOW
The Distribution of Two Mosquito-Larvivorous Fishes, Gambusia Affinis and Oryzias Latipes, in the Tokyo Metropolitan Area, (In Japanese),
W77-02297 5G

TORULOPSIS
Distribution of Aquatic Yeasts - Effect of Incubation Temperature and Chloramphenicol Concentration on Isolation,
W77-02525 5A

TOXIC SUBSTANCES
Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

TOXICITY
A Bioassay to Assess Wastewater Toxicity to Aerobic Biological Treatment,
W77-02081 5D

Effects of Selected Chemicals on Movement, Growth and Survival of Certain Aquatic Animal Life,
W77-02084 5C

Fate and Effects of Oil Pollutants in Extremely Cold Marine Environments,
W77-02210 5C

Toxicological Characteristics of Acute Phenol Intoxication in Some Freshwater Worms, (In Russian),
W77-02237 5C

Studies on the Tolerance of the Guppy, Poecilia Reticulata (Peters), a Natural Enemy of Mosquito Larvae, to the Septic Pollution of Water, (In Japanese),
W77-02238 5C

Dynamics of the Content of Some Organic Toxic Substances in Planis Irrigated with Effluents of the Coal-Tar Chemical Industry, (In Russian),
W77-02263 5C

Toxicity, Uptake and Survey Studies of Boron in the Marine Environment,
W77-02565 5C

U. OF I. URBANA-LIBRARY

TRACE ELEMENTS
Trace Elements in Soils of the Dnieper-Bug Liman, (In Ukranian),
W77-02258 2G

Trace Elements in the Environment of Some Goiter Regions of the Tashkent Oblast, (In Russian),
W77-02388 5G

TRACE METALS
Exchange of Nutrients and Trace Metals Between Marsh Sediments and Estuarine Waters - A Field Study,
W77-02217 5B

TRACERS
The Use of A Specific Ion Electrode for Determination of Bromide in Soils,
W77-02100 2G

TRANSCARPATHIA (USSR)
Effectiveness of Continuous Chlorination of Well Water by Dosage Cartridges in Transcarpathia, (In Russian),
W77-02256 5F

TRANSITION ENERGIES
Configuration Interaction Studies of the Excited States of Water,
W77-02153 1A

TRANSPIRATION
Relative Importance of Soil Resistance and Plant Resistance in Root Water Absorption,
W77-02118 2D

Effect of Abscisic Acid at Different Levels of Soil Water Potential on the Transpiration of Zea Mays,
W77-02121 3B

Patterns of Leaf Resistance to Lodgepole Pine Transpiration in Wyoming,
W77-02531 2D

TRANSPORTATION
System for Evaluation of the Hazards of Bulk Water Transportation of Industrial Chemicals,
W77-02206 5G

TRANSVERSE MIXING
Transverse Mixing in Natural Channels,
W77-02313 2E

TRAPA-NATANS
Some Aspects of the Chemical Composition of Trapa Natans L. in Lake Maggiore (Italy), Especially Manganese and Iron, (In French),
W77-02250 5C

TREATMENT
On the Income Distributional Effects of Environmental Management Policies,
W77-02124 5G

TREATMENT FACILITIES
Water Supply and Sewage Treatment in Arid Areas.
W77-02173 5D

The Design and Construction of a Screening and Pumping Station and an Outfall for the Disposal of Sewage from Brighton and Hove,
W77-02331 5E

Flow Data Collection for Infiltration-Inflow Analysis,
W77-02334 5D

Coleshill Advanced Wastewater Treatment Project,
W77-02344 5D

Advanced Waste Treatment Plant has Physical-Chemical Option,
W77-02345 5D

Minneapolis-St. Paul: Land of the 'Shining Big-Sea-Waters',
W77-02351 5D

Solar Sewage Plant 75% Energy Self-Sufficient.
W77-02354 5D

Packaged Plant for Virgin Islands.
W77-02360 8G

Wastewater Plant Does Nicely Without Natural Gas, Thank You,
W77-02363 5D

Pilot Plant Travels on Wheels.
W77-02366 5D

Sandwich Construction G.R.P.
W77-02368 8G

Movement of Heavy Metals Below Sewage Disposal Ponds,
W77-02379 5B

Alarm System Continually Monitors Plant Functions,
W77-02382 8C

Environmental Trust Funds: An Evaluation,
W77-02432 5G

New Clarifier Installation for Albbruck Paper Mill (Neue Klaeranlage der Papierfabrik Albbruck).
W77-02567 5D

TRICKLE IRRIGATION
Drip Irrigation Filtration Problems and Research,
W77-02090 3F

Drip Irrigation Progress and Problems,
W77-02091 3F

Optimization of Water Use Efficiency Under High Frequency Irrigation--I. Evapotranspiration and Yield Relationship,
W77-02103 3F

TRINITY RIVER FLOOD PLAIN (TEX)
Simulated Effects of the Proposed Tennessee Colony Reservoir on Ground-Water Conditions in the Carrizo-Wilcox Aquifer and Trinity River Alluvium, Texas,
W77-02305 4A

TRITIUM
Transient Movement of Water and Solutes in Unsaturated Soil Systems, Phase II,
W77-02189 2G

TRURO (MASS)
Potential for Development of Ground Water at a Test Site Near Truro, Massachusetts,
W77-02306 4B

TRUST FUNDS
Environmental Trust Funds: An Evaluation,
W77-02432 5G

TSUNAMIS
On the Reliability of the Spectral Method for the Design of Offshore Structures,
W77-02129 8B

TUBIFICIDS
Tubificids (Oligochaeta: Tubificidae) - Indicators of the Quality of Water Bodies, (In Russian),
W77-02225 5A

Toxicological Characteristics of Acute Phenol Intoxication in Some Freshwater Worms, (In Russian),
W77-02237 5C

TUCSON (ARIZ)
Pricing Urban Water,
W77-02171 6D

TUCSON BASIN (ARIZ)
The Determination of Seasonal Variations in Groundwater Recharge by Deuterium and Oxygen-18 Analysis for the Tucson Basin, Arizona,
W77-02169 2F

Rational Water Pricing in the Tucson Basin,
W77-02170 6D

TUNNELING
Precast Segments Speed Installation of Thunder Bay Sewer,
W77-02330 8F

TUNNELS
Austin's 11 Mile Sewer Tunnel Reflects Sound Economic, Environmental Alternatives,
W77-02327 5D

TURBULENCE
Grid Turbulence in Hydraulic Models,
W77-02128 8B

Measurements of the Turbulent Boundary Layer Under Pack Ice,
W77-02138 2C

Oblique Impingement of Plane Turbulent Jets,
W77-02464 8B

TWO DIMENSIONAL
Mathematical Models in Hydraulics and Coastal Engineering,
W77-02471 2A

TWO-REGIME FLOW
Investigation of Two-Regime Well Flow,
W77-02142 4B

UCHA RESERVOIR (USSR)
Biological Monitoring: Substantiation and Experience in Organization, (In Russian),
W77-02235 5A

ULTRAFILTRATION
Recovery and Reuse of Alum from water Filtration Plant Sludge by Ultrafiltration,
W77-02371 5D

UNITED KINGDOM
Landfill Research Work in Progress at Harwells Hazardous Materials Service,
W77-02400 5E

UNITED STATES
Surveying America's Lakes.
W77-02375 5C

The Annual Volume of U.S. Precipitation and its Variations for the Period 1931-1971,
W77-02483 2B

UNIVERSITIES
Water Resource Problems and Research Needs of North Carolina,
W77-02181 9D

UNSATURATED FLOW
Transient Movement of Water and Solutes in Unsaturated Soil Systems, Phase II,
W77-02189 2G

UNSTEADY FLOW
Prediction of Mound Geometry Under Recharge Basins,
W77-02144 2F

UPPER MISSOURI RIVER BASIN STATES
Strip-Mining Techniques to Minimize Environmental Damage in the Upper Missouri River Basin States,
W77-02445 5G

UPPER POTOMAC ESTUARY
The Circulation and Salinity Distribution of the Upper Potomac Estuary,
W77-02132 2L

UPPER VOLTA
Applications of ERTS Products in Range and Water Management Problems, Sahelian Zone: Mali, Upper Volta and Niger,
W77-02167 4A

URANIUM
Water Quality Impacts of Uranium Mining and Milling Activities in the Grants Mineral Belt, New Mexico,
W77-02208 5G

URANIUM MILLING
Water Quality Impacts of Uranium Mining and Milling Activities in the Grants Mineral Belt, New Mexico,
W77-02208 5G

URANIUM MINING
Water Quality Impacts of Uranium Mining and Milling Activities in the Grants Mineral Belt, New Mexico,
W77-02208 5G

URBAN DRAINAGE
Utility of Urban Runoff Modeling, (Proceedings of a Special Session, Spring Annual Meeting, American Geophysical Union, Washington, D.C. 14 April 1976.
W77-02076 2A

URBAN DROUGHT
Drought Hazard in the United States: A Research Assessment,
W77-02113 3B

URBAN HYDROLOGY
Synthetic Design Hyetograph and Rational Runoff Coefficient,
W77-02135 2E

Characterization of Urban Runoff,
W77-02180 5B

Maryland Highway Drainage Study: Volume III - A Linked System Model for the Synthesis of Hydrographs in Urban Areas,
W77-02492 4C

URBAN RAINFALL-RUNOFF-QUALITY RELATIONSHIPS
Utility of Urban Runoff Modeling, (Proceedings of a Special Session, Spring Annual Meeting, American Geophysical Union, Washington, D.C. 14 April 1976.
W77-02076 2A

URBAN RUNOFF
Utility of Urban Runoff Modeling, (Proceedings of a Special Session, Spring Annual Meeting, American Geophysical Union, Washington, D.C. 14 April 1976.
W77-02076 2A

Characterization of Urban Runoff,
W77-02180 5B

URBANIZATION
Utility of Urban Runoff Modeling, (Proceedings of a Special Session, Spring Annual Meeting, American Geophysical Union, Washington, D.C. 14 April 1976.
W77-02076 2A

UREAFORM
Initial Release of Nitrogen from Ureaform Under Field Conditions,
W77-02279 3F

USSR
The Effect of Bottom Sediments on Formation of Surface Water Composition, (In Russian),
W77-02259 5B

USSR WATER POLLUTION LEGISLATION
Ways of Preventing Thermal Pollution of Water Bodies by Wastewaters of Nuclear Power Plants, (In Russian),

W77-02474 8B

Water Motion on a Beach in the Presence of a Breakwater: 2. Mean Currents,
W77-02475 8B

An Evaluation of Parameters for the Theoretical Distribution of Periods and Amplitudes of Sea Waves,
W77-02479 2H

Notes on Tidal Inlets on Sandy Shores,
W77-02504 2L

An Effect of Permeability on Sand Transport by Waves,
W77-02508 2L

WEATHER
Economic Impacts of Weather Variability,
W77-02429 3B

WEATHER MODIFICATION
Ecological Impacts of Snowpack Augmentation in the San Juan Mountains of Colorado.
W77-02160 3B

Economic Impacts of Weather Variability,
W77-02429 3B

Inadvertent Weather Modification,
W77-02453 3B

Use of the LANDSAT-2 Data Collection System in the Colorado River Basin Weather Modification Program,
W77-02500 2B

WEATHER RADAR
Use of Radar Information in Determining Flash Flood Potential,
W77-02509 2B

WEATHERING
A Thermodynamic Model for Predicting the Formation, Stability, and Weathering of Common Soil Minerals,
W77-02285 2G

WEED CONTROL
Some Hygienic Problems Related to the Use of Herbicides of the 2,4-Dichlorophenoxyacetic Acid Group, (In Russian),
W77-02231 5G

WELL DATA
Descriptions and Chemical Analyses for Selected Wells in the Central Sacramento Valley, California,
W77-02299 2K

Ground-Water Hydrology of the Cocoa Well-Field Area, Orange County, Florida,
W77-02323 4B

WETLANDS
Evaluation of Estuarine Site Development Lagoons,
W77-02088 5G

Nitrate Removal from Water at the Water-Mud Interface in Wetlands,
W77-02441 5G

WHEAT
Utilization of Nutrients from Wastewater by Wheat,
W77-02112 5D

Influence of Different Water Regimes on Oxygen Diffusion Rates, Nutrient Uptake, Growth and Yield of Wheat,
W77-02177 3F

WHEATGRASSES
Influence of Tall Wheatgrass Wind Barriers on Soil Drying,
W77-02168 4D

WHITE SEA (USSR)
Reactions of White Sea Organisms to a Decrease of Salinity in Connection with Freshwater Discharge into Bays, (In Russian),
W77-02233 2L

WILCOX GROUP
The Meridian-Upper Wilcox Aquifer in Mississippi,
W77-02310 7C

WILDLIFE
Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

WILLAMETTE RIVER (OREG)
Project Development and Data Programs for Assessing the Quality of the Willamette River, Oregon,
W77-02301 2E

WIND EROSION
Influence of Tall Wheatgrass Wind Barriers on Soil Drying,
W77-02168 4D

WIND TIDES
On the Reliability of the Spectral Method for the Design of Offshore Structures,
W77-02129 8B

WINDBREAKS
Influence of Tall Wheatgrass Wind Barriers on Soil Drying,
W77-02168 4D

WINDS
Spectral Characteristics of the Microwave Emission from a Wind-Driven Foam-Covered Sea,
W77-02476 2L

WINKLER TEST
Chemical Catalyst Interference in the Winkler Titration Determination of Dissolved Oxygen -- A Method for Correction,
W77-02564 5A

WISCONSIN
Ground-Water Resources and Geology of St. Croix County, Wisconsin,
W77-02321 4B

WOODS CANYON (ARIZ)
Woods Canyon--A Large Scale Watershed Management Experiment: An Explanation and Interim Report,
W77-02110 3B

WORMS
Tubificids (Oligochaeta: Tubificidae) - Indicators of the Quality of Water Bodies, (In Russian),
W77-02225 5A

Toxicological Characteristics of Acute Phenol Intoxication in Some Freshwater Worms, (In Russian),
W77-02237 5C

WYOMING
Patterns of Leaf Resistance to Lodgepole Pine Transpiration in Wyoming,
W77-02531 2D

X-RAY SPECTROSCOPY
Direct of X-Ray Spectrometric Determination of Bromine in Water,
W77-02457 5A

XYLEM REGENERATION
Ozone and Vascular Tissue Differentiation in Plants,
W77-02439 5C

XYLENE
A Simple Apparatus for Metering Volatile Liquids into Water,
W77-02454 7B

YEASTS
Distribution of Aquatic Yeasts - Effect of Incubation Temperature and Chloramphenicol Concentration on Isolation,
W77-02525 5A

YIELD EQUATIONS
A Bioeconomic Simulation Analysis of Regulating Groundwater Irrigation,
W77-02549 3F

YOSEMITE NATIONAL PARK (CALIF)
Water-Quality Study of a Reach of the Merced River in Yosemite National Park and Vicinity, California--April 1973 Through September 1974,
W77-02309 5A

YOUNGER DRYAS
Climatic Inferences from Former Glaciers in the South-East Grampian Highlands, Scotland,
W77-02467 2C

YUGOSLAVIA
State Consideration of the Rivers Zeta and Moraca Based on the Chemical Control, (In Serbo-Croatiau),
W77-02266 5G

Measures for the Protection of the Rivers Zeta and Moraca, (In Serbo-Croatiiau),
W77-02267 5G

ZAGREB (YUGOSLAVIA)
The Influence of Waste Waters on Algae in the Open Collector of Zagreb at Ivanja Rijeka, (In Croatian),
W77-02268 5C

ZEOLITES
Studies of the Removal of Ammonia Nitrogen by Ion Exchange,
W77-02370 5D

ZERO DISCHARGE
Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Formulated Fertilizer Segment of the Fertilizer Manufacturing, Point Source Category,
W77-02419 5D

Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Phosphorus Derived Chemicals Segment of the Phosphate Manufacturing Point Source Category,
W77-02431 5G

ZETA POTENTIAL
A Study of the Physicochemical Parameters Affecting the Removal of Colloidal Particles from Water by Porous Media,
W77-02086 5D

ZINC
Compilation of State Data for Eight Selected Toxic Substances, Vol. IV, Compilations of Summaries and Analyses of State Data,
W77-02205 5G

Fixation of Iron and Zinc Applied as Chelates into a Soil Column During Leaching,
W77-02280 2G

Interactions of Micronutrients in Barley Grown on Zinc-Polluted Soils,
W77-02287 2G

Soybean Yield Responses and Assimilation of ZN and CD from Sewage Sludge-Amended Soil,
W77-02377 5C

ZOOPLANKTON
Zooplankton of the Region of Nosy-Be: VI. Pteropods, Heteropods: I. Holoneritic and Internal-Neritic Species; Contribution to the Study of a Tropical Eutrophic Bay, (In French),
W77-02416 5C

U. OF I. URBANA-CHAMPAIGN

W77-02297 5G

TOMSK MEDITSINSKII INSTITUT (USSR).
Some Hygienic Problems Related to the Use of Herbicides of the 2,4-Dichlorophenoxyacetic Acid Group, (In Russian),
W77-02231 5G

TORONTO UNIV. (ONTARIO). DEPT. OF PHYSICS.
Evolution of Raindrop Spectra with Collision-Induced Breakup,
W77-02489 2B

UFFICIO CENTRALE DI ECOLOGIA AGRAGIA E DIFESA DELLE PIANTE COLTIVATE DALLE AVVERSITA METEORICHE, ROME (ITALY).
The Hailpad Calibration for Italian Hail Damage Documentation,
W77-02486 2B

UNION CARBIDE CORP., NEW YORK. (ASSIGNEE).
Suspended Sludge Scraper for Arcuate Sedimentation Zone,
W77-02335 5D

UNIVERSITY COLL. OF SWANSEA (WALES).
Investigation of Two-Regime Well Flow,
W77-02142 4B

UNIVERSITY OF EAST ANGLIA, NORWICH (ENGLAND). SCHOOL OF ENVIRONMENTAL SCIENCES.
The Origin of Glacially Fluted Surfaces - Observations and Theory,
W77-02465 2C

A Theoretical Analysis of the Formation of Glacial Flutes,
W77-02466 2C

UPPSALA KOMMUN (SWEDEN). HALSOVARD FORVALTNING.
Some Aspects of Municipal Overflow Reservoir Monitoring, (In Swedish),
W77-02228 5A

UTAH STATE UNIV., LOGAN. DEPT. OF FORESTRY AND OUTDOOR RECREATION.
Methods for Determining Recreational, Environmental, and Economic Consequences of Alternative Development Programs for the Bear Lake Area,
W77-02082 6B

UZBEKSKII NAUCHNO-ISSLEDOVATELSKII INSTITUT SANITARII, GIGIENY I PROFZABOLEVANII, TASHKENT (USSR).
Trace Elements in the Environment of Some Goiter Regions of the Tashkent Oblast, (In Russian),
W77-02388 5G

UZHGOROD STATE UNIV. (USSR).
Extraction-Photometric Determination of Mercury in Soil and Water, (In Russian),
W77-02272 5A

VAN NOTE-HARVEY ASSOCIATES, PRINCETON, N.J.
Spray Irrigation Solves Disposal Problem,
W77-02356 5D

VERMONT UNIV., BURLINGTON. DEPT. OF GEOLOGY.
Sedimentation Rates and Sediment Thicknesses in Lake Champlain: 1975-76,
W77-02193 2J

VERMONT UNIVERSITY, BURLINGTON, DEPT. OF GEOLOGY.
Geologic and Physical Factors Affecting Lake Champlain Shoreline Erosion,
W77-02222 2J

VIBCONSULT, MUNICH (GERMANY).
Modern Separation Processes for Eliminating Waste Water and Sludge Problems in Pulp and Paper Mills (Neuzeitliche Trennungsverfahren zur Beseitigung des Abwasser und Schlammproblemes in Zellstoff- und Papierfabriken),
W77-02569 5D

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. DEPT. OF CIVIL ENGINEERING.
A Model for Predicting Flood Hazards Due to Specific Land-Use Practices,
W77-02078 2A

VIRGINIA UNIV., CHARLOTTESVILLE. DEPT. OF ENVIRONMENTAL SCIENCES.
Silver Content of Precipitation from Seeded and Nonseeded Florida Cumuli,
W77-02485 2K

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INSTITUT GIGIENI I TOKSIKOLOGII PESTITSIDOV, KIEV (USSR).
Effect of Polyvinyl Chloride on Water Microflora, (In Russian),
W77-02386 5C

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INSTITUT ZHELEZNODOROZHNOI GIGIENY, MOSCOW (USSR).
Sanitary-Hygienic Evaluation of the Recycled Water Supply on Railroads, (In Russian),
W77-02241 3E

VSESROSSIISKII NAUCHNO-ISSLEDOVATELSKII INSTITUT, PRUDOVOGO RYBNOGO KHOZYAISTVA, MOSCOW (USSR).
Development of the Chlorococcal Alga Coelastrum Microporum Naeg. in Fish-Breeding Ponds, (In Russian),
W77-02248 5C

WASHINGTON STATE UNIV., PULLMAN.
Phosphate Reduction and Response of Plankton Populations in Kootenay Lake,
W77-02440 5C

WASHINGTON STATE UNIV., PULLMAN. COLL. OF AGRICULTURE RESEARCH CENTER.
Potassium in an Arid Loessial Soil: Characterization by Equilibrium Release-Absorption to Strong Salt Solutions,
W77-02296 2G

WASHINGTON UNIV., SEATTLE. APPLIED PHYSICS LAB.
The Barrow Submarine Canyon: A Drain for the Chukchi Sea,
W77-02481 2L

WASHINGTON UNIV., SEATTLE. COLL. OF FOREST RESOURCES.
Organic Compounds in Pulp Mill Lagoon Discharge,
W77-02558 5A

WASHINGTON UNIV., SEATTLE. DEPT OF GEOPHYSICS.
Measurements of the Turbulent Boundary Layer Under Pack Ice,
W77-02138 2C

WASHINGTON UNIV., SEATTLE. GEOPHYSICS PROGRAM.
Snow Pressure on Rigid Obstacles,
W77-02463 2C

WATER POLLUTION RESEARCH LAB., STEVENAGE (ENGLAND).
Dilution and Design,
W77-02332 5E

WATERLOO UNIV. (ONTARIO). DEPT. OF CIVIL ENGINEERING.
Leachate Attenuation in Undisturbed and Remoulded Soils,
W77-02403 5B

WEST PAKISTAN AGRICULTURAL UNIV., LYALLPUR.
Effects of Phosphorus on Some Physical and Chemical Properties of Clays,
W77-02101 2G

WHITMAN, REQUARDT AND ASSOCIATES, BALTIMORE, MD.
Flow Data Collection for Infiltration-Inflow Analysis,
W77-02334 5D

WINDSOR UNIV. (ONTARIO). DEPT. OF ENGINEERING.
Grid Turbulence in Hydraulic Models,
W77-02128 8B

U. OF I. URBANA-CHAMPAIGN

WISCONSIN UNIV., MADISON. DEPT. OF BOTANY.
Nutritional Ecology of Nuisance Aquatic Plants,
W77-02451 5C

WISCONSIN UNIV., MADISON. DEPT. OF CIVIL AND ENVIRONMENTAL ENGINEERING.
Solid Waste Degradation Due to Shredding and Sludge Addition,
W77-02412 5E

WISCONSIN UNIV., MADISON. DEPT. OF SOIL SCIENCE.
Denitrification of Nitrified Septic Tank Effluent,
W77-02347 5D

WISCONSIN UNIV., MILWAUKEE. DEPT. OF GEOLOGICAL SCIENCES.
Automated Seismic Monitoring System for Lake Michigan Ice Studies,
W77-02468 2C

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS. DEPT. OF BIOLOGY.
Detrital Utilization by the Polychaete, Capitella Capitata,
W77-02435 5C

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS. MARINE POLICY AND OCEAN MANAGEMENT PROGRAM.
Atlantic Offshore Oil: The Need for Planning and Regulation,
W77-02426 6G

WYOMING UNIV., LARAMIE. DEPT. OF BOTANY.
Patterns of Leaf Resistance to Lodgepole Pine Transpiration in Wyoming,
W77-02531 2D

YONSEI UNIV., SEOUL (REPUBLIC OF KOREA). INST. OF ENVIRONMENT POLLUTION RESEARCH.
Growth Factors on Oyster and Water Pollution in South Coastal Area in Korea, (In Korean),
W77-02257 5C

YORK UNIV., DOWNSVIEW (ONTARIO). DEPT. OF GEOGRAPHY.
Economic and Environmental Impacts of Agricultural Land Drainage in Ontario,
W77-02425 4A

ZAGREB UNIV. (YUGOSLAVIA). INSTITUT ZA BIOLOGIJO.
The Influence of Waste Waters on Algae in the Open Collector of Zagreb at Ivanja Rijeka, (In Croatian),
W77-02268 5C

ZAVOD ZA ZASTITU PRIRORA, TITOGRAD (YUGLOSLAVIA).
Measures for the Protection of the Rivers Zeta and Moraca, (In Serbo-Croatiiau),
W77-02267 5G

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.

- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 10, NUMBER 6
MARCH 15, 1977

The Library of the
APR 26 1977
University of Illinois
at Urbana-Champaign

W77-02576 -- W77-03075
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is attached to the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write prices.

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

U. OF I. URBANA-CHAMPAIGN

VOLUME 10, NUMBER 6
MARCH 15, 1977

W77-02576 -- W77-03075

Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

URBAN HYDROLOGICAL MODELING AND CATCHMENT RESEARCH IN CANADA,
Canada Centre for Inland Waters, Burlington Ontario).
. Marsalek.
Reprint of Technical Memorandum No IHP-3, ASCE Urban Water Resources Research Program, American Society of Civil Engineers, New York, N.Y. June 1976; Technical Bulletin No 98, 976. 52 p, 6 fig, 7 tab, 58 ref, 2 append.

Descriptors: *Canada, *Hydrology, *Model studies, Sewers, Urban runoff, Flow, Land use, Data collections, Planning, Storm runoff, Urbanization, Watersheds(Basins), Effects, Monitoring, Overflows, Waste water treatment, Design storm, On-site data collections.
Identifiers: Runoff quality, Undesirable trends, Urban watersheds.

Results of a critical survey of urban test catchment research and urban hydrological modelling in Canada are presented. A catalogue of selected urban test catchments and related research projects was prepared. Information on catchment characteristics, instrumentation, data acquired, analysis performed and data applications was included. The Section on Urban Hydrological Modeling includes descriptions of newly developed models, modifications and refinements of some existing models and selected Canadian engineering applications of urban runoff models. There is a lack of urban runoff data or on-site data collections in Canada. It is recommended that more data collections be made to verify non-calibrated model results. (Environment Canada)

URBAN DRAINAGE MODEL COMPARISON FOR A CATCHMENT IN HALIFAX, NOVA SCOTIA,
Nova Scotia Technical Coll., Halifax.
. H. Waller, W. A. Coulter, W. M. Carson, and . G. Bishop.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 43, Environmental Protection Service, Environment Canada, Ottawa, Canada, August 1976, 35p., 25 fig., 6 tab, ref. 74-8-2.

Descriptors: *Urban runoff, *Rainfall, *Data collections, *Model studies, Storm runoff, Flows, Hydrographs, Costs, Watersheds(Basins), Canada, *Urban drainage, Watershed management.
Identifiers: *Halifax, Nova Scotia, Road Research Laboratory(RRL) Model, United Kingdom, Storm Water Mangement model.

Rainfall-runoff data were collected for a 167.2 acre combined sewer drainage area at Halifax, Nova Scotia. These data were used to compare the performance of the U.K. Road Research Laboratory (RRL) runoff model and the RUNOFF block of the U.S. Environmental Protection Agency Storm Water Management Model. Both models were capable of producing creditable results for a sewerage system that included surcharged pipes and yielded runoff from previous areas in major storms. Calculated peaks were generally earlier and higher than observed values. Agreement improved with the magnitude of storm events. Hydrographs from the models were more similar than were calculated and observed results, especially in larger storm events. The EPA RUNOFF block required more computer time than the RRL model. HYDRAULIC SIMULATION USING DISTRIBUTED PARAMETERS,
Purdue Univ., Lafayette, Ind. Dept. of Agricultural Engineering.
L. F. Huggins, T. H. Podmore, and C. E. Hood.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 078, Price codes: A04 in paper copy, A01 in microfiche. Purdue University Water Resources Research Center, Technical Report No. 82, (1976). 59 p, 7 fig, 11 tab, 16 ref, append. OWRT A-027-IND(2).

Descriptors: *Rainfall-Runoff relationships, *Agricultural runoff, *Overland flow, *Agricultural watersheds, Runoff, Hydrographs, Infiltration, Rainfall intensity, Topography, Erosion control, Sediment yield, Hydraulic similitude, Hydraulic models, Model studies, Path of pollutants.
Identifiers: Distributed parameters, Surface retention, Groundwater percolation.

The distributed watershed model developed was based upon the premise that a watershed could be subdivided into a grid of square elements each sufficiently small in size that all hydrologically significant factors would be uniform within its boundaries. In addition to the resulting ability for simultaneously quantifying the hydrologic performance of every point within the watershed being modelled, this approach allows the use of plot and laboratory data to develop model parameters. A laboratory flow table was constructed which provided simulated rainfall and overland flow on full-scale watershed elements representative of various surfaces. This apparatus was used to study flow over three 'uniformly rough' surfaces created from various sand and gravel-sized particles. A radio telemetry system was designed for the collection of data in the field. Research was directed toward the following objectives (1) development of a parametric relationship between overland flow rate, average flow depth, hydraulic roughness and average slope; (2) evaluation of various techniques to quantify physical surface roughness; and (3) correlation of physical roughness parameters with hydraulic roughness coefficients. The distributed parameter watershed models offer significant advantages to the more conventional lumped models for small watershed and is especially valid for applications related to non-point source pollution. ESTIMATION OF DAILY PRECIPITATION OVER CHINA AND THE USSR USING SATELLITE IMAGERY,
National Environmental Satellite Service, Washington, D. C.
W. A. Follansbee.
NOAA Technical Memorandum NESS 81, September 1976. 33 p, 20 fig, 5 tab, 6 ref.

Descriptors: *Precipitation(Atmospheric), *Clouds, *Meteorological data, Model studies, Rain, Storms, *Asia.
Identifiers: *China, *USSR, Satellite imagery, Infrared imagery, Data analysis.

A technique for estimating precipitation over China and the USSR in late autumn, winter, and early spring, using satellite data is described. The data consisted of NOAA-4 infrared imagery taken at approximately 9 a.m. and 8 p.m., local time, and visual pictures taken near 9 a.m. local time, all with one-half mile resolution. The major human input to the technique is identification of precipitating clouds in the infrared imagery, aided by inspection of the visual pictures. The technique consists of three steps: delineate the area(s) covered by precipitating clouds in each of two consecutive infrared images taken at approximately 12-hour intervals; using cloud motion models developed for the purpose, delineate the envelope of precipitation and isopleths of duration of precipitation in hours; and using an empirically derived relationship between duration of precipitation and the percentage of monthly normal precipitation, estimate amounts of precipitation for the 12-hour period at each grid point in the area of interest. A SHEARED COORDINATE SYSTEM FOR STORM SURGE EQUATIONS OF MOTION WITH A MILDLY CURVED COAST,
National Weather Service, Silver Spring, Md. Techniques Development Lab.
C. P. Jelesnianski.
NOAA Technical Memorandum NWS TDL-61, July 1976. 56 p, 10 fig, 10 ref, 3 append.

Descriptors: *Storm surge, *Storms, United States, Coasts, Numerical analysis, Mathematical models, Equations.
Identifiers: *Storm tracks, *Tropical storms, *Sheared coordinate system, Equations of motion.

To improve numerical computations of coastal storm surges, a mildly curved coastline is shifted or sheared onto a straight 'baseline'. A surface plane, truncated from the ocean shelf and containing the curved coast as a boundary, is fitted with a curved, non-orthogonal grid. The plane with curved boundaries is then transformed via a sheared coordinate system onto an image rectangle. In the transformed system, the computational grid is cartesian, orthogonal, equally spaced, and the coast lies exactly on and not across a grid line. Linearized transport equations of motion for storm surges are modified to accommodate the sheared coordinate system. A surge model, incorporating the sheared system, is now fully opera-

tional for 3000 mi. of United States coasts, from the Mexican.American border in the Gulf of Mexico to the east end of Long Island, New York. The model can run with curvilinear storm tracks, changing storm celerity along the track, and changing storm parameters such as intensity and size. (NOAA)

OPTIMAL RAINGAGE DENSITIES AND ACCUMULATION TIMES: A DECISION-MAKING PROCEDURE,
Oklahoma Univ., Norman. Dept. of Meteorology.
A. Eddy.
Journal of Applied Meteorology, Vol 15, No 9, p 962-971, September 1976. 12 fig, 3 ref. Bu. Rec. 14-060-D-7633.

Descriptors: *Rainfall, *Rain gages, *Networks, *Illinois, Network design, Data processing, Model studies, Mathematical models, Measurement, Rain, Precipitation(Atmospheric), Analytical techniques, Meteorology.
Identifiers: Raingage densities, Accumulation times.

The requirement addressed by this study is that of estimating the rainfall over a given area within a given accuracy. Decision criteria were given explicitly, historical data sets were used to obtain the necessary statistics, an optimal interpolation objective analysis (x,y,t) was used to estimate the rainfall, and specific gage density and accumulation times were deduced. Some of the hazards associated with the modeling were discussed. (Sims-ISWS)
W77-02798

ACID PRECIPITATION,
Cornell Univ., Ithaca, N.Y. Section of Ecology and Systematics.
G. E. Likens.
Chemical and Engineering News, Vol. 54, No. 48, p 29-44, November 22, 1976. 19 ref.

Descriptors: *Chemistry of precipitation, *Precipitation(Atmospheric), *Hydrogen ion concentration, Rainfall, Snowfall, Acidity, Acidic water, Lakes, Aerosols, Fish, Pollutants, Air pollution, Air pollution effects, Path of pollutants, Water pollution , Water pollution sources, Sulfur, Nitrogen, Fossil fuel, Chemistry, Meteorology.
Identifiers: *Acid precipitation.

The acidity of rain and snow falling on widespread areas of the world has been rising during the past two decades or so. The consequences of this phenomenon have yet to be fully evaluated, but acid precipitation clearly seems to have had a far-reaching environmental impact. It has been linked to sharp declines--in some cases to the point of total extinction--in the number of fish in many lakes and streams. Evidence also suggests that acid rain, snow, and aerosol particles may be damaging trees and other plants. In addition, the increased acidity enhances the weathering and corrosion of materials and buildings. Some scientists also suggest that acid aerosols are an added threat to human health. Nevertheless, there is still considerable disagreement about the sources for the acid-forming components and about the severity of the effects. The long-run social and economic problems associated with acid precipitation and its control are particularly complex and vexing since rain and snonw are not confined by existing political boundaries. To explore these problems and to get a clearer picture of the cause and effect of acid precipitation, research activity has recently blossomed in the U.S. and aboard. The results of this research were reviewed in this paper. (Sims-ISWS)

MICROCLIMATIC PATTERNS ON THE ARID LANDS ECOLOGY RESERVE,
Northwest Coll. and Univ. Association for Science, Richland, Wash.
J. T. Rotenberry, W. T. Hinds, and J. M. Thorp.
Northwest Science, Vol 50, No 2, p 122-130, 1976. 4 fig, 4 ref.

Descriptors: *Microclimatology, *Arid lands, Climatology, Mathematical models, *Washington, Climates, Climatic data, Meteorology, Weather data, Precipitation(Atmospheric), Rainfall, Deserts, Isohyets, Isotherms, *Micrometeorology, Correlation analysis, Mathematical studies, Ecosystems.

Within zonal climates, which are determined by latitude, distance from oceans, and elevation, lie a multitude of microclimates which are largely distinguished by localized differences in slope, exposure, elevation and local topography. Plants and animals usually are adapted to the zonal climates, but they must live in or avoid the microclimates. Cluster analysis of correlation coefficients is employed to detect microclimatic patterns within a 27-station network in a topographically diverse region of southeastern Washington. The data consist of monthly precipitation and maximum and minimum temperatures. A mathematical model was employed to determine the similarity in pattern between any two stations. Precipitation patterns showed the greatest variability of the three measures considered. The analyses show that patterns of temperature and precipitation may produce significantly different microclimatic patterns. Further research in relating microclimates to landscapes and plant community structure to the various microclimatic variables or clusters that have been measured is suggested. (Jamail-Arizona)

2C. Snow, Ice, and Frost

AN ANALYSIS OF GREAT LAKES ICE COVER FROM SATELLITE IMAGERY,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
B. B. Hagman.
NOAA Technical Memorandum ERL GLERL-9, April 1976. 15 p, 3 ref, 5 tab, 2 fig.

Descriptors: *Great Lakes, *Ice cover, *Remote sensing, Reflectance, Measurement.
Identifiers: *Satellite imagery, *Navigation season, Surface reflectance.

Remotely sensed satellite data present a synoptic view of the distribution and extent of the Great Lakes ice cover. Although there are several reasons for extracting ice-cover information from satellite imagery, the major reason is the desire to extend the navigation season on the Great Lakes. One method of obtaining this type of information is to measure satellite transparency density a then correlate calculated surface reflectance w ice-cover concentration. But the use of tra parencies presents several difficulties, such as t problem of variable film densities. Because of t variability inherent in satellite transparencies a inaccurate ground verification data, it is desira to find a better method of extracting ice-cover formation. (NOAA)

GREAT LAKES ICE COVER, WINTER 1974-7
National Oceanic and Atmospheric Administ tion, Ann Arbor, Mich. Great Lakes Environm tal Research Lab.
G. A. Leshkevich.
NOAA Technical Report ERL 370-GLERL March 1976. 43 p, 29 fig, 2 ref, append. Also GLERL Contribution No. 78.

Descriptors: *Great Lakes, *Ice co *Meteorological data, *Iced lakes, *Lake *Weather data, Data processing, Charts, Clim data.
Identifiers: *Ice charts.

From ice-cover data received at the Great La Environmental Research Lab. during the winter, twenty composite ice charts w produced to illustrate estimated ice distributi and concentrations on the Great Lakes at wee intervals from mid-December, 1974, through end of April, 1975. Freezing degree-day accum tions indicate that the 1974-75 winter was near mal for Lakes Superior, Michigan, and Huron, between mild and normal for Lakes Erie and tario. Accumulations were near their seas maximum near mid-April on northern portion the Great Lakes and at mid-March on south portions. Skim ice was reported in late Novem but it wasn't until near mid-January that rapid extensive ice growth took place. Ice growth c tinued through mid-February, when ice co reached their maximum extent on all the lakes the exception of Lakes Superior and Onta where they occurred near mid-March. Maxim ice extent was estimated to be 30% on Lake perior, 25% on Lake Michigan, 45% on L Huron, 80% on Lake Erie, and 16% on Lake tario. Warmer temperatures during the latter of February caused significant loss of ice on a the lakes. Last reports of ice on the northern l came during the latter part of April. (NOAA)

2D. Evaporation and Transpiration

THE MEASUREMENT AND ESTIMATION OF POTENTIAL EVAPOTRANSPIRATION,
SCITRAN, Santa Barbara, Calif.
U. Wendling.
NASA Technical Translation F-16, 671, December 1975. 25 p, 4 fig, 6 tab, 21 ref. Translated from Zur Nessung und Schatzung der potentiellen Verdunstung, Zeitschrift fur Meteorologie, Vol. 25, No. 2, p 103-111, 1975.

Descriptors: *Evapotranspiration, *Forest watersheds, *Measurement, *Instrumentation, Estimating, Reservoirs, Formulation, Meteorological data, Precipitation(Atmospheric), Groundwater, Equation, Probability.
Identifiers: *Potential evapotranspiration, *Thornthwaite, *Turc, Evapotranspiration instrument, Formulas, Forested land.

Values of potential evapotranspiration, measured over 10 years by a Thornthwaite evapotranspiration instrument (modified by Mather), were compared with estimates made by various formulas. The method most suitable for the assessment of the potential evapotranspiration on the bsis of readily available meteorological data was the one by Turc, which provided values that were, on the average, lower by 6%. The evapotranspiration installation designed by Thornthwaite was based on maintaining a constant water content near the field capacity in a sufficiently large evaporation container filled with earth and covered with growing grass. In this study, a constant groundwater level adjusted itself in the evaporation container by means of a float system. Depending on the ratio of precipitation and evaporation, a certain amount of water flowed in or out past valves and could be measured. (Roberts-ISWS)

FINITE-STATE MODELS OF TRANSPORT PHENOMENA IN HYDROLOGIC SYSTEMS,
Arizona Univ., Dept. of Hydrology and Water Resources.
M. E. Campana.
Ph.D. Dissertation, 1975. 252 p, 20 fig, 28 tab, 73 ref, 2 append.

Descriptors: *Sediment transport, *Hydrologic systems, *Aquifer systems, *Model studies, Steady flow, Unsteady flow, Texas, Arizona.
Identifiers: *Finite-state models, *Transport models, *Mixing-cell models, Tucson Basin Aquifer, Edwards Limestone Aquifer(Texas).

Two aquifer systems are analyzed using finite-state models (FSMs) which simulate transport phenomena in hydrologic systems. The FSM involves a mixing cell as the basic subdivision but is more flexible than a mixing-cell model in that it can describe more complex systems and is easier to manipulate. The two models are described and compared and distribution functions of the FSM are outlined. A three-dimensional steady-flow FSM is used to account for observed carbon-14 age distribution in a portion of the Tucson Basin Aquifer, without assuming piston flow in the aquifer or evaluating dispersion parameters. This model provides a first approximation of three-dimensional flow distribution, an estimate of long-term average annual recharge, and fluid residence times in the aquifer. A two-dimensional and non-steady flow FSM is used to account for transient tritium distribution in the Edwards Limestone aquifer of south-central Texas. The aquifer is highly anistropic and nonhomogeneous karst, ordinarily difficult to model. The FSM can simultaneously model mass and fluid transport in a hydrologic system, and has the potential for modeling heat transport. (Jahns-Arizona)

DIGITAL-SIMULATION MODEL OF THE WENONAH-MOUNT LAUREL AQUIFER IN THE COASTAL PLAIN OF NEW JERSEY,
Geological Survey, Trenton, N. J. Water Resources Div.
B. Nemickas.
Open-file report 75-672, January 1976. 42 p, 20 fig, 3 tab, 28 ref.

Descriptors: *Computer models, *Aquifer characteristics, *Drawdown, *Hydrologic properties, *New Jersey, Coastal plains, Leakage, Groundwater movement, Transmissivity, Aquitards.
Identifiers: *Wenonah-Mount Laurel aquifer(NJ).

A digital computer simulation model of the Wenonah-Mount Laurel aquifer is used to evaluate the aquifer's ability to meet projected future demands and to study the cause of the rapidly declining water levels. The modelled area covers 1,500 square miles of the New Jersey Coastal Plain. All important pumping centers in Monmouth, Burlington, and Ocean Counties are included. The model was calibrated by matching computed declines in the Wenonah-Mount Laurel aquifer historic water-level declines over the 12-year period 1959-70. The results of the modelling show that recharge to the aquifer occurs from the upper confining unit due to pumpage from the aquifer and of equal significance is the effect of water-level declines in the underlying Englishtown aquifer which generate leakage from the Wenonah-Mount Laurel aquifer through the lower confining unit which in turn generates leakage (recharge) to the aquifer from the upper confining unit. The rapid declines of water levels in the Wenonah-Mount Laurel aquifer in the northern part of the New Jersey Coastal Plain are caused by the direct withdrawals from the Wenonah-Mount Laurel aquifer and indirectly from the withdrawals from the underlying Englishtown aquifer. WATERLOGGING IN AN ALLUVIAL AQUIFER NEAR LAKE MINNEQUA, PUEBLO, COLORADO,
Geological Survey, Lakewood, Colo. Water Resources Div.
P. J. Emmons.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 560, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Investigations 76-53, July 1976. 34 p, 6 fig, 4 plates, 4 tab, 12 ref.

Descriptors: *Colorado, *Alluvial aquifers, *Saturated soils, *Surface-groundwater relationships, Aquifers, Hydrogeology, Water storage, Lakes, Reservoirs, Seepage, Water table, Groundwater movement.
Identifiers: *Waterlogging, *Pueblo area(Colo).

The Lake Minnequa area, located immediately south of the Arkansas River near Pueblo, Colo., is mantled with as much as 46 feet (14 meters) of alluvium covering bedrock of Pierre Shale and Niobrara Formation. Surface water enters the area by the Minnequa Canal and the St. Charles Flood Ditch. The water is stored in Lake Minnequa and other reservoirs. Seepage from St. Charles Reservoirs No. 2 and No. 3 is the major source of water to the alluvial aquifer. The depth of the water table ranges from 0 to 40 feet (0 to 12.2 meters). An 0.5-square-mile (1.3-square-kilometer) area im-

U. S. Dept. of Int. URBANA-CHAMP...

mediately south of Lake Minnequa has a water table less than 6 feet (1.8 meters) below land surface. Lake Minnequa is the principal cause of the shallow water table and resulting waterlogged soil. The bedrock hill east of Lake Minnequa and ground-water flow also contribute to the problem. To eliminate the waterlogging problem, the water table would have to be at least 6 feet (1.8 meters) below land surface. Possible alternatives for eliminating the problem include lowering the water level in Lake Minnequa, placing a network of dewatering wells, or constructing a drainage system in the waterlogged area. (Woodard-USGS)
W77-02983

GROUND-WATER RESOURCES OF WILSON COUNTY, NORTH CAROLINA,
Geological Survey, Raleigh, N.C. Water Resources Div.
M. D. Winner, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-258 496, Price codes: A05 in paper copy, A01 in microfiche. Water-Resources Investigations 76-60, June 1976. 85 p, 38 fig, 6 tab, 19 ref.

Descriptors: *Groundwater resources, *Groundwater availability, *Aquifer characteristics, *Water quality, *Water supply, Water yield, Pumping, Drawdown, Groundwater recharge, Groundwater movement, Water level fluctuations, Hydrologic data, Specific capacity, Hydrogeology, Surface-groundwater relationships, Transmissivity, Storage coefficient, Hydraulic conductivity, *North Carolina.
Identifiers: Wilson County(NC).

The most important sources of ground water for Wilson County, North Carolina are (1) the sand beds of the Cretaceous aquifer system in the Coastal Plain section in the eastern part of the county and (2) the bedrock aquifer system in the Piedmont section in the western part of the county. The Cretaceous aquifer is recharged from leakage through overlying beds composed primarily of clay. This leakage rate averages about 67,000 gallons per day per square mile. Present withdrawals from the Cretaceous aquifer average about 740 gallons per day per square mile. Most of the withdrawals from the Cretaceous aquifer are in the Saratoga-Stantonsburg area in eastern Wilson County around which a widespread decline in water level has occurred in the aquifer. Since 1942, the rate of decline has averaged nearly 1.5 feet per year in the center of the pumping area. Availability of water to the bedrock aquifer ranges from about 67,000 gallons per day per square mile in the Coastal Plain section of the county to about 630,000 gallons per day per square mile in the Piedmont section. Present pumpage from the bedrock aquifer in the Piedmont section is estimated to be about 2,300 gallons per square mile. Ground-water quality is generally good in the Cretaceous and bedrock aquifers, except iron concentrations in the water exceed 0.3 milligrams per liter nearly everywhere in the county. (Woodard-USGS)

Identifiers: Ket, Tym, Ob river, USSR.

Data from a study of the sandy podzolic soils the central taiga region of the Ket and Tym tribu ries of the Ob River (USSR) are presented, sho ing that groundwater moisture has a diverse eff on the formation of the podzolic profile of sandy soils depending to a considerable extent the material and texture of the sands. A distin relation was established between the thickness the podzolic horizon of the soils and the depth ground waters and composition of the arenaceo parent rocks. The considerable effect of the co position of the arenaceous parent rocks on the f mation of hydromorphic podzols must be co sidered in the classification and in the econo development of sandy soils.

STUDIES ON SOIL CONSISTENCY: I. CO PREHENSIVE INVESTIGATIONS OF T CONSISTENCY, (IN JAPANESE),
Y. Sato, and Y. Yumura.
Bull Tokaikinki Natl Agric Exp Stn 28, p 1-1975.

Descriptors: *Soils, *Soil tests, *Soil properti *Soil moisture, *Soil physical properti *Cohesive soils, Soil structure, Shrinkage, Sh strength, Soil density, Humus, Plasticity index.
Identifiers: *Soil consistency, Red-Yellow so Clay soils, Red soils.

Soils (27) derived from various parent mater were tested and the properties comprised by term consistency determined. The mutual relati ships among these properties and the relationsh between consistency and other general proper of soils were examined. The soils of su moisture retention capacity tended to have su shrinkage limit, large shrinkage ratio and la volume weight. Cohesion in most red-yellow s was very strong near the moisture level where color changes from dark to light, and weakened further drying. The soils of clay content gener exhibited stronger adhesion, except the soils w high humus content and most red soils. A st was made on a numerical standard for evaluat the magnitude of plasticity. Cohesion, granu cohesion, shear strength, shrinkage ratio plasticity showed highly positive correlati among themselves. The shear strength-moist content curve and cohesion-moisture cont curve were similar in shape. Expression of the content per unit volume markedly increased coefficient of correlation between the clay cont and each property in consistency. The b exchange capacity and the humus content sho

positive correlations with the moisture retention capacity and negative correlations with shrinkage ratio.--Copyright 1976, Biological Abstracts, Inc.

EFFECT OF IRRIGATION ON SOME PROPERTIES OF SOUTHERN CHERNOZEMS, (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Soil Science.
B. G. Rozanov, A. P. Dzhindil, and M. A. Abdel'Mottalib.
Biol Nauki (MOSC) 18(5), p 111-116, 1975.

Descriptors: *Irrigation effects, *Chernozems, *Soil groups, *Salt balance, *Soil chemical properties, Salts, Drainage effects, Humus, Nitrogen, Sodium, Chlorine, Calcium, Carbon, Acidic soils.
Identifiers: Humates, USSR, Biochemical regime(Soils), Carbon/nitrogen ratio(Soils), Acid mobility(Soil), Odessa, Rostov.

The change of the salt and biochemical regime of southern chernozems under the effect of irrigation with inadequate drainage in the Odessa and Rostov areas (USSR) was studied. The content of humus and N in the soils during the 1st years of irrigation had a tendency to increase. As a result the C:N ratio narrowed. With inadequate drainage the content of salt in southern chernozems increases. With an increase of the number of years of irrigation there is a trend to a relative increase of the proportion of Na and Cl ions in the salt composition. This may explain the increase of mobility of humic acids in the soil profile, since with an increase of the content of Na ions in solution, mobile sodium humates are more active then the less mobile Ca salts.--Copyright 1976, Biological Abstracts, Inc.

THE AERATION CONDITIONS OF SOUTHERN AND CISCAUCASIAN CHERNOZEMS UNDER IRRIGATION, (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of General Soil Sciences.
N. G. Zborishchuk.
Vestn Mosk Univ Ser VI Biol Pochvoved 30(4), p 95-101, 1975.

Descriptors: *Aeration, *Irrigation, *Soil groups, Chernozems, Crops.
Identifiers: Ciscaucasian area(USSR), Eggplant, USSR, *Soil aeration.

The soil aeration of the ciscaucasian chernozems (USSR) deteriorated to a large extent, particularly during the 1st few years of irrigation; that of the southern chernozems remains unchanged. The effectiveness of the aerationpores in a given period of time is denoted by a common index, the 02 C02 ratio, which depends upon the physical conditions of the soil and themicrobiological and biochemical processes taking place in it. An attempt was made to group the soils according to their aeration conditions. (Various crops including eggplant are discussed.) --Copyright 1976, Biological Abstracts, Inc.

EFFECT OF TEMPERATURE ON DENITRIFICATION RATE IN SOILS,
Instytut Uprawy Nowozenia i Gleboznawstwa, Szczecin (Poland).
G. Stanford, S. Dzienia, and R. A. Vander Pol.
Soil Science Society of America Proceedings, Vol. 39, No. 5, p 867-870, September-October 1975. 3 fig, 1 tab, 12 ref.

Descriptors: *Denitrification, *Temperature, Soils, *Soil investigations, Organic matter, Soil chemistry, Nitrogen, Nutrients.
Identifiers: *Temperature coefficient(Denitrification).

The effect of temperature on denitrification rate was studied with nine soils differing widely in organic matter content and chemical and physical

U.S.D.A. - URBANA-CHAMPAIGN

characteristics. In the range of 15 to 35C, the temperature coefficient of denitrification, Q10, was approximately 2. Denitrification rates at 35 and 45C were similar. Between 10 and 5C, denitrification rate declined abruptly. The lower limit of the temperature range conforming to a Q10 of 2 was estimated to be 11C. In this study of water-logged soils sealed from the atmosphere, denitrification appeared to obey first-order kinetics. (Skogerboe-Colo St)

Soil Science Society of America Proceedings, Vol. 39, No. 6, p 1056-1063, November-December 1975. 5 fig, 4 tab, 25 ref.

Descriptors: Soils, *Soil physical properties, Soil investigations, *Aluminum, *Iron oxides, Soil chemistry, Soil chemical properties, *Clays, Aggregate, Illite, Kaolinite.
Identifiers: Soil swelling, Soil drying.

Compressed discs of an illite, a kaolinite, and a mixture of the two were formed from freeze-dried dispersed suspensions of the clays, into which one level of Fe(OH)3 and two levels of Al(OH)3 had been precipitated. The precipitated Fe was found to consist of particles about 40A in diameter and amorphous to X-ray, rather than the acicular goethite that precipitates under similar conditions in the absence of clay. It was deduced from N2 and water vapor sorption measurements that the precipitated Al was presented as very thin layers on the surface of the clay particles, which in the case of the illite could bridge some of the particles. Their form was generally indeterminate, in contrast to the well-crystallized bayerite formed in the absence of clay. All three hydroxy treatments inhibited the double-layer swelling of the Na-illite and Na-Kaolinite/illite mixture in dilute NaCl solutions. Both on weight percent and on an equimolar basis, Al was more effective than Fe in reducing the slaking of dry clay discs and in increasing the resistance of clay to dispersion in pyrophosphate solutions. SUPERSATURATION PHENOMENA AND THE FORMATION OF FLUORAPATITE IN AQUEOUS SUSPENSIONS OF PHOSPHATE ROCK,
Washington Univ., St. Louis, Mo.
S. H. Chien, D. R. Wier, and C. A. Black.
Soil Science Society of America Proceedings, Vol. 39, No. 1, p 43-47, January-February 1975. 1 fig, 4 tab, 14 ref.

Descriptors: *Acids, *Rocks, Rock properties, Soil investigations, *Supersaturation, Soil chemistry.
Identifiers: *Fluorapatite, *Phosphate rocks.

Dilute HCl solutions equilibrated with Florida phosphate rock and Tennessee brown phosphate rock in the presence of solid fluorite developed a condition of supersaturation with respect to fluorapatite at 25C. In suspensions boiled before equilibration at 25C, however, the solutions were in equilibrium with fluorapatite, as evidenced by ion-activity products for fluorapatite in the solutions. LAKE ST. CLAIR BEGINNING-OF-MONTH WATER LEVELS AND MONTHLY RATES OF CHANGE OF STORAGE,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
R. N. Kelley.
NOAA Technical Report ERL 372-GLERL 13 May 1976. 16 p, 1 fig, 5 tab, 1 ref. Also as GLERL Contribution No. 74.

Descriptors: *Water levels, *Water level fluctuations, Lakes, Data analysis, Charts, *Michigan.
Identifiers: *Lake St. Clair(Mich)

Lake St. Clair water level gage data are used to determine beginning-of-month water levels and monthly rates of storage change for the years 191 through 1975 for scientific and planning purposes. Analysis of the results indicates that additional gages, strategically located, are needed for improved accuracy. Beginning-of-month values are needed for scientific and planning studies in many fields, such as lake hydrology, beach and shore erosion, navigation, hydroelectric power generation, and lake level regulation. Monthly rates of change of lake storage, which are derived from the beginning-of-month levels, are needed in water budget studies involving net basin supplies, groundwater flows and lake evaporation. Verhandlungen Internationale Vereinlgung fur Theoretische und Ungewandte Limnologie, Vol. 19, p. 922-931, October, 1975. 1 tab., 8 fig., 6 ref.

Descriptors: Shallow water, Habitats, *Benthos, *Benthic faunal, *Zooplankton, *Seasonal, *Temperature, Environmental effects, *Variability, *Aquatic populations, *Biological communities, *Sediments, Depth, Aquatic animals, Fluctuations, Animal populations, Aquatic environment, *Lake Michigan.

Benthic macroinvertebrates from a shallow inshore area of Lake Michigan were described in terms of species composition and seasonal or year-to-year variations as part of preoperational investigations near a nuclear power plant. Major changes in zoobenthic species composition, lifespan and abundance, and magnitude of seasonal fluctuations were related to increasing depth. The approximate lower limit of epilimnetic temperatures in summer was at the conceptual boundary of 16 m and was only slightly deeper than the shallowest occurrence of noticeable amounts of silt-sized particles in the sediments. Much of the seasonal and year-to-year variation was due to small Chironomidea and Naididae. Rapid increases in early summer occurred soon after spring warming and phytoplankton blooms. (Katz)

SUCCESSIONS OF THE VEGETATION COVER ON THE DRYING BOTTOM OF LAKE SEVAN, (IN RUSSIAN),
Akademiya Nauk Armyanskoi SSR, Erevan. Institut Geologicheskikh Nauk.
R. O. Geodakyan.
Biol Zh Arm 28(4), p 62-67, 1975.

Descriptors: *Vegetation establishment, *Ecotypes, *Emerging vegetation stage, *Speciation, *Dry beds, Lake stages, Lake beds, Succession.
Identifiers: Armenian-SSR, *Lake Sevan, USSR.

In connection with a drop in the level of Lake Sevan (Armenian SSR(USSR)) about 210 km2 of its bottom has been freed of water. Observations were carried out in 1969, 1970 and 1973 on the southwestern shore, where the width of the dry strip is 1210-1850 m. The purpose was to determine the direction of development of the vegetation cover and rate of its change. The habitat changes of the plants in the dry shore strip are giving rise to a succession from hydro- and hygrophilic species to mesophilic species.--Copyright 1976, Biological Abstracts, Inc.

CIRCULATION, DIFFUSION AND FRONTAL DYNAMICS IN THE COASTAL ZONE,
Woods Hole Oceanographic Institution, Mass.
G. T. Csanady.
Journal of Great Lakes Research, Vol. 1, No. 1, p 18-32, October 1975. 8 fig, 7 ref. NOAA 03-5-022-26.

Descriptors: *Great Lakes, *Lake Ontario, *On-site investigations, *Circulation, Water circulation, Diffusion, Currents(Water), Flow, *Coasts, Jets, Velocity, Distribution patterns, Boundary layers.

A status report on coastal boundary layer research in the Great Lakes is given. The 'first order' or longshore flow is now understood in terms of the conceptual models of coastal jets, Kelvin waves, and topographic waves. Secondary flow perpendicular to shore ('cross-flow' for short) is less well understood, although its understanding is crucial for a parametrization of the mass exchange between coastal zone and midlake. Various contributions to cross-flow were discussed, and their importance in the mass exchange process estimated. (Humphreys-ISWS)

A SIMPLE DISPERSION MODEL OF THE MEAN CONCENTRATION FIELD IN THE WESTERN AND CENTRAL BASINS OF LAKE ERIE,
Canada Centre for Inland Waters, Burlington (Ontario).
P. F. Hamblin.
Journal of Great Lakes Research, Vol 1, No 1, p 92-100, October 1975. 6 fig, 10 ref.

Descriptors: *Great Lakes, *Lake Erie, *Model studies, *Dispersion, Lakes, Mathematical models, Theoretical analysis, Equations, Diffusion, Flow, Circulation, Chlorides, Distribution patterns, Potential flow.
Identifiers: Concentration gradient.

A method of determining horizontal eddy diffusivities appropriate to scales of motion lying at the upper limit of those present in large lakes was based on the comparison of a set of simple solutions of the advection diffusion equation to the mean concentration field of a soluble material. Two features of the annually averaged distribution of the chloride ion in the western and central basins of Lake Erie, namely the sharp gradient of concentration in the vicinity of Pelee Island and the broad plume in the eastern half of the central basin, are best accounted for by a horizontal eddy diffusivity of 3,000,000 sq cm/s. The influence on the dispersal of a dissolved substance by a two-dimensional obstacle placed upstream from a steady source was described and used to account for the concentration gradient occurring between the central and the eastern basins. (Humphreys-ISWS)

OBSERVATIONS OF THE KELVIN-HELMHOLTZ INSTABILITY IN LABORATORY MODELS AND FIELD EXAMPLES OF THERMAL PLUMES,
Old Dominion Univ., Norfolk, Va. School of Engineering.
J. M. Kuhlman, and J. M. Prahl.
Journal of Great Lakes Research, Vol 1, No 1, p 101-115, October 1975. 9 fig, 21 ref.

Descriptors: *Lake Erie, *Lakes, *Laboratory tests, *Jets, *Model studies, Buoyancy, Hydraulic models, Heated water, Stability, Water temperature, Temperature, Velocity, Distribution patterns, On-site tests, Vortices, Aerial photography, Ohio.
Identifiers: *Cuyahoga River(Ohio), *Thermal plumes, Densimetric Froude number.

Buoyant, rectangular thermal plumes were modeled in a 2 by 7 meter laboratory water table facility. The plume entered at right angles to a constant temperature, uniform crossflow of depth equal to that of the plume. Highly buoyant plumes (0.16 less than Fr less than 2) were investigated. Fr is densimetric Froude number. Velocity, temperature, and dye measurements were made using a scanning infrared camera, thermistors, dye injection, and a temperature-compensated hot film anemometer. A Kelvin-Helmholtz instability was observed in the plume thermocline for Fr less than 0.50. For the same values of Fr, a cold water wedge penetrated beneath the plume into the plume discharge channel. A series of transverse line vortices quickly grew in the thermocline to cover the vertical extent of the plume, moving nearly with a mean flow. These vortices were visible both by dye injection into the thermocline and surface infrared imagery. Local gradient Richardson (Ri) numbers fell below 1/4 in the thermocline for all plumes observed (Fr less than 1), but above Fr = 0.50, the Kelvin-Helmholtz instability was dominated by randomized turbulent mixing. This vortex instability was also observed in aerial infrared photographs taken by NASA of the Cuyahoga River mouth entering Lake Erie. Field measurements indicated that Ri is less than 1/4 in the thermocline at the river mouth. (Humphreys-ISWS)

RECONSTRUCTION OF SOME OF THE EARLY STORM SURGES ON THE GREAT LAKES,
Department of the Environment, Ottawa (Ontario). Ocean and Aquatic Affairs.
T. S. Murty, and R. J. Polavarapu.
Journal of Great Lakes Research, Vol 1, No 1, p 116-129, October 1975. 10 fig, 3 tab, 20 ref, 1 append.

Descriptors: *Great Lakes, *Surges, *Water level fluctuations, *Lake Erie, Water levels, On-site data collections, Analytical techniques, Storms, Weather patterns, Meteorological data.

Some early (pre-World War II) storm surges on the Great Lakes which produced storms that were extensive enough to influence the whole Great Lakes system were reconstructed making use of scant meteorological and oceanographic data and descriptions from popular literature. Port Colborne, on the northeastern shore of Lake Erie, exhibited consistently great storm surges. Negative surges were observed in narrow connecting waters such as the Detroit River. The simple analytical techniques used showed that the water level changes could be accounted for mostly by the large-scale pressure system. An appendix briefly described some of the analytical formulae that were used. It should be made clear that the choice of the parameters for these analytical formulae is rather uncertain, and the accuracy of the estimate is + or - 0.5 feet. Hence, the reconstruction was not attempted for surges with amplitudes less than one foot. (Humphreys-ISWS)

LAKE WHITEFISH (CORREGONUS CLUPEAFORMIS (MITCHILL) IN SOUTHERN INDIAN LAKE, MANITOBA,
Fisheries and Marine Service, Winnepeg (Manitoba).
H. A. Ayles.
Canada Fisheries and Marine Service Technical Report No. 640, 1976. 34 p. 3 fig., 9 tab., 41 ref

Descriptors: *Baseline studies, *Fish populations, *Canada, Commercial fishing, Food habits, Growth stages, Fish reproduction, Spawning, Mortality, Size, Age, Fish eggs.
Identifiers: *Southern Indian Lake(Manitoba), *Whitefish, Coregonus clupeaformis.

The spawning and population characteristics of lake Whitefish, from Southern Indian Lake, Manitoba, were investigated as part of an effort to establish baseline data prior to the completion of a major hydroelectric development in the region. Whitefish spawn in October or November over areas of large boulders or broken rocks in depths of 1 to 7 meters. Low temperature appeared to trigger the spawning act. The average spawning age for both males and females was 8.8 years, with an average egg count of 28,600. Growth and condition were good for lake whitefish in most regions of the lake, though whitefish from South Bay did not appear to grow as quickly. Different year class strengths were suggested by variation in mean age, weight, and length between whitefish sampled in 1974 versus those sampled in 1972. Principal food items were amphipods, sphaeriids, gastropods and chironomid larvae. Mortality rates varied from 0.43 to 0.70. The flow of the Churchill River through Southern Indian Lake has a strong positive influence on its productivity, resulting in a significant commercial whitefish fishery. Commercial fishing of whitefish has yielded an average of 400,000 kilograms per year since 1942. (Luedtke-Wisconsin)

Available from the National Technical Inform tion Service, Springfield, Va. 22161 as AD/A-0 022, Price codes: A04 in paper copy, A01 microfiche. Miscellaneous Paper H-76-12, J 1976. 71 p, 29 fig, 3 tab, 37 ref, append.

Descriptors: *Wind velocity, *Great Lakes, E mating, Lakes.

Past efforts to estimate wind speeds over a la lake have met with very limited success. The p pose of this study is to demonstrate that, wit combined theoretical-empirical approach, wi over a lake can be obtained from transform wind speeds at nearby land stations. The theor cal results provide a basis for comparison of m empirical data sets and establish a rational me of analyzing the expected differences betw winds over land and those over a marine surfa This in turn affords a means of examining sy matic variations in the ratio of wind speeds ov lake to wind speeds over land. The good ag ment theory and observation indicates that w estimates over the lake can be made for a w range of synoptic conditions with an rms erro under 5 knots. The theoretical curve for the l wind/land ratio provides a stable estimate of l winds well beyond wind speeds for which ther good empirical data. Consequently, the techni presented here offers relatively good relativ good accuracy even in extreme wind conditi where there are little or no direct measurement winds over the lake. (WES)

THE DISTRIBUTION AND ABUNDANCE OF LARVAL FISHES ALONG THE WESTERN SHORE OF LAKE ERIE AT MONROE, MICHIGAN,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
D. D. Nelson, and R. A. Cole.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 207, Price codes: A04 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University, Technical Report No. MSU-IWR-TR-75-0032.4, October 1975. 66 p, 2 tab, 9 fig, 37 ref.

Descriptors: *Fish, *Freshwater fish, *Thermal powerplant, *Michigan, *Lake Erie, *Cooling waters, *Heated water, Coldwater fish, Fry, *Electric power, Water pollution sources, Yellow perch, Carp, White bass.
Identifiers: Larval fish, Western Lake Erie, Monroe(Mich), Gizzard shad, *Alewife, Freshwater drum.

The distribution and abundance of larval fish in and around the condenser cooling-water system of an electric generating station on western Lake Erie was studied during the summers of 1973 and 1974. Samples were collected with a 1m, number 0 mesh (0.571 mm) plankton net. Analysis of variance and Tukey's post-hoc comparisons were used to analyze differences in numbers of individuals collected. During the study period, 20 species of taxonomic groups were identified although 90% of the total catch was represented by only 4 taxa. Abundances from year to year within these most abundant groups varied greatly, indicating a need for more than short-term studies. (Katz)

INFLUENCE OF SAND IN REDDS ON SURVIVAL AND EMERGENCE OF BROOK TROUT (SALVELINUS FONTINALIS),
Wisconsin Cooperative Fishery Unit, Stevens Point.
D. A. Hausle, and D. W. Coble.
Transactions of American Fisheries Society, Vol. 105, No. 1, p. 57-63, 1976, 3 fig., 4 tab., 26 ref.

Descriptors: *Brook trout, *Reproduction, *Fish eggs, *Hatching, *Immature growth stage, *Fry, *Sands, *Spawning, Environmental effects, *Artificial substrates, Trout, Fish reproduction, Laboratory tests, Life cycles, Dissolved oxygen, Methodology, Mortality, Fish management.
Identifiers: Survival, *Artificial redds.

Alevins of brook trout (Salvelinus fontinalis) were buried in laboratory troughs in spawning gravel containing 0 to 25% sand. Sand slowed emergence and reduced the number of fry emerging. Weight of fry was not related to proportion of sand in the gravel, but was related to time; the fry were heaviest near the time of peak emergence, and lighter before and after the peak. Survival was estimated to be 84% from egg deposition to hatching for brook trout in Lawrence Creek, Wisconsin, and 70% from hatching to emergence, providing a total estimate for survival from egg deposition to emergence of 59%. ANOMALOUS WATER RELATIONS IN COPPER-DEFICIENT WHEAT PLANTS,
Waite Agricultural Research Inst., Glen Osmond (Australia). Dept. of Agronomy.
R. D. Graham.
Australian Journal of Plant Physiology, Vol. 3, No. 2, p 229-236, March, 1976. 2 fig, 3 tab, 17 ref.

Descriptors: *Wheat, *Leaves, *Wilting, *Wilting point, *Water loss, *Moisture availability, Resistance, Copper, Moisture deficit, Water utilization, Water yield, Root systems, Root development, Soil water, Soil moisture, Soil-water-plant relationships, Stomata, Moisture, Moisture content, Drying.
Identifiers: *Copper deficiency(Plants), *Leaf water potential, *Diffusive resistance(Plants).

Wilting is perhaps the most widely observed symptom of copper deficiency in cereals. Experiments were conducted to investigate the way in which copper deficiency affected the water relations of wheat plants, and to test the hypothesis that the low root-shoot ratio of copper deficient plants resulted in low plant water potentials, and thus wilting. Leaf water potential, diffusive resistance, relative water content, weekly water use, yields and head bending were measured on wheat plants subjected to four copper levels and two water levels, and the results presented. Severe copper deficiency resulted in no grain yield, wilting, and increased leaf diffusive resistance. Water supply effects were observed but there was no interaction between copper and water treatments. Mild copper deficiency resulted in small yield decreases. It is concluded that wilting, characteristic of copper-deficient plants, is due to structural weakness and not to the water stress of the plants; also, increased leaf diffusive resistance is due to a specific effect of copper deficiency on guard cells and not to decreased leaf water potential. (Jamail-Arizona)

A COMPARATIVE STUDY OF THE EFFECT OF SOIL MOISTURE ON THE GROWTH AND TRANSPIRATION OF CERTAIN POPLAR FORMS, (IN BULGARIAN),
Forest Research Inst., Sofia (Bulgaria).
T. Naydenova-Yaneva.
Gorsko Stop Nauka. 11(5), p 42-52, 1974.

Descriptors: *Soil moisture, *Transpiration, *Plant growth, *Trees, Soil types, Forest soils, Brown soils, Alluvium.
Identifiers: Poplars, Populus euramericana, Populus weltheimeipappel.

Glasshouse experiments were carried out with 4 poplar forms: Populus euramericana I-214, P. euramericana I-262, P. euramericana I-455 and P. weltheimeipappel on 2 soil types: alluvial and brown forest (dark) at a permanent soil moisture content of 100, 85, 70, 55, 40 and 25% of its maximum water-holding capacity. The amount of water transpired by a single sapling during the experiment, as well as that per gram of increment, was higher if the soil moisture ranged 70-100% of the maximum water-holding capacity, and the least at 40-25%. The optimal moisture content or the moisture content at which the highest increment of a vegetative mass was obtained for the poplar forms varied at 70-85%. If soil moisture was increased or decreased, the increment decreased, being the least at moisture content of 40 and 25%. P. euramericana I-214 and P. weltheimeipappel showed almost similar growth on alluvial soils,

U.S. DEPT. URBANA-CHAMPAIGN

having a moisture content of 100 and 85%; the best growth was that of P. euramericana I-214 at a moisture content ranged 40-55%. On brown forest soils P. euramericana I-262 showed good growth at a range of soil moisture of 40-100%, but at a soil moisture of 25% it had the lowest growth as compared with the other poplar forms.--Copyright 1975, Biological Abstracts, Inc.

THE ECOLOGY OF CADDIS FLIES (TRICHOPTERA) FROM MOUNTAIN STREAMS OF SOUTHERN TIEN-SHAN (EXEMPLIFIED BY THE FAUNA OF THE AK-BURA RIVER), (IN RUSSIAN),
Oshskii Gosudarstvennyi Pedagogicheskii Institut (USSR).
E. O. Omorov.
Entomol Obozr 54(4), p 773-779, 1975.

Descriptors: *Caddis flies, Aquatic insects, Invertebrates, Larvae, *Ecology, Benthic fauna, Rivers, Streams.
Identifiers: Ak-Bura, Apatania-copiosa, Arctopsyche-sp, Dinarthrum-reductum, Himalopsyche-gigantea, Himalopsyche-hoplura, Hydropsyche-gracilis, Hydropsyche-sp, Rhyacophilia-obscura, Rhyacophila-praebranchiata, Tadzhik-Ssr, Tien-Shan, USSR.

Caddis fly larvae and pupae were collected in the Ak-Bura river (the Altai ridge) (Tadzhik SSR, USSR); the list of species is given. The greatest specific variety was observed in the middle and upper current zones. According to the specific composition of caddisflies the zones can be grouped as follows: an upper current zone is characterized by the abundance of Himalopsyche gigantea, H. hoplura larva and Rhyacophila praebranchiata larvae; a middle current zone is characterized by the prevalence of R. obscura, Arctopsyche sp., Dinarthrum reductum, Aptania copiosa, etc.; in the lower current zone the most abundant are Hydropsyche gracilis and Hydropsyche sp.--Copyright 1976, Biological Abstracts, Inc.
W77-02892

AMINO ACID AND FRACTIONAL COMPOSITION OF PROTEIN OF THE VEGETATIVE MASS OF CORN AT DIFFERENT LEVELS OF MINERAL NUTRITION AND WATER SUPPLY, (IN RUSSIAN),
Vsesoyuznyi Nauchno-Issledovatelskii Institut Kormov, Moscow (USSR).
F. V. Voronkova, V. S. Titov, E. S. Vorob'ev, and B. B. Okonskii.
S-Kh Biol 10(6), p 841-848, 1975.

Descriptors: *Amino acids, *Proteins, *Corn(Field), *Nutrients, Water supply, Mineralogy, *Nitrogen.
Identifiers: Albumin, Globulin, Glutelin, Prolamin, Silage.

Sowing dates, water availability and mineral nutrition affect the biological value of crude protein in corn. With acute water deficit the redistribution of N-containing substances between corn stems and leaves affected the utilization of amino acids and the digestibility of nutrients of the silage. In newly-cut corn from unirrigated plots the amount of albumin in stems approached their content in leaves; there were more globulins, proalamins and glutelins in stems than in leaves. The quantitative amino acid composition of protein fractions in corn in irrigated plots was different from that of non-irrigated plots.--Copyright 1976, Biological Abstracts, Inc.

CARBOHYDRATES AND NITROGENEOUS COMPOUNDS IN A NUMBER OF HIGHER AQUATIC PLANTS AND DYNAMICS OF THEIR CONTENT DURING VEGETATION, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
K. B. Yakubovskii, and A. I. Merekhko.
Gidrobiol Zh 11(6), p 81-84, 1975.

Descriptors: *Carbohydrates, *Nitrogen compounds, Aquatic plants, Vegetation, *Proteins, Amino acids.
Identifiers: Alisma-plantago, Butomus-umbellatus, Phragmites-communis, Polygonum-amphibium, Potamogeton-perfoliatus, Scirpus-lacustris, Typha-angustifolia.

Data are presented on the content of nitrogeneous substances (crude protein), carbohydrates and free amino acids in narrowleaf cattail (Typha angustifolia), common reed (Phragmites communis), flowering-rush (Butomus umbellatus), water plantain (Alisma plantago), bulrush (Scirpus lacustris), perfoliate pondweed (Potamogeton perfoliatus) and willow-grass (Polygonum amphibium). The content of carbohydrates and nitrogenous compounds in the plants was variable during vegetation in the individual species. In early Aug. the qualiative and quantiative composition of free amino acids depended on the plant species. In general the content of amino acids was high. Harvesting of these aquatic plants should be done before their flowering, since they have high fodder value at this period.--Copyright 1976, Biological Abstracts, Inc.

CALCULATION OF RATE OF NUTRIENT UPTAKE BY GROWING ROOTS,
National Fertilizer Development Center, Muscle Shoals, Ala.
F. F. Khasawneh
Agronomy Journal, Vol. 67, No. 4, p 574-576, July-August 1975. 21 equ, 7 ref.

Descriptors: *Root development, *Root systems, *Nutrients, *Nutrient removal, *Fertilizers, Mathematical analysis, Crop response.
Identifiers: *Root aging, *Root growth.

Equations are presently available to calculate the rate of nutrient uptake by growing roots. They can be used to estimate an average rate of uptake by the entire root system, but they fail to give specific information on uptake by a unit segment of root or on the effects of aging and morphological changes of such a segment on its capacity for uptake. A theoretical analysis is presented of the process of nutrient uptake by a growing root system. The objective of this analysis is to derive equations that would give such specific information. A frequency distribution function is used to partition root systems into a continuum of age groups, each possessing a rate of uptake that is a function of the age of that group. Equations are derived that utilize time-series measurements of root length and nutrient accumulation in the plant. These derivations are used to calculate parameters of nutrient uptake related to two properties of the root system: (1) the rate of nutrient uptake of a unit segment of root and the manner by which this rate changes with aging and (2) the rate of nutrient flux into the entire root system as a function of time. THE EROSION INDEX AS A FACTOR FOR DETERMINING TURBIDITY IN RIVERS (L'INDICE D'EROSION-FACTEUR DE DETERMINATION DE LA TURBIDITE DES RIVIERES),
R. Papasov.

In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No 113, p 15-20, 1974. 3 fig, 1 tab, 6 ref.

Descriptors: *Turbidity, *Rivers, *Sediment discharge, *Foreign countries, *Streams, Soil classification, Cultivation, Graphical methods, Watersheds(Basins), Rainfall intensity, Erosion, Slopes, Soil physical properties, Vegetation effects, Agriculture, Soil types.
Identifiers: *Stream turbidity, *Bulgaria, Erosion index.

In determining the average annual sediment discharge P kg/s, the average annual stream turbidity rho g/cu m, and the sediment modulus q sub p g/s/sq km, in rivers, the erosion index epsilon kg/s and the soil characteristic X were used. These two factors quantitatively describe the erosion process in catchments and the influence of different soils upon them. The erosion index was defined mainly by the characteristics of the catchment, the rainfall intensity (mm/min), the slope gradient i, vegetation, and the degree to which soil is plowed p. The rainfall intensity plays an important role in determining the erosion index. Different soil types and cultivation also affect the erosion index. The influence on the erosion process of human activity by soil cultivation and exploitation of pasture and woodland is evident and was also considered in the investigation. Empirical formulae were obtained, and nomographs were devised for simple and rapid evaluation of the erosion index, sediment discharge, and turbidity in rivers. (See also W77-02771) (Froehlich-ISWS)

PLANT COVER AND SEDIMENT TRANSPORTATION IN THE RIVER BASIN OF THE SEINE (LA COUVERTURE VEGETALE ET LES DEBITS SOLIDES DES COURS D'EAU DANS LE BASSIN DE LA SEINE),
J. Tixeront.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No. 113, p 28-35, 1974. 1 fig, 4 tab, 12 ref.

Descriptors: *Sediment discharge, *Rivers, *Foreign countries, *Vegetation effects, Watersheds(Basins), Suspended load, Sediment transport, Sediment yield, Forests, Cropland, Arable land, On-site data collections.
Identifiers: *France, *Paris, *Marne River, *Seine River.

The basin of the Seine has been the site of a remarkable evolution of plant cover since the mid-nineteenth century: (1) the forested area or area covered by herbaceous vegetation has increased, and (2) the area of arable land has decreased by about 40%. As the volume of suspended material in the rivers originates essentially from arable land, it could be expected that there would be a decrease in the quantity of suspended material. One can compare the sedimentation measurements performed during the years 1864, 65, and 66 on the Seine and the Marne upstream from Paris with the values observed today. Such a comparison seems to give a significant correlation with the decrease of arable land. The future developments that are likely to happen as a result of current trends are: (1) a cessation of the expansion of forested areas; (2) the return to cultivation of areas in Champagne, France, that had been forested between 1850 and 1950; and (3) the increase in size of the cultivated areas as a result of new trends in land distribution. EROSION PHENOMENA IN DRAINAGE BASINS REFLECTED BY SEDIMENT FLOW IN RIVERS (PHENOMENES D'EROSION DES BASSINS VERSANTS REFLETES PAR LES TRANSPORTS SOLIDES DES COURS D'EAU),
Institutul de Meteorologie si Hidrologie, Bucharest (Rumania).
C. Diaconu.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No 113, p 57-61, 1974. 3 fig, 1 tab, 10 ref.

Descriptors: *Watersheds(Basins), *Sediment yield, *Erosion, *Rivers, Foreign countries, Sediment discharge, Vegetation effects, Sediment load, Sediment distribution, Sediment transport, Sheet erosion, Soil erosion.
Identifiers: *Romania.

The long-term mean values of the sediment discharges, their territorial distribution, the laws of their variation with altitudes, as well as the characteristics of sediment discharges conditioned by the water flow were defined as the main characteristic elements of the sediment flow in rivers which themselves show the state of erosion in a basin. The connection existing between these characteristic elements and the state of erosion in basins was analyzed, emphasizing the great degree of complexity in the reflection of the erosion phenomena in a basin on the sediment movement in rivers through the transition state when the river beds act as temporary deposition sites for sediment in movement from the erosion site on the upland to the ocean. A method of determining the possible maximum values of the specific mean sediment flow on the basis of the state of erosion in basins was given. The growing need for research on methodological aspects of this topic was mentioned. (See also W77-02771) (Humphreys-ISWS)

In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No 113, p 73-77, 1974. 1 fig, 1 tab, 8 ref.

Descriptors: *Erosion, *Watersheds(Basins), *Rural areas, *On-site investigations, *Europe, On-site data collections, Sediment discharge, Land use, Soil erosion, Runoff, Soils, Podzols, Sediment load, Sediment yield.
Identifiers: *USSR.

The principles of research into water erosion were considered; interrelationships between the processes of erosion from the slopes of drainage basins and sediment discharge from river basins were given, both on the basis of general theoretical principles as well as with regard to topography, man's activities, etc. A simplified theoretic model of surface wash from slopes was proposed; the model takes into account the extent and type of the overland flow. Design rules were given, based on morphometric parameters of the stream network. A method for approximately quantifying slope erosion produced by spring snow melting or single storms was given. Data on soil wash resulting from spring snowmelt floods are generalized according to observations made at water balance stations and small watersheds (125 station years) in the areas of accelerated (anthropomorphic) water erosion in the central part of the European territory of the USSR. Graphs and tables were given which characterize the quantity of soil wash from different soil types and different agricultural practices as a function of runoff depth during spring snowmelt floods. USE OF AUTOMATED REMOTE SENSING TECHNIQUES TO DEFINE THE MOVEMENT OF TOW-GENERATED SUSPENDED MATERIAL PLUMES ON THE ILLINOIS AND UPPER MISSISSIPPI RIVERS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
L. E. Link, Jr, and A. N. Williamson, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-025 733, Price codes: A04 in paper copy, A01 in microfiche. Technical Report M-76-6, June 1976. 56 p, 7 fig, 6 tab, 13 plates, 9 ref, append.

Descriptors: *Aerial photography, *Illinois River, *Infrared radiation, *Mississippi River, *Optical properties, *Plumes, *Remote sensing, *Suspended load, *Sedimentation, *Water sampling.

Sequential color-infrared aerial photos and corresponding surface water samples were obtained at selected sites on the Illinois and Upper Mississippi Rivers to examine the movement of tow-generated suspended material plumes. The aerial photos were digitized with a scanning microdensitometer, and optical density values were extracted for correlation with suspended material concentration data obtained by laboratory analysis of the water samples. The poor correlation between optical density and concentration values prevented quantitative definition from the imagery of the distribution of suspended material concentrations at the sites as a function of time. Digital data handling procedures were used to enhance the visibility on the imagery of the tow-generated plumes. The procedures applied were successful in delineating the movement and dissipation of the tow-generated plumes under favorable sun and water conditions. (WES)

Descriptors: *Beaches, *Shores, *Dredging.
Identifiers: *Dredged material, *Beach nourishment.

Results are presented of the first two phases of a research project aimed at developing new dredging systems for beach nourishment from offshore sources. As an introduction to the subject matter, the current situation in the United States regarding beach nourishment and offshore dredging equipment is outlined. Example nourishment projects are described in order to illustrate the types of nourishment projects accomplished and the range of equipment used to date. Next, the engineering considertions involved in selecting an optimum nourishment system for a particular project or project category are presented, and their effects on system characteristics are discussed. The main body of the report presents the results of an investigation into equipment suitable for offshore nourishment work. Approximately 50 examples are described illustrating dredge types, pipelines, connections, and miscellaneous pieces of equipment. The final portion of the report consists of the selection of certain equipment subcategories for further consideration and the construction of possible offshore nourishment systems using this selected quipment. This report presents a summary of hydraulic and sediment-transport data for two series of laboratory studies in a recirculating flume. Sands with median diameters of 0.25 and 1.1 millimeters were used in the studies. Velocities and depths were controlled, and the slopes, bed configurations and sediment-transport rates adjusted to the imposed independent variables. Mean depths were varied from about 0.2 to 0.9 meter and mean velocities ranged from about 0.4 to 2.0 meters per second. (Woodard-USGS)

Descriptors: *Hydrates, *Water chemistry, Oxygen, Hydrogen, Light, Electrochemistry, Thin films, Electrolysis, Hydrogen bonding.
Identifiers: *Water decomposition, *Photocatalyst, Copper oxide, Titanium dioxide, Sunlight, Sputtering.

The objective of the project is to demonstrate that an inexpensive heterogeneous photocatalyst may efficiently decompose water to hydrogen and oxygen with sunlight, specifically focusing on sensitization of known photo catalysts to the sunlight spectrum. In the first quarter of the project, a short circuit photocurrent response in the visible with chromium-doped titanium dioxide in an electrochemical cell has been demonstrated. It was also shown that titanium dioxide could be grown electrochemically in an inexpensive manner. Copper oxide was grown by oxidation of copper and sputtering of copper oxide to make a copper oxide/titanium dioxide heterojunction is being investigated. (Luedtke-Wisconsin)

STORM TIDE FREQUENCY ANALYSIS FOR THE OPEN COAST OF VIRGINIA, MARYLAND, AND DELAWARE,
National Weather Service, Silver Spring, Md. Office of Hydrology.
F. P. Ho, R. J. Tracey, and V. A. Meyers.
NOAA Technical Memorandum NWS HYDRO-32, August 1976. 57 p, 23 fig, 7 tab, 42 ref.

Descriptors: *Hurricanes, *Floods, *Hazards, *Coasts, *Storm water, *Virginia, *Maryland, *Delaware, Climatology, Tides, Sea level, Insurance, Storm surge, Frequency analysis.
Identifiers: Storm tides.

Storm tide height frequency distributions are developed on the coast of Virginia, Maryland and Delaware for the National Flood Insurance Program. Storm tides are computed from a full set of climatologically representative hurricanes using the National Weather Service numerical-dynamic storm surge model. Winter storm effects are estimated from tide gage records. Storm tide levels from all storms are shown in coastal profile between annual frequencies of 0.10 and .002. This report is intended for use in estimating actuarial risk to buildings from coastal floods and in flood plain management. (NOAA)

HYDRODYNAMIC MODEL OF THE GREAT BAY ESTUARINE SYSTEM,
New Hampshire Univ., Durham. Mechanics Research Lab.
B. Celikkol, and R. Reichard.
Sea Grant Program Report No. UNH-SG-153, August 1976. 115 p, 9 fig, 1 tab, 21 ref, 12 append. SG-04-5-158-50 (SGR/CZ-2).

Descriptors: *Estuaries, *Hydrodynamics, *Mathematical models, *New Hampshire, Coasts, Estuarine environment, Model studies.
Identifiers: Bottom friction, Eddy viscosity, *Great Bay estuary(NH).

A numerical hydrodynamic model developed by Connor and Wang has been applied to the Great Bay Estuary system. The model, using the finite element method, was found to be better suited to the complexities of the Great Bay Estuary system than Leendertse's finite difference model. Initial model development has been completed, and qualitatively acceptable results are presented. A numerical experiment was conducted to develop a procedure to be used for selction of critical model parameters in the calibration process. The general scheme for model calibration is presented, and is ready to be implemented, pending receipt of current data collected last summer by the National Ocean Survey. (NOAA)

FORMULAS USED TO ANALYZE WIND-DRIVEN CURRENTS AS FIRST-ORDER AUTOREGRESSIVE PROCESSES,
National Oceanic and Atmospheric Administration, Seattle, Wash. Pacific Marine Environmental Lab.
H. O. Mofield, and D. Mayer.
NOAA Technical Memorandum ERL PMEL-7, August 1976. 24 p, 6 fig, 6 tab, 2 ref.

Descriptors: *Ocean currents, Numerical analysis, *Alaska, *Regression analysis.
Identifiers: Outer Continental Shelf, *Wind driven currents, *Autoregression analysis.

This memorandum justifies formulas used to analyze wind-driven ocean currents as first-order autoregressive processes forced by the wind. A set of numerical experiments with synthetic data shows that the formulas give accurate results with both white and nonwhite noise forcing and with either filtered or non-filtered data. The formulas are a significant improvement over those traditionally used in autoregression analysis based on covariances. (NOAA)

Technical Bulletin No. 19, January 1976. 165 p, 3 maps. PL 88-309, Proj 2-188-R.

Descriptors: *Estuarine environment, Aquatic life, *Baseline studies, Water resources, *Louisiana, *Gulf of Mexico, Lakes, Invertebrates, Zooplankton, Mollusks, Hydrology, Climatology, Sediments.
Identifiers: *Coastal zone, *Lake Pontchartrain(La), *Lake Maurepas(La), Vertebrates.

U. S. DEPT. OF AGRICULTURE
URBANA-CHAMPAIGN

This study was made to investigate the composition, general distribution, and abundance of commercially or potentially important fauna inhabiting the Lake Pontchartrain-Lake Maurepas estuarine complex, so that comparisons with previously completed wetland research in Louisiana and the northern Gulf of Mexico might enable administrators to efficiently manage Louisiana's renewable coastal zone resources. Vertebrate and macroinvertebrate populations were sampled with a 16-foot trawl and a 100-foot beach seine. Mulluscan benthic communities were empirically determined utilizing a Peterson dredge. Zooplankton was estimated based upon collections accomplished utilizing a no. 2 mesh 1.8x0.5 meter net. Hydrological and climatological parameters were collected at four stations in addition to those coinciding with trawl, seine, Peterson, and zooplankton locations. Grain size determinations were made of the upper three inches of sediment samples during two separate sampling efforts--one in 1972 and another in 1973. (NOAA)

Sea Grant Program Report No. 14, August 1976. 55 p, 5 fig, 7 tab, 37 ref. SG-04-3-158-43.

Descriptors: *Florida, *Inlets(Waterways), *Sedimentation, *Sediment transport, Geology, Storms, Dredging, Jetties.
Identifiers: Sebastian Inlet(FL), Morphology.

This report of Sebastian Inlet is one of a 'Glossary of Inlets' series to be prepared under the State University System Sea Grant project, 'Nearshore Circulation, Littoral Drift and the Sand Budget of Florida'. The purpose of this series is to provide for each inlet a summary of the more significant available information and to list known documentation. Sebastian Inlet is a man-made cut connecting the Atlantic Ocean to the Indian River on the east coast of Florida, about 45 miles south of Cape Canaveral. Following a brief note on the geologic setting information is given on its climate and storm history, jetty improvements, dredging, its morphological changes, hydraulics and the sedimentary processes. DELAWARE'S CHANGING SHORELINE,
Delaware Univ., Newark. Dept. of Geology.
J. C. Kraft, E. A. Allen, D. F. Belknap, C. J. John, and E. M. Maurmeyer.
Delaware Coastal Zone Management Program, Technical Report No. 1, May 1976. 330 p, 177 fig, 2 append.

Descriptors: *Delaware, *Coasts, *Geology, *Sediment transport, *Shore protection, *Subsidence, *Sea level, Beaches, Geomorphology
Identifiers: *Coastal zone, *Shoreline changes, Shorelines, Eustacy.

The coastal zone of Delaware, including both the coasts of Delaware Bay and the Atlantic shoreline, is categorized as a lagoon-barrier-marsh shoreline. This coastal zone is presently undergoing a relatively rapid transgression by the Atlantic Ocean. This transgression is an effect of coastal erosion caused by the action of waves and high tidal waters. However, in addition longer term geologic factors such as coastal subsidence and sinking of the continental margin apply. Another aspect is that of eustatic, or actual, rise in the level of the world's oceans. A combination of these factors leads to a pervasive erosion and gradual rise of the Atlantic Ocean relative to Delaware's land area. The report details some of the geological processes and summarizes present knowledge of the geology of the area, its sedimentary environments, rates of change and active processes, and presents some predictions of expected change. Consideration of these factors by planners, coastal managers and coastal residents will lead to much less friction in the future regarding unwarranted expenditures of public funds in a manner effective only over the short term, five or ten year period.(NOAA)

COASTAL ZONE BOUNDARIES.
Delaware State Planning Office, Dover. Coastal Zone Management Program - Public Involvement. Working Paper No. 2, September 1976. 35 p. 13 fig, 1 tab.

Descriptors: *Delaware, *Management, *Coasts, *Wetland, *Salt marshes, Boundaries(Surfaces), Maps, Tidal marshes, Beaches, *Coastal marshes.
Identifiers: *Coastal zone management, *Uplands, Coastal waters, Territorial sea.

This is the second in a series of working papers which will be issued to interested citizens and governmental officials so that they may actively and effectively participate in the development of Delaware's Coastal Zone Management Program. Regulations implementing the Federal Coastal Zone Management Act specify that the management program show evidence that the State i developed and applied a procedure for identify the boundary of the coastal zone. Necessary ments of this identification process are include this working paper. The final Coastal Z Management Program for Delaware will ref both regulatory applications due to the coa relationship of the entire State. Therefore, the tire State is recommended for inclusion in management program. This area will be the b for broad program management purposes, prim ly coordination, information systems, and b standards development. This boundary refle many of the biophysical concerns, especially drainage basin/watersheds factors, as well as m ing use of the established intitutional structure fered by a coastal counties approach. IARYLAND UPLANDS NATURAL AREAS TUDY. VOL I: EASTERN SHORE,
ogers and Golden, Inc., Philadelphia, Pa.
Rogers, S. Syz, and F. Golden.
eport to Maryland Department of Natural esources Coastal Zone Management Program, 976). 104 p, 18 fig, 5 tab, append.

escriptors: *Land use, *Natural resources, Water table, *Coasts, *Maryland, *Wetlands, ssessments, Wildlife, Recreation, Forestry, isheries, Runoff, Soils, Vegetation.
lentifiers: *Coastal zone management, *Aquatic uffer zones, *Uplands, Environmental assess-ents, Coastal aquatic environments.

he Maryland Uplands Natural Areas Study olume I describes the scope, objectives and ethodologies of the natural areas inventory of laryland's coastal zone. The data parameters sed in the inventory as well as the potential users nd the uses of the data are discussed. A special ffort was made to describe in detail the processes nd considerations relating to aquatic buffer ones. It is through the hydrologic processes that pland natural areas are most directly related to oastal aquatic environments. The discussion of uffer zones in this volume provides detail neces-ary to understand the natural processes in these ones and to allow delineation of aquatic buffer ones. Included is a discussion of the rationale be-ind the choice of parameters inventoried and the echniques used in the natural areas inventory. A iscussion of how areas might be evaluated for pecified uses or relative quality is also part of this olume. (See also W77-02691) (NOAA)

he report is organized into three sections. First, e study area is described in terms of its geology, hysiography, and vegetation communities. epresentative cross sections of the different egetation communities are included. This is fol-wed by a brief overview of the site selection rocess, the data management system and the arameters and potential uses that were sampled. he remaining portion of the report covers the tailed encoding instruction for filling out the eld data forms. These instructions are organized data card as shown on the sample field data rm. The Field Notebook incorporated in this olume represents the methodology developed by e Coastal Zone Management Program for sam-ing upland natural areas on Maryland's Eastern ore. The notebook contains a description of the tural history of the shore as well as a description the methods and techniques for data collection. is intended to serve as a manual for organiza-ns or individuals who may be interested in car-ing out field surveys of upland sites on the East-n Shore. WAVE PROPAGATION DURING THE GHANA UPWELLING,
Ghana Univ., Legon. Dept. of Physics.
R. W. Houghton, and T. Beer.
Journal of Geophysical Research, Vol. 81, No. 24, p 4423-4429, August 20, 1976. 9 fig, 1 tab, 9 ref.

Descriptors: *Ocean waves, *Upwelling, *Atlantic Ocean, *Africa, Waves(Water), Internal waves, On-site investigations, Continental shelf, Temperature, Water temperature, Salinity, Foreign countries, Currents(Water), Ocean currents, Correlation analysis, Coasts, Oceanography.
Identifiers: *Kelvin waves, *Ghana.

During the coastal upwelling in 1974, the ocean temperature along the coast of Ghana exhibited periodic variations at a frequency of 0.07 cpd which propagated westward along the coast. Equatorial, shelf, and Kelvin waves were discussed in this paper, and it was stated that the 1974 wave could be described in terms of any of these types of waves. However, it was concluded that in the light of current theories of energy exchange in coastal waves, the 1974 oscillation most likely was an internal Kelvin wave. (Sims-ISWS)

THE CAPACITY OF SALT MARSH VEGETATION TO MODIFY THE QUALITY OF ESTUARINE WATERS,
Rhode Island Univ., Kingston. Dept. of Plant and Soil Science.
R. J. Hull.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-261 997, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, September 30, 1976. 34 p, 6 fig, 10 tab, 6 ref. OWRT B-062-RI(1). 14-31-0001-4173.

Descriptors: Nitrogen, Phosphorus, Cadmium, Zinc, *Absorption, Eutrophication, Ions, *Heavy metals, *Nutrients, *Salt marshes, *Marsh plants, Estuaries, Estuarine environment, *Pollutant identification, Sediments, Tide waters, Water quality, Water pollution.
Identifiers: Spartina alterniflora, Spartina patens, Marsh grasses, *Salt water cordgrass.

The ability of tidal marsh vegetation to absorb nutrient and heavy metal ions introduced to the marsh by tidal flood waters was investigated. Water soluble salts of N, P, Cd, and Zn were ap-

U. S. DEPT. OF AGRICULTURE
URBANA-CHAMPAIGN

plied to the marsh surface during low tide, and infiltration into the sediment was measured by analyzing water samples taken from wells placed 15, 30, 60 and 90 cm into the sediment. Ammonium, applied as urea, and phosphate penetrated the marsh sediment readily with most concentrated in the upper 15 to 30 cm. Spartina alterniflora growing on the marsh absorbed approximately 40% of the NH4+ and 20% of the P applied. S. alterniflora and S. patens absorbed NH4+ preferentially from solutions containing 10 to 15% NaCl. S. patens absorbed NH4+ at normal rates regardless of the solution oxygen tension. Cd and Zn applied to the marsh surface was not detected in sediment water and plant uptake was less than 1% of that applied. Radio Cd and Zn was absorbed from nutrient solution by S. alterniflora and moved via symplast and apoplast throughout the plant. Nutrient sink properties of tidal marshes are confirmed.

Descriptors: *Littoral drift, *Sediment transport, Sand waves, *Sands.

The purpose of this program was to investigate and develop a practical method for the management of sand influenced by littoral transport. The work covered laboratory research, field investigations, and tests. Initially, laboratory investigations of jet pumps, crater-sinks, and fluidization were conducted utilizing specially designed apparatus. During the laboratory investigations a new principle of fluidization was developed. This new form of fluidization is called 'duct-flow' fluidization. Field tests of craters dredged on the ocean floor showed that wave action causes the crater to elongate in a direction parallel to the wave crests. Later, the jet pump and fluidization apparatus were operated individually in the field. Finally, a prototype field sand bypassing system consisting of a fluidizer intercepting littoral drift on a sand spit was used to feed a crater. Sand was removed by a jet pump and deposited on shore 89 meters away. Aerial photographs were taken, and beach profiles, crater, and fluidized trench were measured throughout the field tests. The field tests demonstrated that the prototype system effectively intercepted littoral drift. (WES)

REPRODUCTION OF WHITE PERCH IN THE LOWER HUDSON RIVER,
New York Power Pool, Schnectady, N. Y. Environmental Affairs Office.
J. G. Holsapple, and L. E. Foster.
New York Fish and Game Journal, Vol. 22, No. 2, July 1975, p 122-127, 6 tab, 5 ref.

Descriptors: *Baseline studies, *Reproduction, *Fish reproduction, *Hudson River, *White perch, Spawning, Temperature, Salinity, Estuaries, Water temperature, Water pollution effects.

Baseline information is presented on the reproductive potential of the white perch population of the Hudson River estuary, as derived from data collected between river miles 40 and 60 in 1972. The estimated average number of eggs spawned by 3-year-old fish was 20,676 and for 9-year-old fish was 135,389. Field observation indicated that the peak of white perch spawning occurred in June when water temperatures were 18C to 20C and salinity remained below 1.0 ppt. (Chilton-ORNL)

Desalination, Vol. 17, No. 1, p 17-30, August, 1975. 13 fig, 14 ref.

Descriptors: *Solar distillation, *Solar stills, *Desalination, *Desalination apparatus, Distillation, Water treatment, Desalination plants, Impaired water quality, Potable water, Saline water, Saline water systems, Water supply, Water purification, Desalination processes, Arid lands, Filtration, Water sources, Salinity, Salts.
Identifiers: *Chile.

Solar distillation in Chile is described. A historical overview of this process and a discussion of the apparatus used are given. 'Natural distillation' caused by coastal fog is explained and its various uses evaluated. The two types of direct distillation solar equipment: stills with an evaporation wick and basin-type stills, as well as indirect solar distillation, are considered. Conclusions are presented regarding the application of these processes in the arid regions of northern Chile. The cultivation of plants carried out under plastic tents and use of desalinated water are also discussed. (Jamail-Arizona)

3B. Water Yield Improvement

LABORATORY EVALUATION OF WAX AND SILICONE FOR WATER HARVESTING ON COAL MINE SPOIL,
Rocky Mountain Forest and Range Experiment Station, Fort Collins, Colo.
D. G. Scholl.
Research Note RM-267, 4 p, August, 1976. 3 fig, 4 ref.

Descriptors: *Water harvesting, *Coal mine wastes, *Spoil banks, Runoff, Water yield improvement, *New Mexico, Reclamation, Revegetation.
Identifiers: *Waxes, *Silicones.

New Mexico coal mine spoil treated with either silicone or wax developed water-repellent crusts; the wax crust withstood disturbance better and retained more repellency. Increasing the application rate generally improved performance of both crusts. Both treatments appear suitable for harvesting water to aid plant establishment on coal mine spoil. (Witt-IPC)

Universidad Catolica de Chile, Santiago. Laboratorio de Botanica; and Universidad Catolica de Chile, Santiago. Inst. of Biological Sciences.
F. Riveros.
Flora, Vol. 165, No. 3, p 223-234, 1976. 8 fig, 3 tab, 19 ref.

Descriptors: *Consumptive use, *Moisture stress, *Water balance, *Soil moisture, Arid lands, Droughts, Transpiration, Rainfall, Xylem, Precipitation(Atmospheric), Soil-water-plant relationships, Plant morphology, Plant physiology, Leaves, Stomata, Root systems, *Shrubs.
Identifiers: *Cryptocarya alba, *Quillaja saponaria, Chile.

Of two evergreen woody species of Chilean mediterranean shrub, Cryptocarya alba is confined to more humid sites, while Quillaja saponaria grows also abundantly on sunny arid slopes. Morphological and functional aspects are analyzed in order to understand the mechanisms that allow these plants to grow under semiarid climatic conditions. In regions with mediterranean climates the soil profiles are moistened by winter and spring rainfall. At the beginning of summer the soil dries out, starting from the surface. At the beginning of the drought period stomatal control reduces the loss of water. Q. saponaria, due to its deeper root system, gets to the deeper soil profile layers which retain moisture even during the summer. For this reason the water balance is maintained without significant fluctuations throughout the year. The findings contribute to an understanding of why C. alba is confined to areas of higher moisture, while Q. saponaria is able to grow in places of much greater aridity. (Jamail-Arizona)
W77-02858

CONSERVING WATER BY ANTITRANSPIRANT TREATMENT OF PHREATOPHYTES,
California Univ., Davis. Water Science and Engineering Section.
D. C. Davenport, P. E. Martin, E. B. Roberts, and R. M. Hagan.
Water Resources Research, Vol. 12, No. 5, p 985-990, October, 1976. 6 fig, 9 tab, 32 ref.

Descriptors: *Antitranspirants, *Phreatophytes, *Application methods, *Water conservation, Transpiration control, Transpiration, Water yield improvement, Foliar, Foliar application, Canopy, Cottonwoods, Spraying, Hydrology, Watersheds(Basins), Stomata.
Identifiers: Salt cedar, Willow.

The use of antitranspirants in hydrology seeks to curtail transpiration from forested watersheds and riparian vegetation, such as salt cedar, without removing the vegetation or damaging the ecological balance. There are two main groups of antitranspirants: (1) stomatal inhibitors, which prevent the stomatal pore from opening fully, and (2) film-forming materials, which externally cover or plug stomatal pores. Basic information is provided on foliar coverage of three phreatophytes (salt cedar, willow, and cottonwood) by a wax-based film-forming antitranspirant and the effects of this coverage on transpiration, diffusive resistance, and water potential. Antitranspirants were applied by hand sprayer or backpack mist blower. Transpiration was measured by periodic weighing of potted plants and by gas hygrometer Resistance to water vapor diffusion from the foliage was measured by a porometer and plant water potential by a pressure chamber. The results are presented. Foliar application by hand sprayer or backpack mist blower of a wax-based antitranspirant increased resistance to water vapor diffusion from phreatophyte foliage and decreased transpiration, indicating the potential of this nondestructive approach to water conservation (Jamail-Arizona)
W77-02863

AERIAL SPRAYING OF PHREATOPHYTES WITH ANTITRANSPIRANT,
California Univ., Davis. Water Science and Engineering Section.
D. C. Davenport, P. E. Martin, and R. M. Hagan.
Water Resources Research, Vol 12, No 5, p 991-996, October, 1976. 6 fig, 6 tab, 7 ref.

Descriptors: *Antitranspirants, *Spraying, *Phreatophytes, *Application methods, Consumptive use, Streamflow, Groundwater, Groundwater basins, Water conservation, Water yield improvement, Transpiration, Transpiration control, Chemcontrol, Cottonwoods, Canopy, Foliar, Foliar application.
Identifiers: Salt cedar, Willow, *Aerial spraying.

The use of antitranspirants for water conservation by reducing phreatophyte transpiration is discussed. Experiments were conducted to determine whether aerial spraying of a wax-based antitranspirant emulsion would provide adequate spray coverage and reduce transpiration. Multiple passes were made with (1) a fixed wing plane on salt cedar, cottonwood, and willow and (2) a helicopter on salt cedar. Spray coverage was also conducted on the ground. Scanning electron microscope photomicrographs showed considerable antitranspirant on foilage in the upper canopy and lesser amounts in the lower; the film was detected even 24 days after spraying. Aerially applied antitranspirant increased resistance to leaf water vapor diffusion by 150 percent during the first few days and by 80 percent thereafter. Results then show that (1) good coverage can be achieved by multiple passes of the aircraft and deep antitranspirant spray penetration into dense canopies is not as important as coverage of the outer foilage and (2) transpiration rates can be retarded without foliar damage. However, full assessment of the antitranspirant spraying must await more extensive field trials. (Jamail-Arizona)

COLORADO RIVER BASIN PILOT PROJECT, COMPREHENSIVE EVALUATION REPORT, FIVE WINTER SEASONS 1970-71 TO 1974-75,
Aerometric Research Inc., Goleta, Calif.
R. D. Elliott, R. W. Shaffer, A. Court, and J. F. Hannaford
Prepared for Bureau of Reclamation, Denver, Colorado, Div. of Atmospheric Water Resources Management. Report ARI-76-1, October 1976. 641 p, 72 fig, 47 tab, 53 ref, 4 append. Bur Reclaim Contract 14-06-D-7332.

Descriptors: Atmosphere, Clouds, Meteorology, *Nucleation, Orography, Precipitation(Atmospheric), River basins, Runoff, Silver iodide, Snow, Snowpacks, *Weather modification, *Colorado River Basin, Wind velocity, Meteorological data.
Identifiers: San Juan Mountains(Colo), *Nucleant dispersion.

The primary objectives of this evaluation have been to (1) test the physical concepts of weather modification potential, and (2) test the practical weather modification potential for an operations program, as carried out in the Colorado River Basin Pilot Project during the five winters of 1970-71 through 1974-75. The first objective is approached through an investigation of nucleant dispersion based on wind flow, an analysis of precipitation and rawinsonde data that is essentially diagnostic in character, and an analysis of surface runoff related to precipitation. The second objective is carried out through detailed analyses of precipitation and other records for all five years of the pilot project operation. Conclusions and recommendations are presented which can serve as guidance material for planning orographic research projects. (Bur Reclam)

SOIL WATER EXTRACTION BY ALFALFA,
North Dakota State Univ., Fargo. Dept. of Soils.
L. J. Brun, and B. K. Worcester.
Agronomy Journal, Vol. 67, No. 4, p 586-589, July-August 1975. 3 fig, 2 tab, 9 ref.

Descriptors: *Saline soils, *Salinity, *Alfalfa, Crop response, Crop production, *Soil water, Moisture tension, North Dakota, Montana.

Saline seeps have developed because of the accumulation of water beyond the rooting zone of annual crops. The purpose of this experiment was to show the potential of alfalfa to extract soil water under a variety of textural and salinity conditions. Core samples were taken in alfalfa fields and fields under crop-fallow management to evaluate their present water content, 15 atm. percentage, texture, and salinity level. Significant extraction of soil water occurs to depths of 3 to 4 m. Alfalfa extracted soil water held at a tension greater than 15 atm. in both saline and non-saline segments of the soil profile. A minimum soil moisture level was reached at the 1.22 to 2.44 m depth in alfalfa fields maintained 5 years. Alfalfa is an invaluable crop for reducing soil wetness to alleviate the saline-seep problems of western North Dakota and eastern Montana. (Skogerboe-Colo St)
W77-03064

MINIMAL LEACHING WITH VARYING ROOT DEPTHS OF ALFALFA,
Agricultural Research Service, Riverside, Calif. Salinity Lab.
L. Bernstein, L. E. Francois, and R. A. Clark.
Soil Science Society of America Proceedings, Vol 39, No. 1, p 112-115 January-February 1975. 3 fig, 2 tab, 5 ref.

Descriptors: *Leaching, *Alfalfa, Salinity, Lysimeters, Return flow, Saline water, Crop response, Salt tolerance, *Root development.

Alfalfa was grown in greenhouse lysimeters with soil depths of 60, 120, and 180 cm to determine whether rooting depth affected tolerance to the low leaching percentage of 6.25. Salinities of the drainage waters averaged about 6 mmho/cm for the controls irrigated with 0.4 mmho/cm water, and 26 mmho/cm for lysimeters irrigated with 2.0 mmho/cm water. Steady-state salinity profiles were maintained for 3 years. Yields with the more saline water averaged 23% less than those of the controls, in good agreement with previous findings, but were not significantly affected by lysimeter depth. Water requirements and uptake of chloride and sodium were only slightly affected by lysimeter depth. Salinity profiles with maximum salinities of 26 mmho/cm in the soil water can, therefore, be compressed into a little as a 60-cm depth with no greater effects on yield or salt uptake by the crop than those obtained with salinity profiles extended over 120 or 180 cm. (Skogerboe-Colo St)
W77-03066

COMBINED EFFECTS OF LOW OXYGEN AND SALINITY ON GERMINATION OF A SEMI-DWARF MEXICAN WHEAT,
Escuela Nacional de Agricultura, Chapingo (Mexico). Colegio de Postgraduados.
A. Aceves-N, L. H. Stolzy, and G. R. Mehuys.
Agronomy Journal Vol. 67, No. 4, p 530-532, July-August, 1975. 4 fig, 1 tab, 7 ref.

Descriptors: *Oxygen, *Oxygen requirements, Wheat, Crop response, Salinity, Soil salinity, Germination, Seeds.
Identifiers: *Soil aeration, Mexican wheat(Semi-dwarf).

The simultaneous occurrence of low oxygen and high salinity conditions is common in a wide range of irrigated soils. The combined effects of 02 and osmotic potential stresses on germination of wheat were tested under growth chamber conditions. A range of 02 concentrations and salinity levels were chosen to simulate soil aeration and salinity combinations that might be expected to occur in well-aerated, fine-textured, saline, and saline-sodic soils. Daily observations of number of seeds germinated and days to first germination were recorded. (Skogerboe-Colo St)

WATER RESOURCE MANAGEMENT IN THE CZECHOSLOVAKIAN PAPER INDUSTRY DURING THE FIFTH FIVE-YEAR PLAN PERIOD (VODNI HOSPODARSTVI PAPIRENSKEHO PRUMYSLU CSR V PATE PETILETCE),
F. Nemec.
Papir a Celuloza, Vol. 31, No. 6, p 130-131, 1976. 2 tab.

Descriptors: *Pulp and paper industry, *Water conservation, Fresh water, Water pollution sources, Foreign countries, Europe, Dissolved solids, Water pollution control, Water pollution treatment, Water management(Applied), Effluents.
Identifiers: *Czechoslovakia, Sulfite mills, Kraft mills, Fiber recovery.

During the 1971-1975 period, the fresh water consumption and the fiber loss in the Czechoslovakian paper industry increased by 9.5% and 16.5%, respectively, while the total industry output increased by 31.2%. This relative improvement was achieved by the combination of in-plant water conservation measures and improved primary effluent treatment. The discharge of dissolved solids was reduced by closing several small sulfite pulp mills and replacing their capacity with a new modern kraft mill in Steti, equipped with a complete primary and secondary effluent treatment system. (Trubacek-IPC)

POSSIBILITY OF INTRODUCING WASTE-FREE TECHNOLOGY IN THE PULP AND PAPER INDUSTRY (VOZMOZHNOSTI VNEDRENIYA BEZOTKHODNOI TEKHNOLOGII V OTRASLI),
A. Ya. Tipisev, Ya. V. Nikitin, and N. K. Grigor'eva.
Bumazhnaya Promyshlennost, No 5, p 15-17, May, 1976.

Descriptors: *Pulp and paper industry, *Water pollution control, Effluents, Water conservation, Water reuse, Recycling, Solid wastes, Sludge, Fertilizers, Feeds, Additives, Incineration, Wastes, Waste disposal, Industrial wastes, Pulp wastes, Chlorine, Ammonia.
Identifiers: *Soviet Union(USSR), Pulp bleaching, Chlorine dioxide, Closed systems.

The concept of waste-free technology, as defined by the Commission on Economics of the European Common Market, is discussed, and measures already introduced towards this goal at Russian mills are indicated. Measures aimed at reducing the consumption of fresh water include dry barking, diffusion washing of pulp (in digesters or in separate diffusors), screening and beating at high consistency, manufacture of paper by the dry process, and purification and recycling of fiber-containing effluents. The Selenga pulp and board mill, located near Lake Baikal (USSR), is to be converted soon to entirely effluent-free operation, and will reduce its water consumption to 14-19 cu m/ton of product. The problem of solid wastes utilization is far from being solved. Research aimed at such utilization includes experiments on the utilization of effluent sediments as fertilizers and animal feed additives, on the recovery and utilization of gaseous by-products, and on new methods of pulping and pulp bleaching. Worth mentioning are studies on pulp bleaching with gaseous agents (such as chlorine, chlorine dioxide, ammonia) and the introduction of a fluidized-bed process for combustion of effluent sediments at the Svetogorsk and Kotlas mills. Descriptors: Irrigation, *Grasses, *Irrigation water, Water wastes, Seasonal, *Crop production, *Water utilization, Irrigated land, Pastures.
Identifiers: *Production efficiency(Irrigation water).

From 1973 to 1975 seasonal and peak water use by eight grasses were determined under irrigated pasture conditions while being grazed by yearling steers during spring and summer and weaned calves in the fall. Weather parameters of air temperature, relative humidity, wind and radiation were measured to determine their relationship to water use by these cool-season grasses. Total water use among grasses was not significantly different, but yearly differences occurred with average water use of 43.16 inches in 1974 and 37.50 inches in 1975. The periods of peak water use were July 22-29, 1974 (0.46 inches per day) and June 16-24, 1975 (0.31 inches per day). Water use rates were correlated with evaporation (r = .63), mean daily temperature (r = .54), and maximum temperature (r = .53) for season-long measurements, mean wind (r = .58) for June, and maximum wind (r = .62) for July. In regression analysis, evaporation, years, mean relative humidity and mean wind were major sources of variance for season-long water use. Production efficiency of irrigation water applied is ultimately expressed in the efficiency of animal gain per unit of water applied. Animal weight gain per acre-inch of irrigation water applied. was: intermediate wheatgrass 39.14; orchard-grass 32.99; Garrison creeping foxtail 32.29; meadow bromegrass 32.00; smooth bromegrass 31.27; Reed canarygrass 26.49; Russian wildrye 25.06; and tall fescue 18.65.

Identifiers: *Trickle irrigation.

Trickle irrigation is becoming increasingly important in modern agriculture, but the simultaneous distribution of water and nutrients emerging from a trickle source has been insufficiently studied. This paper reports a laboratory study of simultaneous distributions of water, NO3-N and P in clay and sandy soils irrigated daily from a trickle source. Hydraulic conductivity data, water retention curves and absorption isotherms to the soils were determined to enable verification of mathematical models against the experimental results obtained under various conditions. Adding identical amounts of water but increasing the trickle discharge rate in the sandy soil from 250 to 2,500 milliliters per hour increased the vertical movement of the wetting front and decreased horizontal movement. In a sequence of three cycles of irrigation with a nutrient solution, losses of nitrate were observed in the clay soil, probably due to denitrification processes. The restricted mobility of the

osphate ions, even in the sandy soil, implies that preirrigation mixing of P in the soil, supplented by its addition to the irrigation solution, is cessary to obtain a uniform P concentration in e soil volume. (Jamail-Arizona)

entifiers: *Irrigation schedules, Winter wheat, n evaporation ratio.

ater use efficiency is improved by irrigation of nter wheat (Triticum aestivum) using a ratio of me fixed amount of irrigation water (IW) to pan aporation, PAN-E, (cumulative evaporation om U.S. Weather Bureau class A pan less rain ce previous irrigation) and scheduling according growth stages. In a 2-year field study, IW/PAN-ratios of 0.75 and 0.9 for scheduling irrigation to nter wheat irrespective of growth stage were mpared with a combination of IW/PAN-E with owth stages and the conventional technique of igating at five growth stages. The 0.75 ratio irspective of growth stage produced as large a in yield as irrigation at five growth stages while ng an average of 12 cm less irrigation. Combin-IW/PAN-E with growth stages did not improve yield. The major advantage of this approach is t the farmer need not change the amount of ter from one application to the next. With rain interval for the next irrigation would increase. hns-Arizona)

AUTOMATED CONTROL OF TRICKLE IRRIGATION IN CITRUS,
Arizona Univ., Tucson. Dept. of Soils, Water, and Engineering.
J. D. Busman.
Master of Science Thesis, 1976. 82 p, 6 fig, 2 tab, 13 ref, 3 append.

Descriptors: *Irrigation systems, *Irrigation practices, *Irrigation efficiency, *Irrigation effects, *Citrus fruits, Oranges, Irrigation, Consumptive use, Agriculture, Fruit crops, Soil moisture, Moisture tension, Evaporation pans, Nuclear moisture meters, Irrigation water, Tensiometers, Arizona, Mathematical models.
Identifiers: *Automatic control, *Trickle irrigation.

In recent years the level of interest in trickle irrigation has increased significantly and much work has been done in the design of trickle systems for use in citrus irrigation. This study evaluates an automatic control system, constructed using digital logic, designed to regulate trickle irrigation. The system used an instrumented evaporation pan and an instrumented tensiometer as inputs to a controller. Evaporation from the pan was used to make an estimate of consumptive use of the citrus trees. When soil moisture tension was at the desired level, the controller would allow flow through the trickle system to satisfy this estimate. Soil moisture tensions above or below the desired level would result in irrigation above or below the consumptive use estimate respectively. The operation of the control system was tested in a plot of Valencia orange trees near Tacna, Arizona. The theory involved, the system design and construction, and its operation are evaluated. The data available show that the control system does perform as designed. (Jamail-Arizona)

TRICKLE-DRIP IRRIGATION: PRINCIPLES AND APPLICATION TO WATER MANAGEMENT IN TROPICAL SOILS,
Cornell Univ., Ithaca, N.Y. Dept. of Agronomy.
E. Bresler.
Agronomy Mimeo 75-14, July 1975. 81 p, 17 fig, 3 tab, 34 ref, append.

Descriptors: *Irrigation systems, *Water management(Applied), *Surface irrigation, *Irrigation efficiency, *Irrigation practices, Irrigation, Tropical regions, Crop production, Mathematical models, Salinity, Clogging, Soil water, Infiltration, Irrigation water, Agriculture, Irrigation design, Soil surfaces.
Identifiers: *Trickle-drip irrigation.

The use of trickling or dripping as a method of irrigating large fields has become quite common practice in agricultural production all over the world. The general principles of trickle irrigation are presented, its advantages and disadvantages evaluated, and its application to tropical soils discussed. The surface approach, as opposed to underground trickling (subsurface irrigation) was initiated in Israel and has been widely used for the past few years. This system with its high irrigation frequency increases crop yield, minimizes the salinity hazard to plants, allows continuous application of fertilizers and saves water. These advantages among others are discussed in detail. Some problems concerning the practical use of the method still exist. Operational difficulties of the trickling method may sometimes arise from the clogging of the drippers. Additional problems occur in arid regions where saline water must be used in that there is a tendency for salt to accumulate close to the wetted zone. A mathematical model is employed. (Jamail-Arizona)

CROP PRODUCTION IN THE ARID ZONE WITH SPECIAL REFERENCE TO WESTERN RAJASTHAN,
Central Arid Zone Research Inst., Jodhpur (India).
H. S. Mann, and R. P. Singh.
Annals of Arid Zone, Vol 14, No 4, p 347-357, December, 1975. 9 tab.

Descriptors: *Crop production, *Agronomic crops, *Irrigation canals, *Arid lands, Oilseed crops, Rice, Fertilizers, Irrigation, Planting management, Agriculture, Crops, Wells, Water sources, Land use, Irrigation water, Water conveyance, Soil management, Land management.
Identifiers: Rajasthan, *India.

The arid regions of India comprise a sizeable portion of the total geographical area of the country and contain concentrations of population. Agriculture in these arid regions is considered a necessary, but risky, undertaking. The crop production potentialities of arid lands in the state of Rajasthan are examined, and the types of crops under cultivation are discussed. Rice is one of the major crops of the state, much of it coming from the arid zones, oilseeds are a second major crop grown in the arid regions. Irrigation plays a vital role in the state's agricultural production. In Rajasthan, wells are the major source of irrigation water, followed by canals and tanks. With the completion of the Rajasthan Canal Project in the near future, the contributions of the arid regions will be significantly increased. The use of fertilizers in the area is also discussed. Enormous potential exists for the arid lands of Rajasthan and can be best exploited through proper soil and crop management. (Jamail-Arizona)

THE PRODUCTIVENESS OF LOESS SOILS OF DIFFERENT DEGREES OF EROSION, (IN GERMAN),
Giessen Univ. (West Germany).
T. Harrach.
Land-Wirtsch Forsch 28(3), p 190-199, 1975.

Descriptors: *Loess, *Crop production, *Crop response, *Nutrient requirements, *Soil-water-plant relationships, *Gray-brown podzolic soils, Soil erosion, Water requirements, Land use, Cultivated lands, Soil groups, Soil types, Podzols.
Identifiers: West Germany, Hesse, Pararendzinas, Kolluvisols.

In the loess areas of Hesse (West Germany) the cropyield on Gray Brown Podzolic soils, Pararendzinas and Kolluvisols is characterized by great deviation but there were no definite differences among 4 soils examined. The potential productivity of all 4 soils is very high. A great number of the eroded loess soils - especially Pararendzinas - are so poor in nutrients that the plants show excessively high consumption of water and low yield. Other reasons for the deviations in crop yield on similar soils are the land use system and the climate. The physical and biological condition of the cultivated soil seems to determine crop yield, especially of the Gray Brown Podzolic soil and partly of the Kolluvisols. The valuation of loess soils of different degrees of erosion in the 'Reichsbodenschatzung' (German Valuation of Soils) is also discussed and the importance of soil conservation is pointed out.--Copyright 1976, Biological Abstracts, Inc.

METABOLISM OF PROTEIN AND NUCLEIC ACIDS DURING ADAPTATION TO VARIOUS TYPES OF DROUGHT, (IN RUSSIAN),
Vsesoyuznyi Institut Rastenievodstva, Leningrad (USSR).
N. N. Kozhushko, and G. V. Udovenko.

U. OF I. URBANA-CHAMPAIGN

Fiziol Rast (Mosc) 22(6), p 1239-1244, 1975.

Descriptors: *Droughts, *Metabolism, *Drought tolerance, *Proteins, *Wheat, *Drought resistance, Fertilization.
Identifiers: *Nucleic-Acids.

The content of nucleic acids and protein in the leaves of wheat characterized drought resistance of the variety only in the course of restoration of the normal state of plants after drought and when there were favorable conditions for the adaptation of plants to drought. The degree of disturbance of the reproductive process under the conditions of drought, which was manifested as incompletely fertilized ear, supposedly depended on the degree of deviation of the dynamic equilibrium and metabolism from the normal state rather than on a degree in the content of nucleic acids and protein.--Copyright 1976, Biological Abstracts, Inc.

ANNUAL DYNAMICS OF SOLUBLE SALTS IN THE SOILS OF AN IRRIGATED FIELD WITH BOTH DEEP CLOSED AND OPEN DRAINAGE AT THE BAGAEVSKO-SADKOVSKAYA IRRIGATION SYSTEM, (IN RUSSIAN),
Moscow State Univ. (USSR). General Soil Sciences.
E. G. Morgun.
Vestn Mosk Univ. Ser VI Biol Pochvoved 30(4), p 102-105, 1975.

Descriptors: *Irrigation systems, *Annual, *Salts, *Soils, Drainage.
Identifiers: USSR, Bagaevsko-sadkovskaya(USSR).

Water and salt regimes of irrigated Caucasus chernozems (Russian SFSR, USSR) under deep drainage were investigated. A 3-m layer of the aerated zone is an active zone of vertical migration of water and soluble salts. An accumulation of soluble salts in winter was noted. In later periods a reduction of salt content in the upper meter with a simultaneous increase of salts in the lower layers took place. The source of the soluble salts is the lower layers of the aerated zone and ground waters.--Copyright 1976, Biological Abstracts, Inc.

THE GROWTH AND YIELD OF POPLAR CULTURES UNDER WATERING AND FERTILIZATION CONDITIONS, (IN BULGARIAN),
Research Station of Rapid-Growth Tree Species, Svistov (Bulgaria).
D. A. Denev.
Gorsko Stop Nauka. 11(5), p 53-62, 1974.

Descriptors: *Growth rates, *Deciduous trees, *Trees, *Water requirements, *Fertilization, *Irrigation effects, Height, Cultures, Nitrogen, Phosphorus, Drainage effects, Drainage area, Groundwater availability, Nutrients, Soil moisture, Soil-water-plant relationships, Fertilizers.
Identifiers: *Poplars, Populus euramericana, Wood mass, Basal area, *Danube River basin.

The growth of poplars on drained land along the Danube River was suboptimal due to drought and low subterranean water supply during the vegetation period and the limited soil nutrient supply. Populus euramericana cv. Vernirubens were given NPK, N-P, PK mixtures under natural soil moisture conditions; some were irrigated with 200 mm water in 3 yr. Fertilization alone had a limited effect but NPK fertilization with irrigation increased the basal area by 22.10%, height by 17.85% and wood mass by 47.20%. Results obtained with nitrogen and phosphorus individually with irrigation were almost identical and this method is recommended.--Copyright 1975, Biological Abstracts, Inc.

FIELD CHANNELS: A KEY TO BETTER INDIAN IRRIGATION,
Minnesota Univ., St. Paul. Dept. of Agricultural and Applied Economics.
K. W. Easter.
Water Resources Research, Vol. 11, No. 3, p 389-392, June 1975. 3 tab, 8 ref.

Descriptors: Irrigation, Irrigation effects, Surface irrigation, Flood irrigation, Irrigation systems, *Irrigation canals.
Identifiers: *India, *Field channels(Irrigation).

Two different programs which attempted to improve water use and management were evaluated in eastern India. The improvement was through the installation of field channels in existing flood irrigation projects. The channels gave farmers better control over water on each field. The analysis highlights the importance of technically trained people and low-cost project designs in making projects viable. Annual net returns of 300-350 rupees per acre were obtained in the Sambalpur villages with investment costs of only 34 rupees per acre. The contrasting pilot project in Raipur had a much lower profit potential due to high investment costs. The analysis adds support to the proposition that India should spend more public funds on modest improvements in existing flood irrigation systems and much less on large new irrigation projects. EFFECT OF METHOD OF NITROGEN APPLICATION ON CORN (ZEA MAYS L.) GROWN ON IRRIGATED SANDY SOIL,
Nebraska Univ., Concord. Northeast Station.
G. W. Rehm, and R. A. Wiese.
Soil Science Society of America Proceedings, Vol 39, No. 6, p 1217-1220, November-December 1975. 1 fig, 2 tab, 10 ref.

Descriptors: *Nitrogen, *Nutrients, *Fertilizers, Fertilization, *Corn(Field), Crop response, Irrigation, Leaching, Sands.
Identifiers: *Sandy soils.

Studies were conducted in 1970 and 1972 to determine the influence of method of nitrogen application on corn production on irrigated, sandy soils. Conventional preplant and sidedress treatments were compared to situations where either preplant or sidedress applications were supplemented with added N in the irrigation water. Grain yields were recorded and the NO3(-)-N distribution to 150 cm in the soil profile was measured at the end of the growing season. The influence of method of application on corn yields was related to the texture profile of the soil. For a sandy soil with no accumulation of fine textured material, the application of N with the irrigation water increased grain yields. Also, the corn crop recovered a higher proportion of the applied N when some fertilizer was added with the irrigation water. For a soil type characterized by an accumulation of fine textured material at 50-70 cm below the surface, method of N application had no influence on yield since the downward movement and loss of NO3(-)-N was restricted by the layer of fine-textured material. The data show that the application of a portion of the N fertilizer requirement with the irrigation water should be a recommended practice for corn production on sandy soils having no accumulation of fine-textured material. (Skogerboe-Colo St)

FERTILIZER OR SALT LEACHING AS AFFECTED BY SURFACE SHAPING AND PLACEMENT OF FERTILIZER AND IRRIGATION WATER,
Colorado State Univ., Fort Collins. Dept. Agricultural Engineering.
W. D. Kemper, J. Olsen, and A. Hodgdon.
Soil Science Society of America Proceedings, Vol 39, No. 1, p 115-119, January-February, 1975. 1 fig, 9 ref.

Descriptors: *Irrigation water, *Furrow irrigation, *Surface irrigation, Fertilization, *Leaching, Root zone, Irrigation effects, Return flow, *Fertilizers, Salts.
Identifiers: *Fertilizer placement.

Irrigation in furrows and placement of fertilizer bands in ridges was evaluated as a means for allowing overirrigation to bypass nitrate and reduce leaching losses. In a loamy sand, placement in a band 0 to 5 cm higher than the surface of water in the furrow allowed over 120 cm of overirrigati

efore the salt began to leave the root zone. In the lay loam a similar delay of nitrate removal was ot achieved until the band was 10 cm higher than ne water surface. This difference appeared to be ssociated with a perched water table that eveloped in the 'cultivated' layer of the clay loam oil due to higher hydraulic conductivity in cul-vated than in the lower soil. Downward move-ent of relatively concentrated salt solution near ne band, due to its greater density, was a factor at allowed fertilizer bands at lower levels to nter the mainstream of the leaching water. dentifiers: *Clones, Tatum subsoils.

reeding for increased tolerance to high aluminum w pH soils should enlarge the range of adapta-on of alfalfa. This research was undertaken to btain information on the range of genetic varia-on present in alfalfa cultivars for reaction to soil H in a high aluminum soil. Eighteen alfalfa cul-vars were planted in unlimed (pH 4.4) and limed pH 6.0) Tatum subsoil. None survived in the un-med soil and all grew in the limed soil. Clones ere selected for root development in unlimed soil fter growing down through a 5 cm layer of limed oil. When grown at pH levels of 5.3, 6.1, and 7.5, ey showed a highly significant clone X pH in-raction for yield. However, on the average they d not seem much more acid tolerant than un-elected clones. This screening technique was mewhat successful in isolating acid tolerant ones, but forage yield at low pH appeared to be a etter criterion. Results indicate that alfalfa cul-vars exhibit a narrower range of acid tolerance an is known to exist in several other crop spe-es, but that individual clones differ in their reac-on to both low and high soil pH. It was concluded at sufficient genetic variation exists to permit lection for tolerance to low pH, but the narrow netic base might limit progress. Also the overall laptation of selected populations might be mewhat unpredictable because of the clone to H interaction.

Identifiers: Alnus glutinosa, Muenster, West Germany, Westphalia, Ruderal herbs, Alders, Mowing.

Studies were carried out on 200 sections of representative creeks and ditches in north-western Westphalia (Munsterland) (West Germany) to determine how the existence or absence of riparian tree rows affected plant growth in the waterway's profile. Dense shade from the trees surpresses all aquatic and amphibious plant growth. However, full sunlight together with heavy eutrophication produces weed growth below the waterline and dense growth of ruderal herbs on the slopes. The use of mechanical mowers on the waterway's slopes is limited because they initiate erosion and destruction by muskrats. The base of the slopes is only stabilized by deeply rooted alders (Alnus glutinosa), which also prevent abundant growth of grass and herbs in the profile by their dense shade.--Copyright 1975, Biological Abstracts, Inc.

THE EFFECT OF STAND STRUCTURE ON WATER REGIME OF MOUNTAIN SOILS OF THE CARPATHIANS, (IN RUSSIAN),
All-Union Research Inst. of Soil Erosion Control, Kursk (USSR).
V. N. D'yakov.
Lesovedenie 1, p 11-17, 1976.

Descriptors: *Soil physical properties, *Soil water, Spruce, Soil moisture, Fir trees, Precipitation(Atmospheric), Flow.
Identifiers: Beech, *Carpathians region(USSR), Mountain soils.

Thirty year old beech and beech-spruce stands (in the USSR) are characterized by more favorable soil water and physical properties than spruce monocultures. For 4 hydrological years 83.5% of the precipitation fell in the beech forest; in spruce-beech, 75.2%; and in spruce, 54.8%, with respect to glades. The same tendency is characteristic of soil moistening. The greatest spring surface flow is off the glades and in the spruce stand, the smallest in spruce-beech and fir-beech forests. The surface flow is marked in heavy showers (daily intensity 100-140 mm) in spruce plantations, less in spruce-fir stands.--Copyright 1976, Biological Abstracts, Inc.

MAPPING AND MEASURING LAND-COVER CHARACTERISTICS OF NEW RIVER BASIN, TENNESSEE, USING LANDSAT DIGITAL TAPES,
Geological Survey, Nashville, Tenn. Water Resources Div.
E. F. Hollyday, and S. P. Sauer.
Water-Resources Investigations 76-106 (open-file report), September 1976. 14 p, 13 fig, 1 tab, 3 ref.

Descriptors: *Land use, *Maps, *Remote sensing, *Satellites(Artificial), *Terrain analysis, Distribution patterns, Strip mines, Coal mines, Land classification, Watersheds(Basins), Sediments, Forests, Data processing, Aerial photography, *Tennessee.
Identifiers: *Cumberland Plateau(Tenn), *Landsat digital tapes.

Land-cover information is needed to select subbasins within the New River basin, Tennessee, for the study of hydrologic processes and is also needed to transfer study results to other sites affected by coal mining. This study demonstrates that digital processing of Landsat tapes can produce maps and tables of the areal extent of selected land-cover categories. The relative area of each category within the basin is agriculture, 5 percent; evergreens, 7 percent; bare earth, 6 percent; three categories of hardwoods, 81 percent; and water, rock, and uncategorized areas, each less than 1 percent. DISCHARGE COMPUTATIONS AT RIVER CONTROL STRUCTURES,
Geological Survey, Jackson, Miss. Water Resources Div.
D. L. Collins.
Proceedings of ASCE, Journal of the Hydraulics Division, Vol 102, No HY7, Paper 12237, p 845-863, July 1976. 10 fig, 5 tab, 3 ref, append.

Descriptors: *Streamflow, *Flow control, *Hydraulic structures, *Flow rates, *Computer programs, Analytical techniques, Dams, Gates, Locks, Spillways, Turbines, Stream gages.
Identifiers: *Streamflow computations, Calibration techniques.

A procedure has been developed by the U.S. Geological Survey to calibrate regulating control structures and determine continuous records of stream-flow on highly-regulated rivers. The hydraulic theory assumes steady unform flow within a computational interval, usually 1 hr. Five different types of control have been analyzed, including tainter gates, turbine wicket gates, fixed or emergency spillways, locks, and crest gates. Field variables recorded include headwater stage, tailwater stage, gate positions, turbine scroll case pressure drops, number of lockages, and number of crest gates open. Instrumentation was developed for monitoring the necessary variables. A generalized software package has been developed to compute the continuous streamflow records at these multipurpose structures by utilizing calibration results and in-situ variables recorded by digital recorders. Two typical calibration procedures showing the general accuracy of the computational methods are presented. (Woodard-USGS)

Report NSF-RA-N-75-120, June 16, 1975. 26 p, fig, 1 tab, 9 ref. NSF AER74-03429, NSF G 44212.

Descriptors: *Geothermal studies, *Model studies, *Heat transfer, *Mass transfer, Convection, Fluid mechanics, Energy transfer, Thermal water, Groundwater, Aquifers, Mathematical models, Viscosity, Temperature, Heat flow, Geophysics.
Identifiers: *Geothermal fields.

A brief summary was given of the nondimensional equations and relevant parameters to be used for describing convection processes in the geothermal setting. Characteristic estimates of flow rates and pressure variation (beyond the hydrostatic value) were given. It was shown that the complete equation system can be reduced in complexity by neglecting terms which describe physically insignificant effects. The resulting equations were used to consider the onset of convection in a horizontal saturated porous slab when a realistic model

cosity variation was used. It was shown that the ssical constant viscosity prediction is in error h quantitatively and qualitatively. A calculation s made for the rate of convective upflow in a del fault zone. It was shown that under ap-opriate conditions it is possible to transport as ch as 2 - 3 million kg/day up a fault system with orizontal cross-sectional area of only 0.3 sq km. ms-ISWS)

surface water in the Nile River Valley is a ential water resource, the prospects and blems of its utilization are discussed. Poor inage is a major problem: without proper nage much of the newly irrigated land will be productive. Increased seepage losses from canal fields into the subsoil have exceeded the rate which water can drain to the underlying gravels. e rising water table has brought with it problems increased saline water intrusion. Tile drainage tems being constructed should cope with the eat posed by shallow ground waters. A major rce of subsurface water are the Nubian sand-ne aquifers which contain 6000 billion cubic ters of water. The question of whether these ters should be mined is discussed. One proposal or the creation of a 'New Valley' in the Lybian ert west of the Nile River to link a series of pressions in which artesian springs once flowed m the exposed sandstone aquifer. Studies are ng conducted in Egypt to evaluate these pro-ts. At present Egypt has decided to invest ources in drainage projects and small scale in-tigations of the Nubian sandstones rather than onumental water project. (Jamail-Arizona)

AN APPRAISAL OF GROUND WATER FOR IRRIGATION IN THE APPLETON AREA, WEST-CENTRAL MINNESOTA,
Geological Survey, Reston, Va. Water Resources Div.
S. P. Larson.
Available from Supt. of Documents, GPO, Wash., D.C. 20402, price $2.60. Water-Supply Paper 2039-B, 1976. 34 p, 14 fig, 3 plates, 4 tab, 17 ref.

Descriptors: *Groundwater resources, *Supplemental irrigation, *Water yield, *Water quality, *Aquifer characteristics, Model studies, Mathematical models, Pumping, Drawdown, Groundwater recharge, Streamflow, Base flow, Diversion, *Minnesota.
Identifiers: West-Central Minnesota.

Supplemental irrigation of well-drained sandy soils has prompted an evaluation of ground water in the Appleton area in Minnesota. Glacial drift aquifers are the largest source of ground water. The surficial outwash sand and gravel is the most readily available and the most areally extensive drift aquifer, and it underlies much of the sandy soil area. Saturated thickness of the outwash is more than 80 feet in places, and potential well yields may exceed 1,200 gal/min in some areas. In about 17 percent of the area, yields of more than 300 gal/min are obtainable. Recharge to the outwash aquifer occurs primarily during the spring thaw and averages about 5 inches annually. Most discharge from the aquifer appears as base flow in the Pomme de Terre River. Despite dissolved-solids concentrations ranging from 280 to 1,350 mg/liter, the water is chemically suitable for irrigation. Mathematical models of a part of the aquifer were made to evaluate the effects of 20 successive years of ground-water withdrawal for three irrigation-development patterns. It was estimated that the present annual withdrawal rate of 1,410 acre-ft would result in water-level declines of less than 3 feet. However, annual withdrawals of 8,450 acre-ft would cause aquifer dewatering and decreased well yields in some places. After a new state of equilibrium was established in response to withdrawals, most of the withdrawal would be supplied by diverted base flow from the Pomme de Terre River. (Woodard-USGS)

DIGITAL GROUND-WATER MODEL OF THE OGALLALA AQUIFER IN PARTS OF WASHINGTON AND YUMA COUNTIES, NORTHERN HIGH PLAINS OF COLORADO,
Geological Survey, Lakewood, Colo. Water Resources Div.
G. W. Kapple, R. R. Luckey, and W. E. Hofstra.
Colorado Water Conservation Board, Denver, Colorado Water Resources Circular No 34, 1976. 25 p, 15 fig, 15 ref.

Descriptors: *Groundwater mining, *Model studies, *Pumping, *Irrigation wells, *Drawdown, Forecasting, Digital computers, Mathematical models, Aquifer characteristics, Evaluation, *Computer models, *Colorado, Great Plains.
Identifiers: Northeastern Colorado, *Ogallala formation(Colo).

A finite-difference digital model was developed to simulate the effects of future pumping on a part of the Ogallala aquifer in the northern High Plains of Colorado. The model area covers 768 square miles (1,990 square kilometers) of Washington and Yuma Counties and is the fourth area to be modeled in the northern High Plains project. Ground water in this area is used principally for irrigation and about 215 large-capacity (greater than 100 gallons per minute or 6.3 liters per second) wells were installed through 1973. Calibration of the model was achieved by comparing observed and calculated water-level changes for 1964-73. The calibrated model was used to predict future declines based on extended 1973 pumpage and estimated future pumpages with the hypothetical addition of 107 and 199 wells between 1973-83. These predictions indicate that through the year 2000 saturated thickness would remain greater than 50 feet (15.2 meters) over most of the area. Maximum declines of from 55 to 85 feet (16.8 to 25.9 meters) would occur near Yuma. The model was most sensitive to variations in pumpage and specific yield and least sensitive to transmissivity. (Woodard-USGS)

MAJOR AQUIFERS IN HAND AND HYDE COUNTIES, SOUTH DAKOTA,
Geological Survey, Huron, S.D. Water Resources Div.
N. C. Koch.
South Dakota Geological Survey, Vermillion, Information Pamphlet No 14, 1976. 5 p.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water yield, *Water quality, *Water utilization, Water supply, Available water, *South Dakota.
Identifiers: Hand County(S Dak), Hyde County(S Dak).

This information pamphlet describes the general distribution, quantity, and quality of ground water available from the major aquifers in Hand and Hyde Counties, South Dakota. The data were collected by the U.S. Geological Survey and the South Dakota Geological Survey during the period of 1972-75. The Tulare aquifer underlies an area of about 950 sq mi in northern Hand and Hyde Counties. The aquifer may yield as much as 1,000 gpm of water to properly-constructed wells at depths ranging from 10 to 200 ft. Water in the Tulare aquifer is predominantly of calcium bicarbonate or sodium sulfate type with dissolved solids ranging from 200 to 1,800 mg/liter. Water in the Highmore aquifer is predominantly of calcium bicarbonate or sodium sulfate type with dissolved solids ranging from 500 to 2,000 mg/liter. The Highmore aquifer underlies an area of about 100 sq mi in central Hyde County. The aquifer may yield as much as 1,000 gpm of water to properly-constructed wells at depths ranging from 20 to 200 ft. The Elm Creek aquifer underlies an area of 30 sq mi in southwestern Hand County and southeastern Hyde County. The aquifer may yield as much as 1,000 gpm of water to properly-constructed wells at depths ranging 20 to 100 ft. Water in the Elm Creek aquifer is predominantly of calcium bicarbonate or calcium sulfate type with dissolved solids ranging from 500 to 1,000 mg/liter. It is of suitable quality for domestic, stock, municipal, and irrigation use. The Bad-Cheyenne River aquifer underlies an area of about 200 sq mi in Hyde and Hand Counties. The aquifer may yield as much as 1,000 gpm of water to properly-constructed wells at depths ranging mostly from 250 to 330 ft. Water in the Bad-Cheyenne aquifer is of the sodium bicarbonate type with dissolved solids ranging from 1,300 to 1,800 mg/liter. It is of suitable quality for stock and domestic uses. (Woodard-USGS)

WINTER RUNOFF FROM AN URBAN CATCHMENT, (JANUARY TO MARCH 1974),
Nova Scotia Technical Coll., Halifax. Dept. of Civil Engineering.
D. H. Waller, and W. A. Coulter.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 41, Environmental Protection Service, Environment Canda, Ottawa, Canada, 1974, 50p., 1 app., 7 fig., 16 tab, 11 ref. 74-8-3.

Descriptors: *Snowmelt, *Urban runoff, Drainage water, Winter, Precipitation(Atmospheric), Dusts, Rainfall, Snow, Roads, Suspended solids, *Canada, Watersheds(Basins).
Identifiers: Halifax, Nova Scotia.

Information about winter runoff and snowmelt was obtained for a 163 acre combined sewer drainage area in Halifax, Nova Scotia, from January to March of 1974. Limited amounts of data were obtained for: precipitation; dustfall; snow quantity, quality and density; amount and composition of street solids accumulation and of sand used for ice control; composition of runoff due to snowmelt and rainfall; and, composition and flow rate of dry weather flow and combined sewage. The information obtained is discussed in terms of its application to development or testing of runoff quantity and quality models. (Environment Canada)

MAN'S IMPACT ON EROSION IN THE RURAL ENVIRONMENT: THE INDIAN EXPERIENCE,
International Hydrological Decade, New Delhi (India). Indian National Committee.
V. B. Lal, and S. Banerji.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No. 113, p 46-52, 1974. 1 fig, 3 tab, 13 ref.

Descriptors: *Erosion, *Rural areas, *Watersheds(Basins), Land use, Reservoirs, River systems, History, Planning, Land management, River basin development, Soil conservation.
Identifiers: *India.

Many large-scale engineering works have taken place in India since 1947. These include river valley projects, road networks in border areas, the construction of industrial complexes, and urban expansion. These projects have involved deforestation and an encroachment on the rural environment which have both affected the silt-flow regime in the rivers. In turn, this changed regime has affected canals and reservoirs and caused the meandering of river courses over tracts of land often as much as tens of kilometers wide. The paper gave a brief account of these problems in the Indian experience, and included examples of a few catchments of important river valley projects in India where soil conservation measures on a significant scale had been adopted. The reasons behind the adopted measures were discussed, and an assessment was given of their effectiveness in the short period since their implementation. (See also W77-02771) (Humphreys-ISWS)

EFFECTS OF MAN'S ACTIVITIES ON EROSION IN RURAL ENVIRONMENTS AND A FEASIBILITY STUDY FOR REHABILITATION,
Indonesia Univ., Djakarta. Faculty of Technology.
R. S. Partosedono.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No. 113, p 53-56, 1974.

Descriptors: *Erosion, *Rural areas, *Watersheds(Basins), Land use, River systems, River basin development, Irrigation, Reservoirs, Planning, Rehabilitation, River basins.
Identifiers: *Indonesia, *River Cimanuk.

The catchment area of the River Cimanuk is about 3322 sq km, and the length of the River Cimanuk is 180 km. The average rainfall is 1740 mm, and the maximum discharge in the rainy season is about 1300 cu m/s while the minimum discharge is only 1.5 cu m/s in the dry season. The density of foresests in the area is only 21% which the beginning of the World War II decreased by 5%. Deafforestation caused many areas to be very badly eroded, so that excessive sedimentation occurred in the lower reaches and the delta of the River Cimanuk. Annual erosion is 5 mm, and observations of the River Ciluning in the years 1911-1912 and 1934-1935 indicated that an average of 2890 tons/sq km of fertile soil had been removed by flood water. Population increase in the catchment area is 2.3% per annum. Because agricultural productivity is decreasing, many difficulties have arisen including a decrease in the food supply. Hence, people who can no longer produce a living in the area are leaving the basin and moving to several towns in West Java, thereby creating urbanization problems. Processes of erosion and sedimentation as well as the formation of the delta on the shore of the River Cimanuk have made the maintenance of the irrigation system in the basin impossible. processes of erosion and sedimentation were dynamic state along the River Nile and its l islands during flood times. However, after ling the High Dam of Aswan, the situation ged and these islands appeared to be in a sta-position. The following observations for the r Nile near Cairo were noted: (1) There was little change of water surface elevation after High Dam Construction. This may be due to backwater effect of the Delta Barrage some 25 north of Cairo, (2) The bed level increased tly in certain locations, (3) The cross-section es are more uniform within the straight reach the main island, and (4) The suspended sediment concentration is rather higher than expected but much less than that before construction of the dam. It was concluded that a few islands south of Cairo could be used for urban facilities after some river control work has taken place. (See also W77-02771) (Humphreys-ISWS)

INCREASE OF SEDIMENT TRANSPORT DUE TO LARGE-SCALE URBANIZATION,
National Research Centre for Disaster Prevention, Tokyo (Japan).
T. Kinosita, and Y. Yamazaki.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No. 113, p 127-129, 1974. 1 tab, 1 ref.

Descriptors: *Urbanization, *Sediment yield, *Surveys, Land development, Suburban areas, Drainage systems, Ponds, Reservoir silting, Land use, Reservoirs, On-site investigations.
Identifiers: *Japan, *Tokyo.

New towns are now under development in the suburbs of Tokyo. Sediment transport due to large-scale urbanization was measured in flood-storage ponds during the period of land development. Average annual sediment transport to the flood-storage ponds from loam and sand layers due to land development construction was 10.4 mm/year per hectare of drainage area. After completion of the pavements, grass cover of the earth surface, and lining of ditches for drainage, the sediment yield tended to zero. (See also W77-02771) (Humphreys - ISWS)

Identifiers: *Mexico City.

There has been a surge in the growth of Mexico City in recent years. As a result, the population of the western part of the City is in danger from water runoff. This paper analyzed the principle hydrological phenomena that have had their equilibrium unbalanced during the period 1961-1971. Some relationships were established, trends were studied, and some deductions were made. In particular, it was concluded that there is little variation between precipitation and runoff and that the suspended sediment is real. Therefore, very careful planning of urban growth was recommended which should take into account the protective influence of vegetation. (See also W77-02771) (Humphreys - ISWS)

SUSPENDED SEDIMENT PRODUCTION AND BUILDING ACTIVITY IN A SMALL BRITISH BASIN,
Exeter Univ. (England). Dept. of Geography.
D. E. Walling.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No. 113, p 137-144, 1974. 5 fig, 3 tab, 15 ref.

Descriptors: *Small watersheds, *Urbanization, *Sediment yield, *On-site investigations, Watersheds(Basins), Cities, Suspended load, Sediment discharge, Runoff, Hydrographs, Land development, Land use.
Identifiers: *United Kingdom, Sediment concentration.

A study is being carried out on the influence of building activity on suspended sediment production from a small basin on the margins of Exeter. Records from the period August 1968 to March 1971, when the basin was essentially undisturbed, were used to calibrate its response and to assess the changes that occurred during 1973 when 25% of its area was influenced by building activity. On average, sediment concentrations have increased 5 fold and sediment loads 5 to 10 fold. (See also W77-02771) (Humphreys - ISWS)

EFFECT OF LAND DEVELOPMENT ON SOIL EROSION AND SEDIMENT CONCENTRATION IN AN URBANIZING BASIN,
Parsons, Brinckerhoff, Quade and Douglas, Inc., New York.
C-N. Chen.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No. 113, p 150-157, 1974. 4 fig, 2 tab, 9 ref.

Descriptors: *Urbanization, *Land development, *Sediment yield, *District of Columbia, *Maryland, Cities, Land use, Soil erosion, Construction, Watersheds(Basins), Sedimentation rates, Runoff, Sediment discharge.
Identifiers: Sediment concentration.

Based upon data collected from drainage basins in the metropolitan regions of Washington, D.C. and Baltimore, the soil erosion rates from construction sites and non-construction lands were determined. The gross soil erosion from an urbanizing basin, with various percentages of area undergoing construction, was then evaluated on the basis of the erosion rates from (1) non-construction lands, (2) construction sites without erosion control, and (3) construction sites with different levels of on-site control practices. With regard to sediment runoff in the stream, a functional relationship was established to correlate the sediment concentrations with (1) the soil erosion rates from construction sites, (2) the percentage of basin area undergoing construction, (3) the sediment delivery ratio of the basin, and (4) the direct runoff in the stream. The quantitative information established in this study provides a tool to assess the potential impact of both controlled and uncontrolled land development on soil erosion and sediment concentration in an urbanizing basin. Furthermore, the information can be used as a guide in setting criteria for erosion control practices in terms of soil-loss limits from construction sites and/or sediment concentrations in streams. IMPACT OF URBANIZATION ON WATER YIELD, FLOOD PEAK SEDIMENT YIELD, AND WATER QUALITY IN THE BERKELEY HILLS, CALIFORNIA,
California Univ., Berkeley. School of Forestry and Conservation.
J. R. McBride.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 077, Price codes: A02 in paper copy, A01 in microfiche. California Water Resources Center, Davis, Completion Report, September 1976. 16 p, 7 fig, 3 tab, 5 ref. (California Water Resources Center Project UCAL-WRC-W-445). OWRT A-049-CAL(1).

Descriptors: *Urbanization, *Watersheds(Basins), *Sediment yield, *Flood peak, *Water quality, *Water yield, *California, Watershed management
Identifiers: Berkeley Hills(Calif), Urban watershed.

The objective was to determine the impact of urbanization on the hydrologic characteristics of watersheds in the Berkeley Hills of central California. The initial approach was to calibrate three stream gaging stations prior to the development of one watershed above one of these stations and to follow changes in hydrologic characteristics during and subsequent to development. Economic and political developments in 1974 and 1975 prevented the developer from building on the principal watershed. A summary of data on annual water yield, characteristics of flood peaks, sediment yield, and water quality for the three non-urban watersheds is presented. A subproject completed during the study compared periodicity of streamflow in previously urbanized and non-urbanized watersheds in the Berkeley Hills. Two daily discharge peaks which lagged 1.5 hours behind two daily peaks in lawn irrigation were observed. Peak daily streamflow on the urbanized watershed was 10 times that of a similar non-urbanized watershed. The stream from the urbanized watershed ceased flowing from late July until mid-October. EFFECTS OF SOIL CONSERVATION TREATMENT ON RUNOFF AND SEDIMENT LOSS FROM A CATCHMENT IN SOUTHWESTERN NEW SOUTH WALES, AUSTRALIA,
Soil Conservation Service of New South Wales, Sydney (Australia). Wagga Research Station.
C. M. Adamson
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment, Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No 113, p 3-14, 1974. 6 fig, 5 tab, 4 ref

Descriptors: *Soil conservation, *Land management, *Demonstration watersheds, Watersheds(Basins), Sediment control, Rainfall, Runoff, Land reclamation, Soil erosion, On-site investigations, Hydrographs, Data collections, Hydrologic data, Flow duration.
Identifiers: *Australia, *New South Wales.

The effects of completely treating one catchment with soil conservation practices were compared with another similar catchment on which no improvements have been undertaken. The effects of soil conservation structures combined with improved land management practices resulted in significant hydrological changes in the treated catchment, namely: (1) Overall reductions in runoff and soil loss have occurred. The overall reduction in runoff is 74% while sediment losses have been reduced by 99%. (2) Much of the reduction in runoff is attributed to the contour furrows which restrict overland flow and increase depression storage. (3) Effects are greatest in years with below average-to-average rainfall. When above average rainfalls are recorded, annual yields of runoff increase but soil losses do not increase proportionately. (4) During storms, the greatest reduction in runoff occurs for the earliest part of the storm. With increasing depths of precipitation, the effect of runoff reduction is less. Eventually, rate of runoff may exceed that from the untreated catchment. (5) Base flows commence at higher discharges and have lower recession values than do base flows from the untreated catchment, and (6) Carrying capacity and pasture production are greatest for the treated catchment. APPROACHES TO CONTROLLING ERO
IN RURAL AREAS,
Strathclyde Univ., Glasgow (Scotland). De Civil Engineering.

. Fleming.
: Effects of Man on the Interface of the ydrological Cycle with the Physical Environ-ent; Proceedings of Paris Symposium, Sep-mber 1974. International Association of ydrological Sciences Publication No 113, p 68-, 1974. 12 ref.

escriptors: *Erosion control, *Rural areas, Reviews, Vegetation establishment, Erosion, ediment transport, Sediment control, Planning, and use, Conservation, Adoption of practices, and management.

he intensive utilization of rural areas for the set-ement of expanding populations and for the in-eased production of food and timber can lead to cute sediment erosion problems when careful anning is not implemented. The conservation of il resources, while at the same time permitting eir maximum development for man, calls for search which integrates all the factors relating to e sediment problem in entire basins, followed by e application of research knowledge at the local nd regional level. Considerable experience al-ady exists on practical measures which may be sed to control erosion, including vegetation anagement, land use, and physical control struc-ires. To be effective, conservation measures ust be based on an understanding of all factors volved, human as well as physical. (See also 77-02771) (Humphreys-ISWS)

HE ROLE OF FOREST STANDS IN THE CON-ROL OF EROSION PROCESSES AND OTHER EGATIVE NATURAL PHENOMENA,
. T. Nikolayenko.
n: Effects of Man on the Interface of the ydrological Cycle with the Physical Environ-ent; Proceedings of Paris Symposium, Sep-mber 1974. International Association of ydrological Sciences Publication No. 113, p 83-, 1974.

escriptors: *Erosion control, *Forests, *Water uality, Water pollution, Watersheds(Basins), Ru-off, Trees, Reservoirs, Rivers, Vegetation ef-ects, Slope protection, Potable water, Sediments. dentifiers: *USSR.

ong-term observations and studies to determine he protective functions of tree shrub vegetation evealed the important role that vegetation plays in he removal of sediment from runoff. As a result f many years observation (Moscow region), it has een established that a 30 m wide strip almost en-rely arrests sediment from treeless, arable slopes f length 190-200 m and gradient of 3 deg. Exten-ve investigations showed that forest stands could revent or reduce to a significant extent bank brasion of rivers, reservoirs, and other bodies of ater which causes great damage to the economy. was also shown that forest improves many pro-erties of water such as color, transparency, and ven taste. After passing through a forest stand, ater is purified from ammonia, alkali, and other oxious substances. Numerous experiments evealed one more beneficial feature of forest - it etains not only chemically harmful substances, ut also microbes which are very dangerous to human life. Experiments conducted in various regions of the country (Moscow, Orel, Penza, and elsewhere) showed that after having passed through a 30-40 m wide forest strip, the number of microbes in the water was reduced by a factor of 2 or more. PREDICTING SEDIMENT YIELD FREQUENCY FOR RURAL BASINS TO DETERMINE MAN'S EFFECT ON LONG-TERM SEDIMENTATION,
Agricultural Research Service, Temple, Tex.
J. R. Williams.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No. 113, p 105-108, 1974. 2 tab, 5 ref.

Descriptors: *Sediment yield, *Watersheds(Basins), *Iowa, *Nebraska, *Texas, Rural areas, Forecasting, Small watersheds, Frequency curves, Runoff, Erosion control, Soil erosion, Soil types, Land management, Sedimentation, Sediment discharge, Land use, Floods.
Identifiers: Erosion index, Universal soil loss equation.

Long-term sediment yields were used to determine man's effect on sedimentation in a rural environment. Sediment yields for floods of five different frequencies were computed using modified universal soil loss equation to determine a sediment frequency curve. The universal equation was modified by replacing the rainfall energy factor with a runoff rate and volume factor for basin application. Runoff frequency curves used in determining sediment frequency can be obtained from runoff measurements or computed with mathematical models. Man's effect on sediment yield is expressed by the cropping management and the erosion-control-practice factors of the universal equation. The long-term effect can be determined for any particular land use and management system by computing a sediment yield frequency curve with appropriate values of the cropping management and erosion-control-practice factors. The area under the sediment frequency curve is used to obtain the average annual sediment yield, and the slope of the curve indicates the variation in individual storm sediment yields. Since only five different storms are needed to define the sediment frequency curve, many alternative land use and mangement systems can be considered. The procedure is useful in planning land use and management practces for large rural basins. (See also W77-02771) (Humphreys-ISWS)

SOIL COVER GOVERNS SOIL LOSS ON UNITED STATES CLAYPAN SOILS,
Agricultural Research Service, Columbia, Mo. North Central Region Watershed Research Center.
H. G. Heinemann, and F. D. Whitaker.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No. 113, p 109-113, 1974. 3 fig, 5 ref.

Descriptors: *Soil erosion, *Erosion control, *Land use, *Land use, *Land management, On-site investigations, Hardpan, Clays, Soil management, Cultivated lands, Vegetation effects, Corn(Field), Cultivation, Soil conservation.
Identifiers: Claypan soils.

Soil surveys before 1936 showed that midwestern farmers had lost about 17.5 cm (about one-half) of the original topsoil from the sloping claypan soils in about 70 years of clean-till farming. Production declined rapidly with continued removal of nutrients and topsoil in runoff. Early research showed that the use of adequate fertilzer and good residue management practices were helpful in reducing soil loss except during extremely wet seasons. Soil loss in 1969 from areas sown with corn continuously and grown with previously 'acceptable practices' was 143 tonnes/ha. Most of the soil loss occurred when the soil cover was inadequate. Research (1954-1973) showed that leaving about 50% of the previous crop's residue on the soil surface at planting reduced soil loss to less than one-half that from conventional (clean-tilled) seedbeds. The average annual loss for the 20-year period was 2.69 and 6.05 tonnes/ha, respectively. Research (1970-1973) showed that no-till planting techniques in which corn is planted directly through the previous crop's residue, or in a cover crop, reduced soil loss to about one-eighth that of conventionally tilled corn. The average annual losses were 1.28 and 9.75 tonnes/ha, respectively. Corn yields were nearly equal from all treatments. (See also W77-02771) (Humphreys-ISWS)

Descriptors: *Slopes, *Slope stabilization, *Slope protection, *Soil erosion, *Erosion control, Soil chemical properties, *Vegetation establishment, Vegetation, Plants, Runoff, Fertility, Soil types, Soil properties, Nutrients, Infiltration, Monsoons, Interception, Erosion, Degradation(Slope), Regime.
Identifiers: Rajasthan, *India.

The effect of erosion on sandy and sandy loam soils in areas with steep slopes was investigated. A field experiment was conducted during the monsoon season to determine the effects of heavy rainfall upon these slopes and the efficiency of various types of vegetation cover in preventing erosion. Runoff, soil losses, fertility losses and infiltration rate are reported. The increase in runoff with increasing slope may be due to greater water velocity: falling rain drops find less time for absorption. Greater soil and water losses were recorded from the bare plots as compared to those covered with vegetation which intercepts raindrops' impact and provides obstruction to the flow of water. Increase in slope reduced the organic carbon and nitrogen content of the soil as fine particles were washed away. Levelled plots gave slightly better infiltration as compared to plots on slopes, but the difference was not significant. (Jamail-Arizona)

DETERMINATION OF MONOHYDRIC LOW-MOLECULAR PHENOLS IN SPENT LIQUORS AND PULP MILL EFFLUENTS (BADANIA NAD OZNACZANIEM JEDNOWODOROTLENOWYCH NISKOCZASTECZKOWYCH ZWIAZKOW FENOLOWYCH W LUGACH I SCIEKACH Z CELULOZOWNI),
B. Pszonka.
Przeglad Papierniczy, Vol. 32, No. 7, p 237-242, July, 1976. 2 fig, 41 ref, 2 tab.

Descriptors: *Pulp wastes, *Phenols, *Gas chromatography, *Pollutant identification, Wastes, Industrial wastes, Water pollution sources, Analytical techniques, Separation techniques, Organic compounds, *Waste identification, Effluents.
Identifiers: *Kraft mills.

A description is given of a method for separating monohydric phenols from kraft mill effluents. The gas chromatographic method was developed on the basis of preliminary experiments with known mixtures of mono-, di-, and trihydric phenols, using various solid and stationary liquid phases for the separation of free phenols, their methyl ethers, and their acetates. The best separation was obtained in columns with 15% silicone oil SE-30 on Gas Chrom Q 80/100 mesh. The di- and trihydric phenol could be separated only after conversion of the ethers (acetates were less well suited), but the determination errors were great, and further studies are needed for the development of a better procedure. Monohydric phenols (phenol, cresols, xylenols, and chlorophenols) could be separated and identified in the presence of nontoxic phenolic compounds (guaiacol, acetovanillone, acetosyringone) with an accuracy of 5%. The application of this method to effluents from 4 kraft mills (black liquors, evaporator condensates, and overall effluents before and after purification) showed a phenol composition similar qualitatively but different quantitatively in all samples. A comparison with the results of determinations by the standard 4-aminoantipyrine method confirmed the assumption that the content of toxic phenols is much lower than the content of total phenols as determined by the standard method. (Stapinski-IPC)

Descriptors: *Water analysis, *Pollutant identification, *Polarographic analysis, *Herbicides, Water pollution sources, Trace elements, Natural streams, Chromatography, Anion exchange, Nitrogen compounds, Analytical techniques, Water chemistry, Water properties.
Identifiers: Glyphosate, N-phosphonomethylglycine.

A differential-pulse polarographic method for the determination of residues of glyphosate (N-phosphonomethylglycine) herbicide in natural waters down to 35 micrograms/liter is described. The material is concentrated by chromatography on an anion-exchange column, which at the same time performs the sole purification required. A polarographically active glyphosate derivative is obtained by nitrosation performed directly in a fraction of the eluate from the column. The precision in terms of relative standard deviation varies from 22.8% at the detection limit to 2.3% at 210 micrograms/liter. The total analysis time for one sample is 3-4 hr. (Witt-IPC)

GRAPHICAL INTERPRETATION OF WATER QUALITY DATA,
Mississippi State Univ., Mississippi State. Dept. of Civil Engineering.
J. L. Mahloch.
Water Air Soil Pollut. 3(2), p 217-236, 1974.

Descriptors: *Water quality, *Data collection, Pollutant identification, *Graphical methods, Analytical techniques, Water pollution, Data processing.

Management of water resources through planning and control of water pollution hinges on the availability and interpretation of water quality data on which to base management decisions. Graphical methods are explored which allow rapid and informative analysis of water quality data. The graphical methods fall into 2 main categories. The 1st category relates to graphical procedures which are developed as part of a statistical test, such as discriminant analysis. The 2nd category involves approximation of multivariate water quality data into 2 dimensions. The methods for accomplishing the latter are canonical decomposition and higher dimensional plotting. Each of these methods is developed and used on an example set of data to demonstrate their utility. These methods not only present a graphical representation of the data, but also explain variations and interrelationships within the data itself.—Copyright 1975, Biological Abstracts, Inc.

COMPARATIVE METHYLATION CHEMISTRY OF PLATINUM, PALLADIUM, LEAD, AND MANGANESE,
California Univ., Livermore. Lawrence Livermore Lab.
R. T. Taylor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 55. Price codes: A03 in paper copy, A01 in microfiche. Report EPA-600/1-76-016, March 1976. 25 p., tab., 11 fig., 14 ref.

Descriptors: *Biochemistry, *Metals, *Lead, *Manganese, *Toxicity, Vitamins, Metabolism, Transportation, Chemical wastes, Fuel, Gasoline, *Public health, Mammals, *Air pollution, Air pollution effects, Human disease, Aquatic environment.
Identifiers: *Platinum, *Palladium, *Methylation(Biochemical), Fuel additives, Automotive fuels, Catalytic control devices, Methylcobalamin, Platinum 4+, Mammalian cells.

A study was carried out to evaluate the potential for platinum, palladium, lead, and manganese salts and oxides to be biochemically methylated. Methylation is an important, well recognized determinant of metal toxicity; the striking example being the extreme health hazard of methylated mercury. The possible biological methylation of the metals which are associated with emissions arising from the use of automotive fuels, fuel additives, and catalytic control devices is of special concern to the Environmental Protection Agency's Catalyst Research Program. Salts of platinum, palladium, and lead, and oxides of lead all containing the metal in a 4+ valence were observed to demethylate methylcobalamin, a biologically active form of vitamin B-12. Inorganic salts and oxides of manganese were unreactive. No evidence for a stable monomethyl-metal derivative was found using palladium and lead compounds as reactants. However, salts of platinum 4+ do result in the formation of stable methylation product

he reaction product formed from methyl-obalamin and hexachloroplatinate was shown efinitively to be a monomethyl-platinum com-ound. It is sufficiently stable in aqueous solutions nder a variety of conditons to exist in freshwater cosystems and to exhibit toxic effects on mam-alian cells. (Katz)

he low concentration of hydrocarbons an-ipated in pollution baseline studies necessitates e development of analytical techniques sensitive the sub-microgram per kilogram concentration vel. The method of analysis developed in this oratory involves dynamic headspace sampling r volatile hydrocarbon components of the sam-e followed by coupled-column liquid chromatog-phy for the non-volatile components. These chniques require minimal sample handling, ducing the risk of sample component loss and/or mple contamination. Volatile sample com-nents are separated from the matrix in a closed stem and concentrated on a TENAX-GC packed e-column, free from large amounts of solvent d ready for GC/GC-MS analysis. Non-volatile mpounds, such as the benzpyrenes, may be ex-cted from large volumes of water and concen-ted on a Bondapak C18 packed pre-column for upled-column liquid chromatographic separa-n and analysis. Results of the application of these techniques are presented and discussed. (Katz)

SAMPLING AND ANALYSIS OF SELECTED TOXIC SUBSTANCES. TASK II-ETHYLENE DIBROMIDE,
Midwest Research Inst., Kansas City. Mo.
J. Going, and S. Long.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 213, Price codes: A03 in paper copy, A01 in microfiche. Report EPA-560/6-75-001, September 1975. 30 p, 5 tab, 10 fig, 11 ref.

Descriptors: *Monitoring, *Organic compounds, *Chemical analysis, *Bromine, Halogens, *Water pollution, *Air pollution, *Path of pollutants, *Pollutant identification, Public health, Industrial wastes, *Sampling, *Bromides.
Identifiers: *Ethylene dibromide, Potential carcinogen, *Pesticide, *Fumigant, Retail gasoline station, Oil refinery, Ambient air level.

Ethylene dibromide has recently been reported by the NCI to be a potential carcinogen. Its commercial use is predominantly as a scavenging agent for lead in gasoline. A minor usage is a pesticide fumigant. A protocol was developed for the sampling and analysis of ethylene dibromide in ambient air and surface water. The range in concentration of ethylene dibromide in the air and the site where it was collected are as follows: manufacturing sites, 4.2 to 115 micrograms/M3; oil refinery, 0.23-1.65 micrograms/M3; urban locations near retail gasoline stations and with heavy vehicular traffic, 0.069 to 0.11 micrograms/M3. Two water samples collected from streams near an oil refinery and a manufacturing site were found to contain 1.13 and 1.05 ppb ethylene dibromide, respectively. Further work to clarify ambient air levels and to assess whether they may represent a health risk is anticipated, but the very low levels detected to date are not thought to present a significant risk to health. SCANNING THERMAL PLUMES,
Wisconsin Univ., Madison. Marine Studies Center.
F. L. Scarpace, R. P. Madding, and T. Green, III.
Sea Grant College Reprint No. WIS-SG-76-362, Reprinted from: Photogrammetric Engineering and Remote Sensing, Vol 41, no. 10, p 1223-1232, October 1975. 17 fig, 2 tab, 5 ref.

Descriptors: *Powerplants, *Thermal pollution, *Water pollution, *Wisconsin, *Lake Michigan, Thermal plumes, Temperature, *Pollutant identification, *Remote sensing, Path of pollutants.
Identifiers: *Temperature gradient, Airborne thermal scanners, Scanners, Ground truth data.

Thermal plumes associated with the condenser cooling of power plants despite their small size are difficult to characterize. Over 800 thermal line scans of power plant plumes taken during the past three years indicated that their mixing with the nearshore lake water is extremely complex and highly dependent on envrionment conditions. A cooperative effort to monitor all thermal plumes along the Wisconsin shore of Lake Michigan has been undertaken. Since December 1972, thermal line scans of all the major power plants in the State of Wisconsin have been acquired on a twice weekly basis. An overview of the techniques used at the University of Wisconsin for analyzing thermal scanner data as applied to the imagery from the Point Beach power plant at Two Creeks, Wisconsin (on Lake Michigan) is described. CONCENTRATIONS AND CONCENTRATION FACTORS OF HEAVY METALS IN BROWN ALGAE,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
P. Foster.
Environmental Pollution, Vol. 10, p. 45-53, 1976. 1 fig., 4 tab., 15 ref.

Descriptors: *Absorption, Algae, *Heavy metals, *Phaeophyta, Zinc, Copper, Nickel, Manganese, *Bioindicators, *Trace elements, Cadmium, Lead, Chromium, Monitoring, Analytical techniques, Environmental effects, *Marine algae, *Pollutant identification.
Identifiers: Bioaccumulation, *Fucus sp., *Ascophyllum sp., *Menai Straits.

Concentrations and concentration factors of zinc, copper, manganese, and nickel in Fucus vesiculosus and Ascophyllum nodosum collected from the Menai Straits are presented. Temporal variations in dissolved trace metal concentrations to which these algae are exposed have been intensively monitored for several years. Algal concentrations are compared with those of similar samples taken from a highly polluted area. Both species are recommended as potential biological indicators for copper. F. vesiculosus is more sensitive to increases in the mean ambient dissolved concentrations of zinc. For neither species does a direct relationship exist between concentrations of iron and manganese in the weeds and water. Algal concentrations of cadmium, lead and chromium are also discussed. In highly polluted environments algal concentrations of minor elements do not reflect the water concentrations to which they have been exposed. (Katz)

PHYTOPLANKTON PRODUCTION MEASUREMENTS WITH CARBON-14 WITH CONSIDERATION OF LABELED ORGANIC MATTER LOSSES DURING FILTRATION, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
V. V. Bul'on.
Okeanologiya 15(3), p 503-507, 1975.

Descriptors: *Phytoplankton, *Plankton, *Carbon filters, Filtration, Coasts, Oxidation, Photosynthesis, Photosynthetic oxygen, *Primary productivity, *Organic matter, Asia, Pollutant identification.
Identifiers: *Carbon-14, Organic matter, Losses, Permanganate, Plankton radioactivity.

Plankton primary production was determined by the 14C method at 9 stations in the coastal waters of eastern Asia. Losses of labeled organic matter during filtration of the samples were as great as 49% of the assimilated C. The major part of the lost photosynthetic product was represented by chemically stable compounds because oxidation with permanganate was only 10-40% of that of the more effective photooxidation method. The inverse relationship between plankton radioactivity on the filters and the duration of filtration indicates that the appearance of photosynthetic products on the filters is primarily a consequence of mechanical damage of phytoplankton cells during filtration.--Copyright 1976, Biological Abstracts, Inc.

DETERMINATION OF SMALL AMOUNTS OF MERCURY,
Kodak (Australasia) Pty Ltd., Coburg (Australia). Research Labs.
S. Chilov.
Talanta. 22(3), p 205-232, 1975.

Descriptors: *Mercury, *Pollutant identification, Trace elements, Analytical techniques, Emission spectroscopy, Polargraphic analysis, Colorimetry, Chromatography, X-ray analysis.

Since analysis for trace amounts of Hg is most often carried out on environmental samples (tissue, water, air) most methods of analysis will encounter at least some interference as well as being dependent on preliminary digestion to bring Hg into solution in the desired form. The following techniques and their advantages and disadvantages are discussed: X-ray fluorescence, spectrographic emission, electrochemistry (polarography), colorimetry, atomic fluorescence, radiochemistry, neutron activation, isotope dilution, chromatography, conventional atomic absorption and its flameless and cold vapor modifications, concentration by amalgamation and sample combustion.--Copyright 1975, Biological Abstracts, Inc.

METHODS OF INVESTIGATING PHYTOBENTHOS OF CONTINENTAL WATER BODIES, (IN RUSSIAN),
Akademiya Nauk SSSR, Novosibirsk. Central Siberian Botanical Garden.
G. D. Levadnaya.
Gidrobiol Zh 11(3); p 85-90, 1975.

Descriptors: *Benthos, *Biomass, *Algae, *Aquatic algae, Chlorophyll, Bodies of water, Bottom sediments, Silts, Sands, Cytological studies, *Pollutant identification
Identifiers: *Phytobenthos, USSR, Ob River, Enisei River.

A review is given of the literature on methods of quantitative evaluation of the biomass of algae, which can be expressed in dry, air-dry, ashless-dry and fresh weight; in the content of chlorophyll and biogenic elements; and in calories. The most convenient method of recording the biomass on soft bottom deposits (silts, silty sands) is the count-volume method: algae collected from a known area of the bottom are counted and knowing the average weight of the dominant species, the total biomass is determined. Data are given on the average weight of cells of the main forms of algae (24 spp.) of the Ob and Enisei rivers (USSR).--Copyright 1976, Biological Abstracts, Inc.

INSTRUMENTATION FOR FIELD STUDIES OF URBAN RUNOFF,
Canada Centre for Inland Waters, Burlington (Ontario)
J. Marsalek
Canada-Ontario Agreement on Great Lakes Water Quality, Research Report No. 42, Environmental Protection Service, Environment Canada, Ottawa, Canada, 1974, 82p., 27 fig., 7 tab, 36 ref,. 1 append. 73-3-12.

Descriptors: *Instrumentation, *Urban runoff, Precipitation(Atmospheric), Sewage, Waste water treatment, Flow, Sampling, Gauges, Measurement, *Monitoring, Pollutant identification, Water pollution sources
Identifiers: Sensors, Recorders.

Instrumentation and monitoring techniques for field studies of urban runoff are examined. In particular, the following types of instruments were studied: recording precipitation gauges; sewer flow measurement instruments; and, automatic wastewater samplers. After reviewing the literature and surveying the market, some of the promising instruments were acquired, tested in the laboratory and operated in the field for various time periods. Individual instruments are discussed with regard to their technical data, accuracy and reliability. Recommendations for the selection, interfacing and installation of the instruments are given. LEVELS OF ARSENIC AND SELENIUM IN THE GREAT LAKES REGION,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
W. J. Traversy, P. D. Goulden, Y. M. Sheikh, and J. R. Leacock.
Water Quality Branch, Scientific Series No 58, 1975. 18 p, 8 fig, 17 tab, 29 ref.

Descriptors: *Great Lakes, *Arsenicals(Pesticides), Industrial wastes, Water pollution, *Great Lakes Region, Rivers, Lakes, Water analysis, Sediments, Fish, Fallout, Rain, Toxins, Sampling, *Pollutant identification, Water pollution sources.
Identifiers: *Arsenic, *Selenium.

Arsenic and selenium were determined in water, sediments and fish samples from the international Great Lakes, in water samples from international rivers and selected rivers in Ontario and in precipitation samples from the Great Lakes region, to assess their present levels and to provide base-line data for future reference. Mean values for arsenic in lake waters varied from 0.23 micro g/l for Lake Superior to 0.91 micro g/l for Lake Ontario, and mean sediment values ranged from 2.03 micro g/g for Lake Superior to 3.20 micro g/g for Lake Erie. The mean arsenic fish value for lakes Erie and Ontario was 0.07 micro g/g. Analyses of waters from the St. Marys and St Lawrence rivers showed mean arsenic values of 0.37 micro g/l and 0.61 micro g/l, respectively, and the mean value of other rivers in Ontario was 0.26 micro g/l. The mean precipitation arsenic value was 0.72 micro g/l. Mean selenium values for lake waters were less than 0.1 micro g/l for all of the Great Lakes and mean sediment values ranged from 0.63 micro g/g for Lake Superior to 1.00 micro g/g for Lake Ontario. Mean fish values from lakes Erie and Ontario were 0.05 micro g/g and 0.06 micro g/g, respectively. The St. Marys and St Lawrence rivers showed mean selenium values of less than 0.1 micro g/l, as did other rivers tested in Ontario. The mean precipitation selenium value was 0.29 micro g/l. COMPUTERIZED SCHEME FOR THE IDENTIFICATION OF AEROMONADS AND MEMBERS OF THE FAMILY ENTEROBACTERIACEAE,
Canada Centre for Inland Waters, Burlington (Ontario).
W. E. Lowe.
Inland Waters Directorate Scientific Series No. 57, 1975, 33p., 2 fig., 7 tab, 31 ref., 2 append.

Descriptors: *Aeromonads, *Enteric bacteria, Classification, Computers, Aquatic bacteria, Mathematical models, Methodology, Testing, *Computer programs, Coliforms, *Pollutant identification
Identifiers: *Enterobacteriaceae.

A system is described which combines practical and theoretical concepts into a workable system for the routine and simultaneous identification of large numbers of Aeromonas isolates and members of the Family Enterobacteriaceae. The identification method is based on computerized determination of conditional probabilities of two state characters, using estimations of likelihood rather than Bayesian probability. The multipoint inoculation procedures used, coupled with small quantities of media in non-disposable racks and vials reduce the costs considerably below those of commercially available multi-test single inoculation systems. The reliability of the system, determined for a range of hospital isolates, approaches 90 percent, and with isolates from water the accuracy approaches 100 percent. (Environment Canada)
W77-02758

STUDY OF THE SOLUBILITY OF OIL IN WATER,
Ottawa Univ. (Ontario). Dept. of Civil Engineering.
B. C. Y. Lu, and J. Polak.
Technology Development Report EPS-4-EC-76-1, Environmental Protection Service, Environment Canada, Ottawa, Canada, February 1976, 25 p., 5 fig., 11 tab., 11 ref

Descriptors: *Oil, *Water analysis, *Oil-water interfaces, Solubility, Fuels, Time, Pollutant identification, Oil wastes.
Identifiers: Bunker oil, Crude oil, Removal rates(Oil).

Experiments were conducted to determine the total solubility of oil in water. Three oils were employed; Number 2 fuel oil, medium bunker fuel, and western crude oil. The total solubilities of these oils were determined by dissolution tests and by static equilibrium tests; both testing procedures attained similar results. The maximum solubilities and the lengths of time in which these were attained were of the following orders of magnitude; Number 2 fuel oil, 7.5 ppm, attained in 5 days; medium bunker fuel, 2.3 ppm, attained in 2 days; and western crude oil, 46 ppm, attained in 8 days. The rates of removal of the dissolved components from solution in water were also investigated. The time duration of removal was analagous to the time duration for the attainment of maximum concentration. Traces of soluble hydrocarbons were found to persist for at least 13 days after their introduction into solution. (Environment Canada)
W77-02765

PROCEDURE FOR EXAMINATION OF WATER AND SEDIMENT SAMPLES FOR TOTAL ASBESTOS FIBRE COUNT BY ELECTRON MICROSCOPY,
Canada Centre for Inland Waters, Burlington (Ontario).
M. R. Thompson.
Inland Waters Directorated Technical Bulletin No. 94, 1976, 4 p., 2 fig., 1 tab., 9 ref.

Descriptors: *Asbestos, *Water analysis, *Sediments, *Electron microscopy, *Lake Superior, Sampling, Lakes, Equipment, *Pollutant identification.
Identifiers: *Fibers(Asbestos), Fibre count(Asbestos).

In 1973, a major investigation of asbestos fibers in water and sediment samples of Lake Superior began at Canada Centre for Inland Waters. A procedure for obtaining total fibers per litre of water samples was developed. This report documents that procedure, describing problems encountered and suggested solutions, and outlining the mathematical equations for determining fibers per litre. (Environment Canada)

POLYCHLORINATED BIPHENYLS (PCB'S) IN MUNICIPAL WASTEWATERS: AN ASSESSMENT OF THE PROBLEM IN THE CANADIAN LOWER GREAT LAKES,
Environmental Protection Service, Burlington Ontario). Waste Water Technology Centre.
E. E. Shannon, F. J. Ludwig, and I. Valdmanis.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 49, 1976, 28 p., 4 fig., 5 tab., 17 ref., append. 73-3-8.

Descriptors: *Polychlorinated biphenyls, Municipal wastes, Waste water treatment, Sewage treatment, Aroclors, Sludge, Degradation(Decomposition), Cities, Industries, Aquatic environment, Canada, Separation techniques, Pollutant identification.
Identifiers: Ontario, Physical separation.

A survey of polychlorinated biphenyls (PCB's) concentrations in the raw wastewaters from 33 municipalities was carried out. In addition, detailed investigations of the fate of PCB's during conventional secondary treatment were performed at the Hamilton Wastewater Treatment Plant. PCB concentrations in raw wastewaters ranged from less than 0.1 to 1.8 ppb, with the industrial areas of Hamilton, Toronto and Windsor exhibiting the highest levels. Only the 1254 and 1260 Aroclors were detected in any of the wastewaters. The primary treatment facilities surveyed removed, on the average 50% of the PCB load, whereas the secondary plants averaged 66% removal. PCB concentrations in digested sludges ranged from 0.6 to 76.6 ppm (dry weight). PCB removal during wastewater treatment is largely by accumulation in the primary and/or waste activated sludge streams. There seemed to be little biodegradation. There are indications that multiple-hearth incineration may destroy the PCB's encountered in dewatered sludges. However, more experimental work is necessary to substantiate this observation. (Environment Canada)

APPLICATIONS OF DIRECT AQUEOUS INJECTION GAS CHROMATOGRAPHY AND FREEZE CONCENTRATION FOR THE DETERMINATION OF ORGANIC COMPOUNDS IN WATER AND WASTE WATERS,
Canada Centre for Inland Waters, Burlington (Ontario).
M. E. Fox.
American Society for Testing and Materials Special Technical Publication 573, p. 242-250, 1975. 6 fig., 1 tab., 9 ref.

Descriptors: *Organic compounds, *Analytical techniques, *Gas chromotography, Pollutants, Sewage effluents, Water pollution, *Pollutant identification, Water analysis.

The successful analysis of methanol and aircraft deicer (a 2:1 mixture of ethylene glycol plus propylene glycol with traces of other compounds) in wastewater and a preliminary attempt to analyze a pulp mill effluent plume in a water body are described. To detect methanol in sewage to less than 1 ppm, a porous polymer column packing material was chosen; when the column temperature was lowered to 70C the water response appeared as a very low flat-topped mound with the methanol appearing as a normal sharp peak on top of the mound. The duration of the water response for a 5 microliter injection was about 50-60 seconds and the low molecular weight organic compounds could be differentiated from methanol retention times. Higher molecular weight compounds were either retained in the removable injection port liner or eluted so slowly that significant baseline deflections were noted, thus producing results with little sample pretreatment, a speed of 50+ samples/hr, and sufficient precision. The aircraft deicer was analyzed at a 160C column temperature, when the two major components eluted together as a single peak, and could be reported as mgC/1. Freezing to offset the dilution of an organic effluent plume was limited to achievement of no more than a 15 X concentration due to high levels of inorganic salts. (Auen-Wisconsin)
W77-02809

A METHOD FOR THE DETERMINATION OF MERCURY IN SEDIMENTS BY THE AUTOMATED COLD VAPOR ATOMIC ABSORPTION TECHNIQUE AFTER DIGESTION,
Canada Centre for Inland Waters, Burlington (Ontario).
H. Agemian, and A. S. Y. Chau.
Analytica Chimica Acta, Vol. 75, p. 297-304, 1975. 2 fig., 2 tab., 25 ref.

Descriptors: *Mercury, *Analytical techniques, Sediment-water interfaces, Digestion, *Pollutant identification, Methodology, *Sediments.
Identifiers: Cold vapor mercury analysis, Atomic absorption techniques.

In order to determine the mercury content of a sample it is necessary to extract the inorganic mercury and to liberate mercury from organomercurials by oxidation of the organic matter because all forms of mercury introduced into the aqueous environment end up adsorbed on fine-grained particles, such as iron oxides, sulfide surfaces and on clay particles, and to be present as inorganic phosphorus complexes, in humate complexes, and as methyl- and dimethyl-mercury produced by microbial activity. A manual method for the extraction of inorganic mercury and the oxidation of organomercurials has been modified and incorporated into an automated procedure for the determination of mercury in sediments. The method includes digestion of the wet sediment with sulfuric and nitric acids followed by oxidation of the organomercurials with potassium permanganate and potassium persulfate. Errors caused by coprecipitation and adsorption of mercury on manganese dioxide are avoided by reduction of the dioxide with a solution of hydroxyammonium sulfate and sodium chloride. The mercury content in solution is determined by a cold vapor technique with tin(II) sulfate as a reductant in an automated system. This method can detect down to 10 ppb of mercury in sediment (based on 1 g samples) and can automatically handle 20 samples per hour after manual digestion. (Auen-Wisconsin)
W77-02811

NEW AUTOMATED COLORIMETRIC METHOD FOR THE DETERMINATION OF CHLORIDE USING CHROMOTROPIC ACID,
Canada Centre for Inland Waters, Burlington (Ontario).
B. K. Afghan, R. Leung, A. V. Kulkarni, and J. F. Ryan.
Analytical Chemistry, Vol. 47, p. 556-559, 1975. 4 fig., 1 tab., 9 ref.

Descriptors: *Chlorides, *Analytical techniques, *Colorimetry, Measurement, *Pollutant identification, Water analysis.

Under the experimental condition used during formaldehyde analysis, chloride ion catalyzed the conversion of nitrate to nitrite and the resultant nitrite reacted with chromotropic acid to produce strongly colored species. This triggered the development of a colorimetric method for chloride measurement in water in the range of 0.25-100 mg/l at the rate of 20 samples per hour. Variation of temperature and time of color development have a pronounced effect on the intensity of color production by the reaction of chloride, nitrate, and chromotropic acid. A maximum sensitivity was achieved using 25 mg/l of nitrate at 75C in a working range between 0.25-30 mg/l, but the range of calibration curve can be altered to cover a 1-100 mg/l range. The optimum concentration of chromotropic acid required to analyze chloride in the 1-100 mg/l range was 0.25%. No major and minor ions, or organic compounds normally found in water produced interference. All absorption measurements were carried out using a 505-nm narrow pass filter making it possible to cover a chloride concentration range between 0.25-100 mg/l. This method can be directly applied to the analysis of natural waters and possibly to waste waters. (Auen-Wisconsin)
W77-02812

CONCENTRATIONS OF COPPER, IRON, LEAD, NICKEL AND ZINC IN FRESHWATER ALGAL BLOOMS,
University Coll. of Swansea (Wales). Dept. of Botany and Microbiology.
D. R. Trollope, and B. Evans.
Environmental Pollution, Vol. 11, p. 109-116, 1976. 3 tab., 18 ref.

Descriptors: *Heavy metals, *Bioassay, *Algae, Absorption, Copper, Iron, Lead, Nickel, Zinc, Europe, Monitoring, Chlorophyta, Cyanophyta, Pollutant identification.
Identifiers: *Lower Swansea Valley(England), Bioconcentration, Xanthophyta.

The ability of freshwater algae to absorb and concentrate heavy metals was measured near zinc smelting wastes in the Lower Swansea Valley, England. The majority of the algae were filamentous and all were Chlorophyta except Tribonema (Xanthophyta) and Oscillatoria (Cyanophyta). Metal concentrations in algal tissue varied with genus and within a genus, e.g., the four Tribonema blooms exhibited three- to fourfold differences for copper, iron and lead and in the four Spirogyra concentrations varied from fivefold to twentyfold for all five metals. The large differences in the range of concentration factors exhibited within each algae group were apparent for all metals except lead where tenfold differences were present in the three algal groups. For zinc there was a linear correlation between water concentration and algal concentration. It was unclear whether differences observed for the other metals were due to differences in environmental conditions or to differences due to the nature of the algae. However, an examination of the four Tribonema blooms showed that their variation in metal content was likely due to a combination of environmental factors and the age of the algae. It may be possible to utilize freshwater algae as an assay tool for heavy metal concentrations as these algae are ubiquitous and some species tolerate wide variations in environmental conditions. (Auen-Wisconsin)
W77-02813

REX, A COMPUTER CONTROLLED ROBOT FOR IN SITU WATER QUALITY MONITORING,
Canada Centre for Inland Waters, Burlington (Ontario).
K. N. Birch.
American Society for Testing and Materials Special Technical Publication 573, p. 437-455, 1975. 6 fig., 1 tab., 8 ref.

Descriptors: *On-site data collections, *Water quality, *Monitoring, *Automatic control, Digital computers, Equipment, *Computer programs, Analytical techniques, *Pollutant identification.
Identifiers: Sensors, Robots.

A prototype computer controlled monitoring system using a relatively simple sensing head capable of performing a repertoire of analytical experiments in situ is described. The robot sensing head is the active portion of the remote station and includes all the electronic and mechanical hardware to decode and execute the commands from the computer. The sensing head was tested using an EAI 690 hybrid computer to simulate a central computer and telecommunications facility. The head consisted of a peristaltic pump, a servo positioned valve, an array of six electrodes (2 glass pH, 3 silver-silver chloride, and 1 gold micro-electrode) and a thermistor, along with buffer amplifiers and motor controllers to service these devices. A main feature is its design as a remote, computer peripheral, like a teletype, which understands up to 64 different commands, and which returns coded responses. Its in situ orientation makes the entire sensor head submersible and operable in depths to 100 m. A repertoire of programmed experiments showed how it could monitor temperature, pH, conductivity, dissolved oxygen, chloride ion, total carbon dioxide, total alkalinity, and a factor identified as 'other ions.' The system configuration is illustrated by a block diagram. Using the computer as the master control element is the major aspect of the system. (Auen-Wisconsin)
W77-02814

PROBLEMS IN THE MONITORING OF BIOMASS,
Canada Centre for Inland Waters, Burlington (Ontario).
N. H. F. Watson, G. F. Carpenter, and M. Munawar.
American Society for Testing and Materials, Special Technical Publication 573, p. 311-319, 1975. 4 fig., 1 tab., 11 ref.

Descriptors: *Measurement, *Biomass, *Sampling, Standing crops, Seston, Bioassay, Testing procedures, *Monitoring, Pollutant identification.

An effective approach to produce adequate biomass measures and which reports data in biomass as well as in numerical units is suggested. The method involves taking pairs of samples at each station, one as a vertical haul with a plankton net of sufficient diameter and length to ensure efficient straining of the water column; the second made to the same depth with an integrating water sampler. Integrated samples have been obtained to a 20 m depth. Measured portions of both samples are filtered on fiberglass (large zooplankton are removed from integrator filters), dried in a dessicator, and analyzed for ash-free dry weight or particulate carbon. A fraction of the integrator samples is passed through a sieve of the same mesh size as the plankton net, and each fraction dried to estimate net and nannoplankton concentrations. Biomass is expressed as concentrations (per cubic meter), although net and integrator dimensions allow calculation of areal abundance (per square meter) unit as well. Addition of the nannoplankton values to the plankton net biomass gives total biomass, and subtraction of net phytoplankton values from the plankton net value produces a zooplankton biomass value. This procedure assures that a sufficiently large sample is taken to overcome the effects of horizontal and vertical microdistribution of planktonic organisms and subsampling and analysis procedures allow absolute values of total biomass to be obtained. (Auen-Wisconsin)

TROPHIC CLASSIFICATION OF LAKES USING LANDSAT-1 (ERTS-1) MULTISPECTRAL SCANNER DATA,
Environmental Research Lab., Corvallis, Oreg.
D. H. P. Boland.
EPA-600/3-76-037. April, 1976. 244 p. 38 fig., 33 tab., 211 ref., 18 append. NAS7-100 EZ-608770.

Descriptors: *Trophic level, *Remote sensing, *Satellites(Artificial), *Eutrophication, Photometry, Spectroscopy, Surveys, Statistical methods, Regression analysis, Lakes, Limnology, Great Lakes region, Pollutant identification, Classification.
Identifiers: *Lake classification, *Multispectral scanning, Cluster analysis, LANDSAT, Earth Resources Technology Satellite(ERTS).

LANDSAT-1 (ERTS-1) multispectral scanning data of 100 lakes in Minnesota, Wisconsin, Michigan and New York was evaluated. Principal components analysis was used to derive a multivariate trophic state index using six trophic indicators. Trophic state, defined in the study by lake position on the index, is predicted using multispectral scanning color regression statistical models. Utility of the scanning technique is most apparent when the seasonal contrasts between lakes at different points on the trophic scale are at maximum. It is concluded that remote sensing by earth satellite can be used to provide much useful data in trophic classification studies of lakes. Maximum benefit from the satellites can be derived through use of the data on their computer-compatible tapes in conjunction with automatic image processing techniques. While remote sensing is an effective tool for lake enumeration and lake surface area estimation, systematic time-series data gathering is difficult if not impossible because of excessive cloud cover on many passover dates. However, the method is useful as a supplemental data source in lake surveying, especially in situations involving large lakes and/or large numbers of lakes. (Harris-Wisconsin)

ENVIRONMENTAL INVENTORY AND ASSESSMENT OF NAVIGATION POOLS 24, 25, 26, UPPER MISSISSIPPI AND LOWER ILLINOIS RIVERS: AN AQUATIC ANALYSIS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Environmental Effects Lab.
W. K. Colbert, J. H. Johnson, J. E. Scott, and R. C. Solomon.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A 021 750, Price codes: A16 in paper copy, A01 in microfiche. Report No. Y-75-2, December 1975. 368 p. 33 fig., 35 tab., 4 maps, 95 ref., 10 append.

Descriptors: *Mississippi River, *Basic data collections, *Sampling, *Monitoring, *Water quality, Aquatic habitats, Environmental effects, Dams, Dikes, Dredging, Channel improvement, Operation and maintenance, Sediments, Turbidity, Phenols, Heavy metals, Nutrients, Temperature, Suspended solids, Alkalinity, Chemical oxygen demand, Benthos, Fish, Hydrogen ion concentration, Dissolved oxygen, Phytoplankton, Zooplankton, Chlorinated hydrocarbon pesticides, Navigation, Census.
Identifiers: *Illinois River, Navigation Pool 24, Navigation Pool 25, Navigation Pool 26.

Physical, chemical, and biological components of the aquatic system in Pools 24, 25, and 26 on the Upper Mississippi and Lower Illinois Rivers are described and compared at high and average flow periods, and the effects of operation and maintenance of the 9 ft channel on the aquatic ecosystems were assessed. Four major habitat types, main channel, side channel, river border areas, and areas downstream of dikes, were sampled, consisting of 70 sites at 19 transects. Water and sediment samples were collected for physical and chemical characterization. In situ measurements were made for dissolved oxygen, temperature, total alkalinity, pH, turbidity, and settleable solids. Laboratory analyses were made for chemical oxygen demand, phenols, heavy metals, selected nutrients, and chlorinated hydrocarbons. Benthic organisms, drift organisms, phytoplankton, and zooplankton were collected from both rivers, but fish were only collected from the Illinois River. Variance and mean comparison statistical analyses were used to test for differences between flow periods, rivers, and among habitats. The environmental impacts of operation and maintenance activities such as the stabilization of the water levels, destruction of benthic communities by dredging, and disposal of dredged material alongside the channel, was also discussed. VIRONMENTAL STRESSOR MATRIX STEM FOR EARLY WARNING,
ttelle Columbus Labs., Ohio.
L. Morrison.
Papers of a Seminar on Early Warning Systems Toxic Substances, held on January 30-Februa-1, 1974, at Battelle Research Center, Seattle, shington (EPA-560/1-75-003, July 1975), p. 175-. 7 fig., 3 tab., 8 ref.

scriptors: *Warning systems, *Analytical hniques, *Environmental effects, *Toxins, oxicity, Poisons, Public health, Monitoring, stems analysis, Hazards, Pollutant identifica-n, Path of pollutants, Chemicals.
ntifiers: *Evaluation systems, *Environmental essors, Disease detection, Public health screen-.

mework description is given of the three basic ments of an early warning system for identifica-n of toxic substances: surveillance, assessment d action. The system deals with environmental essors--the agents or factors of concern reduced their simplest terms or their most fundamental t. Examples are specific ketones, biphenyls, halides and oxides among the organic chemical compounds, along with noise, radiation, inhalants, foods and bacteria among the biological and physical environmental stress. An environmental stressor matrix traces an agent from its several sources along all its environmental pathways through various receptors to determine its effect on man. The environmental stressor matrix arrays stressors against sources, transport paths, and effects classifications. Surveillance is used to identify hazards by monitoring toxicants on the market, screening technical literature and comparing partial results at scientific meetings. Assessment attempts to verify that cause and effect relationships exist and a valid pollution chain diagram can be constructed to deal with a given stressor. As part of this step, quantitative modeling provides problem magnitude estimation. Finally, action implies corrective activities by industry, government and the scientific community. AN INCIDENT OF INDUSTRIALLY RELATED TOXIC PERIPHERAL NEUROPATHY,
National Inst. for Occupational Safety and Health, Cincinnati, Ohio.
B. F. Craft.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washington (EPA-560/1-75-003, July 1975), p. 45-50. 4 ref.

Descriptors: *Industrial plants, *Epidemiology, Diseases, Human pathology, Toxicity, Toxins, Public health, Poisons, Monitoring, Chemicals.
Identifiers: *Methylbutyl ketone, *Peripheral neuropathy, Organic solvents(Chemicals).

The need for systems of early warning for toxicity is illustrated by early results of a study which showed that workers in a fabrics coating plant suffered from toxic peripheral neuropathy in which an organic solvent used in the printing operation--methylbutyl ketone (MBK)--was highly suspect as the etiological agent. Investigation revealed that other chemicals commonly known to produce a toxic neuropathy, such as hexane, acrylamide, trio-cresyl-phosphate and thallium, had not been in use in the plant for more than 10 years. The only significant change in operation was a substitution of MBK for another organic solvent. The first symptoms of the disease appeared 16 months after the substitution began on a partial basis. The use of a large number of chemical compounds in the plant, many for which there was little toxicological information, markedly complicated the assessment of the problem. Most such studies, furthermore, address a single-agent concept whereas workmen in industrial situations are often exposed to a variety of toxic compounds and other chemical agents whose synergistic or additive properties may well lead to hitherto-unknown effects. ESTABLISHING ENVIRONMENTAL PRIORITIES FOR SYNTHETIC ORGANIC CHEMICALS: FOCUSING ON THE NEXT PCBS,
Syracuse Univ. Research Corp., N. Y.
P. H. Howard.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washington (EPA-560/1-75-003, July 1975), p. 51-65. 3 tab., 21 ref. 68-01-2202.

Descriptors: *Chemicals, *Toxins, *Toxicity, *Epidemiology, *Analytical techniques, Public health, Poisons, Polychlorinated biphenyls, Industrial production, Path of pollutants, Organic compounds, Priorities, Hazards.
Identifiers: *Priority-ranking techniques, Chlorinated napthalenes, Silicones, Fluorocarbons, Benzenecarboxylates, Chlorophenols.

Exact toxic effects are known for only a small proportion of the more than 9000 synthetic organic chemicals produced in commercial quantities in the United States. Because detailed studies to evaluate chronic toxicity costs an estimated $100,000 to $2000,000 per chemical, it is unlikely that all of the 300 to 500 new chemicals annually introduced for commercial use can receive more than a cursory evaluation. Therefore, a procedure is necessary whereby such testing can be priority-ranked for each chemical in terms of readily described or projected parameter. These would include environmental contamination potential, environmental stability and probable environmental distribution. Marketing information, for example, would provide insight into the probable route and destination in the environment of such contaminants as PCBs. Once the fate of such pollution were estimated, the stability parameter could be used to estimate the likely degradation or alteration mechanism and action time for the compound. Finally, an estimate could be made as to where the chemical might concentrate to dangerous levels in the environment. Examples of organic chemical hazard assessment are given for five groups of chemicals; chlorinated napthalenes, fluorocarbons, benzenepolycarboxylates and chlorophenols. REVIEW OF HEALTH/ENVIRONMENTAL SYSTEMS WITH POTENTIAL EARLY WARNING APPLICATIONS,
Battelle-Columbus Labs., Ohio.
T. J. Thomas, and J. E. Flinn.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washington (EPA-560/1-75-003, July 1975), p. 128-150. 2 fig., 1 tab., 7 ref.

Descriptors: *Pollutant identification, *Chemicals, *Chemicals, *Chemical analysis, *Toxins, *Toxicity, *Indicators, *Public health, Analytical techniques, Analysis, Evaluation, Poisons.
Identifiers: *Problem identification and ranking, Prioritization systems, Evaluation systems.

Although a variety of methodologies have been developed which might be utilized to identify and priority-rank chemicals for their health and environmental effects, the Environmental Protection Agency's Office of Toxic Substances (OTS) finds that none of the methodologies have a frame of reference broad enough to select, assess and prioritize in a sufficiently comprehensive manner. However, many of the methodologies could represent important adjuncts to any OTS efforts to monitor public exposure to various chemicals. Three types of identification/ranking systems are: (1) those which provide information repositories for chemical toxicity data; (2) those designed to identify chemical substances before the time of general public exposure; and (3) those which provide post-exposure surveillance. Each of these can be further subscategorized as those which basically seek to identify new or unrecognized chemical stressors and those which seek to evaluate the hazard of a recognized stressor. Finally identification/ranking systems differ according to the way in which a candidate list of substances for evaluation is identified: (1) systematic literature scanning; (2) licensing; (3) test protocols; (4) expert panels; (5) data base sampling, accumulation or analysis; and (6) incident reports. Elements of these existing systems could be used to conceptualize three potential designs for a prioritization/classification scheme of sufficient comprehensiveness. A RESEARCH PROGRAM TO ACQUIRE AND ANALYZE INFORMATION ON CHEMICALS THAT IMPACT ON MAN AND HIS ENVIRONMENT,
Stanford Research Inst., Menlo Park, Calif.
A. A. McGee, and K. E. McCaleb.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washington (EPA-560/1-75-003, July 1975), p. 151-153.

Descriptors: *Chemicals, *Public health, *Toxins, *Toxicity, Analytical techniques, Analysis, Evaluation, Poisons, Diseases, Pollutant identification.
Identifiers: *Carcinogenic chemicals, *Cancer-inducing substances, *Evaluation systems, Problem identification and ranking.

A data collection and analysis system for carcinogenic chemicals screening has been developed to aid the National Cancer Institute Carcinogenesis Program in selecting chemicals for testing. The system utilizes the current carcinogenic information data base which lists 3,200 chemicals categorized as intentional food additives, pesticide residues in food, proprietary drugs, prescription drugs, cosmetics, air pollutats, water pollutants, soaps and detergents and trade sales paints. These categories are subdivided into 900 product types which represent 18,000 chemical product combinations. Computer-readable data contain the following information: product name, quantity available for exposure, exposure routes (oral, dermal, respiratory and parenteral), exposure factor by route, CAS number and name, potency, (percentage of chemical) in each product, degree of uncertainty accociated with quantitative data and references to data sources. In addition to the information on the exposure categories, another data bank of 25,000 chemicals has been developed, drawn from 18 recognized information sources. Description is also given of a computerized chemical classification scheme which allows a node assignment to be made for each of the chemicals for which exposure estimates have been made. The availability of additional biological data in the future may make it possible to make informed guesses as to a molecule's carcinogenic potential based on the classification scheme. NATIONAL CANCER INSTITUTE PROGRAM OF CANCER SURVEILLANCE, EPIDEMIOLOGY AND END RESULTS REPORTING (SEER PROGRAM),
National Cancer Inst., Bethesda, Md. Biometry Branch.
J. L. Murray, and S. J. Cutler.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washington (EPA-560/1-75-003, July 1975), p. 154-166. 5 fig., 2 tab., 4 ref.

Descriptors: *Epidemiology, *Public health, *Diseases, Toxins, Toxicity, Analysis, Analytical techniques, Poisons.
Identifiers: *Evaluation systems, Carcinogenic chemicals, Cancer-inducing substances.

The program is described through which information is provided on long-term trends in cancer occurrence in the United States, on occurrence variations in various population groups and geographic areas, new developments in diagnostic and treatment practices and changing trends in the effects of the disease among patients. The overall effort is focused on developing means to accurately assess cancer risks in groups and individuals and on evaluating the presence, extent and probable course of existing cancers. The SEER program involves two types of participants. One type consists of population-based tumor registries which attempt to obtain information on every newly-diagnosed cancer case and cancer-related deaths among populations of a defined size. The second type includes epidemiology research and training centers. Current SEER program participants include nine contract agencies whose study areas cover five whole states and parts of four others, with population bases of almost 19 million. According to present knowledge, many types of cancer are associated with environmental factors such as pollutants, and a majority of cancer deaths are attributable to them. EARLY-WARNING SYSTEM FOR TOXIC SUBSTANCES: HUMAN HEALTH ASPECTS,
National Environmental Research Center, Research Triangle Park, N.C.
A. V. Colucci, and P. E. Brubaker.
In: Papers of a Seminar on Early Warning Systems for Toxic Substances, held on January 30-February 1, 1974, at Battelle Research Center, Seattle, Washington (EPA-560/1-75-003, July 1975), p 5-12.

Descriptors: *Warning systems, *Forecasting, *Public health, *Epidemiology, *Human diseases, *Toxicity, *Toxins, *Pollutants, Social aspects, Human pathology, Poisons, Diseases.
Identifiers: *Public health screening, *Disease detection, *Disease screening.

Clinical medicine and epidemiology supported by environmental monitoring, biochemical and physiological research programs are all multidisciplinary elements of an approach needed to overcome difficulties of studying the human health effects of environmental pollutants. An overview of current early warning approaches shows that many existing epidemiological and clinical studies mounted by government and private industry have significant similarities. EPA's Community Health and Environmental Surveillance System and Community Pesticide Studies, Clinical Laboratory Evaluation and Assessment of Noxious Substances, Assessment of Cellular Toxicity and Interactions of Noxious Substances, National Environmental Banking System, along with programs sponsored by the Department of Health, Education and Welfare, the National Institute of Occupational Safety and Health, the Food and Drug Administration and the National Institute of Environmental Health Sciences, are currently used to predict changes in trends of existing pollutants. Such programs could be expanded into an early warning system by broadening the scope of pollutant monitoring and exposure and by improving health information gathering. One prototype of an early warning system is the integrated effort being developed by the Kaiser-Permanente Program now operative in fi western states, in which an average of 15 bas screening procedures are used. A LABORATORY MODEL ECOSYSTEM AS A ELEMENT IN EARLY-WARNING SYSTEM FOR TOXIC SUBSTANCES,
Illinois Univ. at Urbana-Champaign. Inst. for E vironmental Studies.
R. L. Metcalf.
In: Papers of a Seminar on Early Warning Syste for Toxic Substances, held on January 30-Febr ry 1, 1974, at Battelle Research Center, Seatt Washington (EPA-560/1-75-003, July 1975), p 6 81. 3 fig, 4 tab, 18 ref. EP-R-802022.

Descriptors: *Laboratory tests, *Tracki techniques, *Marking techniques, *Radiochemi analysis, *Toxins, *Toxicity, Analyti techniques, Tracers, Path of pollutan Biodegradation, Chromatography, Water pol tion, Poisons, Industrial wastes, Organic co pounds, Pesticides, Chemicals, Persistence.
Identifiers: Radioisotope labeling

A laboratory model ecosystem for evaluat micropollutant potentialities of a variety synthetic organic compounds, previou described by the author in other literature, off three major uses: (1) Screening new pesticides toxic effects to a number of organisms in the vironment, to determine degradation pathw and to characterize bioaccumulation biodegradability, (2) evaluating suitability of v ous pesticides for specific uses involving envir mental contamination; and (3) evaluating the po tion potential of various synthetic chemicals wh may enter the aquatic environment as trace c taminants. The model ecosystem is based on of radiolabeled molecules which permits tracing parent compounds and degradation produ through various organisms and food chains which facilitates quantitative determination amounts stored in various organisms. Instructi are given for construction of replicas of the labo tory model ecosystem, which involve use o glass aquarium containing a sloping shelf washed white sand, filled with water and see with plankton and sorghum seeds, the whole which is then subject to application by radiolabeled pesticides. Results and evaluati are given for laboratory tests of various pestici using the method. (See also W77-02835) (Har Wisconsin)

LANDSCAPE GEOCHEMISTRY AND VIRONMENTAL PROBLEMS,
Brock Univ., St. Catharines (Ontario). Dept Geological Sciences.
J. A. C. Fortescue.
In: Papers of a Seminar on Early Warning Syst for Toxic Substances, held on January 30-Feb ry 1, 1974, at Battelle Research Center, Sea Washington (EPA-560/1-75-003, July 1975), p 34. 11 fig, 21 ref.

Descriptors: *Monitoring, *Warning syste *Geochemistry, *Soil chemistry, *Soil analy *Public health, Trace elements, Analyt techniques, Toxicity, Water quality, Poisons, eases, Toxins.

Geochemistry, especially its lithospheric aspe might provide early warnings of toxic materia the environment, if research is applied in a us frame-of-reference. Three approach levels sh be categorized: a 'grand strategic' level which cludes broad generalizations upon w geochemistry is based; a 'strategic' level whic volves concepts associated with the landsc aspects of geochemistry, and a 'tactical' which is concerned only with the descriptio examples of applied landscape geochemistry

solving specific environmental problems. Reference is made to five examples of tactical-level investigations from which strategic and even grand-strategic generalizations might be drawn in application to toxicity studies: (1) distribution patterns of aluminum and lead in a forested landscape area; (2) effects on copper, zinc, lead and nickel uptakes by changes in the growth rate of certain forest trees brought about by an attack by the forest tent caterpillar during four growing seasons; (3) using lake sediment cores to detect human effects on the chemistry of the environment; (4) using stream sediments to detect natural and man-made variations in the chemistry of drainage basins; and (5) using stream sediments to locate an area characterized by molybdenum-induced copper deficiencies in cattle. CONTROL AND MONITOR INSTRUMENTATION FOR MUST WATER PROCESSING ELEMENT, FINAL REPORT,
Life Systems, Inc., Cleveland, Ohio.
G. G. See, K. K. Kacholia, and R. A. Wynveen.
Available from the National Technical Information Service, Springfield, VA 22161 as AD/A-018 156, Price codes: A07 in paper copy, A01 in microfiche. Report LSI ER-242-6, June 1975, 123 p, 37 fig, 32 tab, 22 ref. DADA 17-73-C-3163.

Descriptors: Treatment, *Waste treatment, *Water quality, *Waste water treatment, Management, Instrumentation, Monitoring, Water quality control.
Identifiers: *Medical Unit Self-Contained Trasportable, *MUST Water Processing Elements.

The evaluation program was primarily directed toward monitor instrumentation with secondary considerations given to its impact on control instrumentation. Areas of emphasis were survey of proper control and monitor instrumentation for the unit processes in the MUST WPE and the integrated system, conducting a trade-off analysis between spectator-analyzed performance data and various levels of automatic analysis, evaluating potable water quality monitoring requirements, and preparing a comparison of instrumentation alternatives. Suggestions which incorporate specific maintainability and reliability features into the WPE design include sensor redundancy, performance trend, and fault analysis, and design of components as Line Replaceable Units. ENVIRONMENTAL MEASUREMENTS OF AIR AND WATER QUALITY,
California Univ., Berkeley, Lawrence Berkeley Lab.
D. A. Mack.
(1975). 12 p, 6 tab, 2 fig, 17 ref.

Descriptors: *Water quality, Environment sanitation, *Water pollution, Analytical techniques, Measurement, *Monitoring, Spectrophotometry, Spectroscopy, *Pollutant identification, *Air pollution, Gas chromatography.

The paper lists the most prevalent air and water pollutants, notes typical levels encountered in background and urban concentrations and examines the methods presently employed in their analysis. Water quality analysis deals primarily with measurement of inorganic chemicals, metals, and organic chemicals, mainly pesticides. Atomic absorption spectrophotometry is identified as the chief method for measuring the metal content of water samples. Gas chromatography is routinely employed in pesticide analysis. Categories for improved water monitoring include improved ion-selective and gas membrane electrodes for a number of ions and gases, development of atomic absorption spectrophotometers with improved furnace techniques, and the use of an inductively coupled plasma in emission spectroscopy which may allow multi-element capability at ambient levels. MEASUREMENTS OF POLYCHLORINATED BIPHENYL (PCB) IN WATER, SEDIMENTS, AND ORGANISMS OF TWO RIVERS IN HIROSHIMA PREFECTURE, (IN JAPANESE),
Hiroshima Univ. (Japan). Dept. of Fisheries; and Hiroshima Univ. (Japan). Faculty of Fisheries and Animal Husbandry.
H. Nakagawa, M. Kayama, and E. Ariyoshi.
J Fac Fish Anim Husb Hiroshima Univ. 14(2), p 253-259, 1975.

Descriptors: *Polychlorinated biphenyls, Sediments, Rivers, Asia, Measurement, Pollutant identification, Carp, Snails, Mullets, Distribution patterns, Path of pollutants.
Identifiers: Hiroshima, Japan, Mullet.

In the Ashida river and Hironishiohkawa of Hiroshima Prefecture, Japan, PCB water contents, sediments and aquatic organisms were detected. Not all the water samples contained PCB. PCB contents in fish (carp, mullet) and shellfish (snails) in the Ashida river reached 0.01 and 0.24 mg/kg. The PCB distribution pattern in different grain-sized sediments in both rivers indicates that PCB was distributed mostly in smaller grain-size sediments. Analysis of PCB in sediments should take special account of grain size.--Copyright 1976, Biological Abstracts, Inc.

IDENTIFICATION OF ACID-CONTAINING FRACTION OF ODORANTS OF NATURAL WATER, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Inst. of Colloidal Chemistry and Water.
L. A. Mel'nichenko, A. T. Pilipenko, and I. T. Goronovskii.
Gidrobiol Zh 11(6), p 86-90, 1975.

Descriptors: Acids, Algae, *Cyanophyta, *Eutrophication, *Organic acids, *Pollutant identification, *Gas chromatography, *Spectroscopy, Odor.
Identifiers: Aphanizomenon-flos-aquae, Fatty acids, Microcystis-aeruginosa.

The role of organic acids in the formation of persistent odors of natural water during the 'bloom' period of blue-green algae (predominantly Microcystis aeruginosa and Aphanizomenon flos-aquae) was investigated, and attempts were made to identify them by gas-chromatography and IR spectroscopy. The acid composition of natural waters during the 'bloom' period is extremely variable. Among the odorants were saturated and unsaturated fatty acids as components of complex volatile products.--Copyright 1976, Biological Abstracts, Inc.

STUDY OF A RELATIONSHIP BETWEEN CHEMICAL AND BACTERIOLOGICAL POLLUTION IN THE COASTAL ZONES, (IN FRENCH),
CEA Centre de Pierrelatte (France).
M. Archimbaud, and C. Trouve.
Water Research 10(3), p 225-229, 1976.

Descriptors: Water pollution, Bacteria, Chemicals, Coasts, *Pollutant identification, Environment, *Sampling.
Identifiers: Bacteriological studies, Chemical studies, Coastal zones, *France.

In the places and circumstances where samples were taken (France) there is a clear connection between chemical and bacteriological pollution. The zone of uncertainty still surrounding close to 1/3 of the samples can be reduced by a complementary study. This could pinpoint the meteorological and environmental parameters not yet studied. Bacteriological studies will still be needed after chemical studies are made. The latter will serve as a framework for preventive action.--Copyright 1976, Biological Abstracts, Inc.

METHODS OF BALANCING AND CALCULATING THE O2 BALANCE OF THE MIDDLE COURSE OF THE SAALE RIVER, (IN GERMAN),
S. J. Casper, and W. Schoenborn.
Limnologica 10(1), p 191-195, 1976.

Descriptors: *Oxygen requirements, Biochemical oxygen demand, Methodology, Measurement, Phytoplankton, Periphyton, Oxygen demand, Rivers, Pollutant identification.
Identifiers: *Saale River(E. Germany).

The biogenic (phytoplanktonic, periphytic) and physical (atmospheric) O2 production and the biochemical O2 requirement of 2 sections of the river, between Eichicht and Fischersdorf and between Rothenstein and Grossheringen (East Germany), were balanced. Physical O2 production

determines O2 balance. The O2 production of the phytoplankton became more significant and the percentage of the physical O2 production diminished as the lowland characteristics of the river became more pronounced. The Boehnke (1965) method proved practical in calculating changes in O2 content.--Copyright 1976. Biological Abstracts, Inc.

DETECTION OF PATHOGENIC LEPTOSPIRES IN EFFLUENT AND SEWAGE SLUDGE FROM LARGE PIGGERIES, (IN GERMAN),
Institutul Agronomic din Timisorara (Rumania). Faculty of Veterinary Medicine.
R. M. Minzat, and V. Tomescu.
Arch Exp Veterinaermed 29(4), p 557-562, 1975.

Descriptors: *Farm wastes, *Sewage effluents, *Water pollution sources, *Sludge, *Sewage bacteria, Hazards, Cultures, Sewage treatment, Pathogenic bacteria, Hogs, *Pollutant identification.
Identifiers: Leptospira pomona, Leptospira tarassovi, *Leptospires, Piggeries

Sewage effluent and sludge from the purification plant of 8 large piggeries was examined for the presence of pathogenic leptospires. 43.1% of effluent samples were contaminated with Leptospira pomona and L. tarassovi, and 33 strains of L. pomona and 3 mixed cultures of L. pomona and L. tarassovi were obtained. The isolated strains were pathogenic by experimental infection of guineapigs, rabbits and pregnant and non-pregnant sows. The average survival period of pathogenic leptospires in sewage effluent was 24-48 h, with a maximum of 96 h. Leptospires were killed within 24 h in decanted sludge, due to its strong acidity. Water pollution by pathogenic leptospires by way of untreated sewage from piggeries poses a risk of an epidemic among persons bathing in contaminated surface waters.

STANDARD TEST FISH DEVELOPMENT. PART I. FAT-HEAD MINNOWS (PIMEPHALES PROMELAS) AND GOLDFISH (CARASSIUS AURATUS) AS STANDARD FISH IN BIOASSAYS AND THEIR REACTION TO POTENTIAL REFERENCE TOXICANTS.
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries and Wildlife.
I. R. Adelman, and L. L. Smith, Jr.
Environmental Protection Agency, Ecological Research Series, Report EPA-600/3-76-061a, July 1976. 76 p, 23 tab, 4 fig, 24 ref

Descriptors: *Methodology, *Toxicity, *Bioassay, Fish, *Chromium, *Sodium chloride, Pesticides, Laboratory animals, *Laboratory tests, *Water pollution effects, Herbicides, Metals, Life cycles, Growth stage, Freshwater fish, *Minnows, *Pollutant identification.
Identifiers: *Goldfish, Guthion, Acute toxicity, *Fathead minnows, Hexavalent chromium, Pentachlorophenol, Reference toxicant

Fathead minnows and goldfish were compared for variability of LC50's with four toxicants as a means of determining their suitability as a standard bioassay fish. Acute bioassays with sodium chloride, penta-chlorophenol, hexavalent chromium and Guthion (R) were conducted with both species; and results were reported as toxicity curves as well as LC50's at various times. Both species showed similar variability of bioassay results. Bioassays of pentachlorophenol were conducted with both species to determine the effect of testing different sized fish at the same age or testing different aged fish. Size selection of fish within the ranges tested is unnecessary since differences in LC50's were small. Since age of fathead minnows did not affect the LC50's after 24 hours, use of younger fish would allow smaller bioassay chambers or more fish per chamber. Since goldfish could not be induced to complete a life cycle in the laboratory in less than one year, fathead minnows were superior as a standard species because of their smaller size and their utility in complete life cycle tests. On the basis of seven criteria, sodium chloride was superior for use as a reference toxicant with pentachlorophenol a close second choice. (See also W77-03003) (Katz)
W77-03002

STANDARD TEST FISH DEVELOPMENT. PART II: CHRONIC TOXICITY OF GUTHION TO THE FATHEAD MINNOW (PIMEPHALES PROMELAS REFINESQUE),
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries and Wildlife.
L. R. Adelman, and L. L. Smith, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 785, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Agency, Ecological Research Series, Report EPA 600/3-76-061b, July, 1976. 22 p, 5 tab, 9 ref

Descriptors: *Bioassay, *Minnows, *Toxicity, *Mortality, Laboratory animals, Laboratory tests, *Water pollution effects, Freshwater fish, *Methodology, Water quality, Growth stages, Life cycles, Statistical methods, *Pollutant identification.
Identifiers: *Guthion(R), *Chronic toxicity, *Application factor, Maximum acceptable toxicant concentration, *Fathead minnows

Three chronic bioassays of Guthion(R) were conducted with fathead minnows. All tests were begun with eggs and the longest lasted 20 days after termination of spawning, a total of 250 days. Parameters measured were survival, growth, fecundity, and growth and survival of second generation fry and eggs. The most sensitive criteria for effect of the toxicant was fecundity. The maximum acceptable toxicant concentration was between 0.33 and 0.51 ug/liter Guthion(R), and the application factor was between .0017 and .0027 based on a soft water acute and a hard water chronic bioassay. ANALYSIS AND GC-MS CHARACTERIZATION OF TOXAPHENE IN FISH AND WATER.
Fish and Wildlife Service, Columbia, Mo. Fish-Pesticide Research Lab.
D. I. Stalling, and J. N. Huckins.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 773, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency, Ecological Research Series, Report EPA-600/3-76-076, August 1976. 42 p, 2 tab, 19 fig, 12 ref

Descriptors: *Brook trout, *Pesticides, *Insecticides, *Chlorinated hydrocarbon pesticides, Chromatography, *Analytical techniques, *Gas chromatography, *Mass spectrometry, Methodology, *Water quality, *Path of pollutants, *Pollutant identification.
Identifiers: *Toxaphene, Polyurethane foam, Gel permeation chromatography, Silicic acid chromatography, *Multicomponent toxaphene residues, Electron impact mass spectrometry, Chemical ionization

Sensitive methods for the detection and identification of toxaphene in water and fish were described. Polyurethane foam, gel permeation and silicic acid chromatography were utilized to permit accurate quantitation of multi-component toxaphene residues. A method for characterization of changes in isomer composition of toxaphene residues in fish was reported. The chemical composition of toxaphene was examined by electron impact and chemical ionization mass spectrometry. Chemical ionization gas chromatography-mass spectrometry was particularly applicable to the analysis and confirmation of toxaphene residues in environmental samples. (Katz)
W77-03005

CONTENT OF LITHIUM, URANIUM AND THORIUM IN MINERAL SPRINGS OF THE NAKHICHEVAN ASSR, (IN RUSSIAN),
A. I. Baeva, E. A. Mugalinskaya, and A. B. Akhundova
Izv. Adka Nauk Az Ssr Ser Biol Nauk 2, p 73-77, 1975.

Descriptors: *Mineral water, *Springs, *Solutes, *Bottom sediments, Chemical properties, *Pollutant identification.
Identifiers: Azerbaijan SSR, Balneology, *Lithium, Nakhichevan ASSR, *Thorium, *Uranium, USSR, Badamly, Sirba, Darydag.

Data are presented on the content of Li, U and Th in water and bottom deposits of 3 groups (Badamly, Sirba and Darydag) of mineral springs in the Nakhichevan ASSR (Azerbaijan SSR, USSR), showing that the content of these elements does not exceed the maximum allowable concentrations of soluble compounds of these elements in water. The mineral springs of the Darydag group had the maximum indices with respect to Li, U and Th. This is probably the cause of the high balneological effect (on humans) of the mineral water of these springs. Of the indicated elements, U has a relatively high tendency to accumulate in the bottom deposits of the springs.--Copyright 1976, Biological Abstracts, Inc.
W77-03016

THIN-LAYER CHROMATOGRAPHIC DETERMINATION OF ANTHIO AND BUTYPHOS IN WATER, (IN RUSSIAN),
Uzbekskii Nauchno-Issledovatelskii Institut Sanitarii, Gigieny i Profzabolevanii, Tashkent (USSR).
N. G. Popova, Yu. U. Khasanov, and T. B. Muzykantova.
Gig Sanit 6, p 50-51, 1975.

Descriptors: *Pesticides, *Defoliants, *Pollutant identification, *Separation techniques, *Water pollution sources, Testing, Sampling, *Chromatography, *Pesticide residues.
Identifiers: Anthio, Butyphos, USSR, Thin layer chromatography.

The methods for determining the pesticide anthio (active principle 0,0-dimethyl-S,W-methyl-(N-formycarbamoylmethyl)phosphorodithioate) and cotton defoliant butyphos (S,S,S,-tributyl phosphorotrithioate) are based on their separation and quantitative determination in a thin layer of silica gel. The zones of localization of both preparations are detected by a mixture of solutions of bromphenol blue and silver nitrate. The quantity of the preparations is established by a visual comparison of the staining intensity and spot sizes of the sample and standard solutions. The sensitivity of the determination is 0.05 mg/l.

CHLORINATED HYDROCARBONS IN CETACEANS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
A. G. Taruski, C. E. Olney, and H. E. Winn.
Journal of the Fisheries Research Board of Canada, Vol. 32, p. 2205-2209, 1975. 2 tab, 27 ref.

Descriptors: *Path of pollutants, *Chlorinated hydrocarbon pesticides, *DDT, *Polychlorinated biphenyls, *Pesticide residues, *Dieldrin, Marine animals, Pesticides, Gas chromatography, Absorption, Mammals, *Pollutant identification.
Identifiers: *Cetaceans, *Whales, *Dolphins, *Chlordane.

DDT, PCB's, chlordane and dieldrin levels were measured in blubber of 18 cetaceans, including humpback, sperm, dense-beaked, Atlantic and Pacific pilot whales, and five species of dolphins. All had significant residue levels, ranging from 1.1 to 1023 ppm DDT (wet weight basis) and 0.7-147 ppm PCBs. These levels are high enough to justify efforts to reduce PCB contamination of the oceans and a continued ban on widespread use of DDT. (Katz)

FLUORINE IN DRINKING WATER OF EASTERN SLOVAKIA, (IN RUSSIAN),
Univerzita Pavala Jozefa Safarika, Kosice (Czechoslovakia). Faculty of Medicine.
T. Petrilyakova, M. Mikulova, and P. Postishil.
Gig Sanit 4, p 82-84, 1975.

Descriptors: *Potable water, *Fluorine, Sedimentary rocks, Mineral water, Pollutant identification, Sampling.
Identifiers: *Czechoslovakia, Slovakia, Flysch.

In 1970-1972 541 drinking water samples from 284 populated areas of Eastern Slovakia were investigated; 44% of the samples contained F in a concentration of 0.00-0.10 mg/l, 37% had 0.15-0.45 mgF/l, and 16% had optimal F concentrations, 0.50-1.2 mg/l. The comparatively low F content in drinking waters is due to the face that the territory of Eastern Slovakia is composed primarily of flysch-type sedimentary rocks. More mineralized waters contain F in greater concentrations.

Khimiya Drevesiny, No. 3, p 97-101, May/June, 1976. 3 fig, 8 ref, 2 tab.

Descriptors: *Pulp wastes, *Lignins, Degradation(Decomposition), Effluents, Pine trees, Separation techniques, Chromatography, Model studies, Waste water(Pollution), Water pollution sources, Wastes, Industrial wastes.
Identifiers: Dioxane lignin, Black liquors, Molecular weight, Kraft mills.

Dioxane lignin from pine wood was subjected to alkaline cooking under conditions simulating those used in the production of kraft pulp (24% NaOH, 20% sulfidity, 8:1 liquor ration at 170 C for 3 hr). The black liquor from the reaction was fractionated by extraction with various solvents at pH 11.5 to 1.5. A diagram of the fractionated procedure is given. All the fractions were analyzed by gel chromatography for the purpose of comparing the molecular weight distribution curves. The molecular weight distribution of the acid-insoluble fraction was similar to that of the starting dioxane lignin. The acid-soluble fractions were dispersed over a wide range of molecular weights. The amount of monomeric material was small. (See also W77-02586 and W77-02587) (Chern-IPC)
W77-02585

MODELING OF ORGANIC COMPONENTS IN ALKALINE EFFLUENTS FROM KRAFT PULP PRODUCTION. II. Descriptors: *Pulp wastes, *Lignins, *Physicochemical properties, Effluents, Pine trees, Model studies, Water pollution sources, Wastes, Industrial wastes, Organic acids, Organic compounds.
Identifiers: Dioxane lignin, Functional groups, Ultraviolet spectra, Infrared spectra, Kraft mills, Black liquors.

The functional groups of the fractions obtained from the alkaline pulping of pine dioxane lignin under conditions simulating production of kraft pulp were analyzed by IR and UV methods. With decreasing pH the carboxyl group content in the acid-soluble fractions increased while the phenolic OH content decreased. All of the fractions had methoxyl group contents of 11-17%, except the ether-soluble fraction at pH 1.5 which had methoxyl content of 8.94%. The data are in agreement with literature data on the composition of the organic portion of black liquor. IR spectra are included. (See also W77-02585 and W77-02587) (Chern-IPC)
W77-02586

MODELING OF ORGANIC COMPONENTS IN ALKALINE EFFLUENTS FROM KRAFT PULP PRODUCTION. III. STUDY OF CARBOHYDRATE DECOMPOSITION PRODUCTS (MODELIROVANIE ORGANICHESKIKH KOMPONENTOV SHCHELOKOSODERZHASHCHIKH STOCHNYKH VOD SUL'FATNO-TSELLYULOZNOGO PROIZVODSTVA. III. Khimiya Drevesiny, No. 3, p 105-109, May/June, 1976. 3 fig, 9 ref, 1 tab.

Descriptors: *Pulp wastes, *Carbohydrates, Effluents, Organic acids, Lignins, Organic compounds, Lead, Salts, Wastes, Industrial wastes, Water pollution sources, Pine trees, Model studies.
Identifiers: Holocellulose, Kraft mills, Fatty acids, Acetic acid, Black liquors.

Holocellulose obtained in 70% yield from pinewood by the peracetic acid method was subjected to alkaline pulping under conditions simulating production of kraft pulp. The starting holocellulose consisted of 90% reducing substances and 0.9% lignin. Carbohydrate loss during holocellulose isolation was 10%. Diagrams are given for the separation of the organic components from the alkaline pulping, separation of the acid and hydroxy acid fraction, and separation of acid and hydroxy acids from the lead salts. Analysis of the organic substances from the pulping of holocellulose indicated that the nonvolatile compounds consisted of hydroxy and polyhydroxy acids and their lactones. The volatile acid fraction consisted of fatty acids, mostly acetic. (See also W77-02585 and W77-02586) (Chern-IPC)
W77-02587

GROUNDWATER POLLUTION BY WOOD WASTE DISPOSAL,
Oregon State Dept. of Environmental Quality, Salem.
H. R. Sweet, and R. H. Fetrow.
Ground Water, Vol. 13, No. 2, p 227-231, March/April, 1976.

Descriptors: *Groundwater, *Lumbering, *Water pollution, *Wood wastes, *Oregon, Bark, Leachate, Lignins, Color, Odor, Iron, Manganese, Water pollution sources, Waste disposal, Wastes, Industrial wastes, Solid wastes, Water wells, Water pollution effects, Forest management.
Identifiers: Willamette Valley(Ore), Tannins, Forest products industry.

Timber production and wood products industries in the Mid-Willamette Valley of Oregon annually dispose of about 547,000 tons of wood and bark wastes. Land storage or disposal of these wastes can result in the generation of significant volumes of leachate. Wood waste leachates are commonly characterized by lignin-tannin (measured as tannic acid), oxygen-demanding materials, color, and odor. In this study, lignin-tannin concentrations in the groundwater ranged as high as 7.5 mg/liter; iron and manganese were also shown to increase markedly relative to natural background concentrations, ranging as high as 13 mg/liter and 106 mg/liter, respectively. In August 1972 the area affected by the contaminated groundwater covered about 4 acres (1.6 hr) and extended nearly 1,000 ft (330 m) downhill from the disposal site. By late January 1973 the plume had migrated laterally to affect an area of about 15 acres (6 ha) while extending over 1,500 ft (460 m) downhill. The lateral migration is attributed to a seasonal change in the local flow system. At least eleven existing domestic water-supply wells have been rendered nonpotable by this pollution. (Witt-IPC)

POLLUTION CONTROL IN INDIAN STEEL INDUSTRY,
Regional Engineering Coll., Rourkela (India) Dept. of Metallurgical Engineering.
R. C. Behera, and P. K. Senapaty.
Chemical Age of India, Vol 27, No 6, p 533-538, June, 1976. 6 tab, 23 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Steel, *Water pollution control, *Chemical wastes, Adsorption, Filtration, Aeration, Activated sludge, Flotation, Settling basins, Oxidation, Chemical precipitation, Neutralization, Reduction(Chemical), Suspended solids, Oil wastes, Phenols, Ammonia, Sodium, Iron, Aeration.
Identifiers: *Steel industry(India), *India, Thiocyanates, Thiosulfates, Tin, Chromates.

Sources of pollution in the Indian steel industry are reviewed along with methods for their control. Water pollution is caused by waste waters in the form of coke oven liquor, blast furnace cooling water, lubricating water from rolling mills, pickling liquor and wash water from electrolytic processes, and blast furnace gas scrubbing water. Methods currently being used to control these sources of water pollution include: adsorption on fly ash, filtration through plastic media, aeration, activated sludge treatment, flotation, settling, chemical neutralization, chemical oxidation and reduction, and lime precipitation. Pollutants controlled by these processes include: phenols, ammonia, thiocyanate, thiosulfate, oil emulsions, iron, chromates, tin, sodium, and suspended solids. (Kreager-FIRL)
W77-02605

CHEMICAL PULPING,
H. Norrestrom.
Pure and Applied Chemistry, Vol. 45, No. 3/4, p 181-186, 1976. 15 fig, 6 tab.

Descriptors: *Pulp and paper industry, *Waste water treatment, *Pulp wastes, *Biochemical oxygen demand, *Color, Effluents, Liquid wastes, Bleaching wastes, Chemical wastes, Neutralization, Suspended solids.

Various types of pulping processes are discussed in relation to the amount of wastes they generate. A typical 7-day biochemical oxygen demand figure for mechanical pulping is 25 kg/ton of pulp, with the bleaching operation contributing about 10 kg/ton. The amount of suspended solids in the effluent is normally between 20 and 30 kg/ton of pulp. Anywhere from 150-600 kg biochemical oxygen demand/ton of pulp is generated during chemical pulping. Normally, however, the spent liquor is collected, evaporated, and burned leading to at least a 95% reduction in biochemical oxygen demand discharge. The total biochemical oxygen demand of digester and evaporator condensates is about 10-12 kg/ton for kraft pulping and about 25 kg/ton for sulfite pulping. The total biochemical oxygen demand and color in effluent generated by the bleaching of softwood kraft pulp are about 15 and 170 kg/ton, respectively. The amount of color in effluents from kraft pulp bleaching and the biochemical oxygen demand value for the sulfite process is also slightly lower than that for kraft processes. Techniques for reducing pollution from pulping processes include oxygen bleaching and neutralization of sulfide condensates. (Kreager-FIRL)

Identifiers: Daily intake(Cadmium), *Cadmium analysis, Tissue analysis, Water analysis, Daily uptake, Cadmium excretion, Metallothionein, Pathological effects on humans, Itai-Itai.

A review is presented of the biomedical literature regarding cadmium. The major part of the material covered is published before 1973 to 1975. Subjects discussed are the problems of analysis in air, water and biological substances, possible routes of exposure, metabolism transport, distribution and excretion of cadmium. The effects of cadmium in biological systems is explored. (See also W74-12492 and W72-08062) (Katz)

ocides, Antifouling coatings, *Alkytin com-nds.

purposes of this study were to identify the duction methods, importation, exportation, use erns, and exposure to man and the environ-nt for selected alkyltin compounds from 1965 to 4. For this study, only organotin compounds ing alkyl groups with eight carbon atoms or attached to the tin were considered. Data for production methods included the specific cess, raw materials, annual production quanti-, major manufacturers, waste products, en-nmental management of process wastes, and er production data. Use patterns were tified and annual consumption data were com-d for each compound in the respective areas of zation. Major consumers in each use area were tified. Various possible methods for the expo-e of man and the environment to alkyltin com-nds were discussed and evaluated. Future duction quantities and areas of usage were esti-ed for the next 10 years. rapid development of the lead mining industry e 'New Lead Belt' of southeastern Missouri ed serious concern as to the effects of lead ng activities on the surrounding virgin forest ystem. The objectives of this research are to mine the extent and causes and effects of y metal contamination from lead mining and lting on the surrounding forest, and to develop rmation for state and federal agencies so that opriate corrective action could be taken. This ect is a good example of a well-utilized arch program having significant value to in-ry, government, and to the public. The project y team served as a catalyst, bringing together stry and regulatory agencies in a cooperative rt to understand and solve a potentially serious lem. (Katz)

ADSORPTION OF COPPER AND COBALT FROM FRESH AND MARINE SYSTEMS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
T. P. O'Connor, and D. R. Kester.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A021 602, Price codes: A02 in paper copy, A01 in microfiche. Geochimica et Cosmochimica Acta, Vol 39, p 1531-1543, 1975. 5 tab, 16 fig, 35 ref.

Descriptors: Water quality, *Metals, *Path of pollutants, *Copper, *Cobalt, Adsorption, Chemical properties, *Anion adsorption, Liquid wastes, Surfaces, Methodology, Acidity, Hydrogen ion concentration, *Illite, Ion exchange.
Identifiers: Solid phase concentration, Ionic strength, Ligands, Cobalt ions, Magnesium ions, Complexing ligands.

The adsorption of copper and cobalt from aqueous solution on to illite and other substrates has been studied as a function of pH, solution composition and solid phase concentration. The results are interpreted in terms of a model whereby the trace metals are adsorbed in exchange for surface bound H+ ions. Adsorption varies with solution ionic strength and the concentrations of complex forming ligands; both of these parameters tend to reduce the trace metal adsorption. The Cu2+ is two orders of magnitude more reactive toward solid surfaces than Co2+, which is consistent with the general reactivities of these two metal ions. It is also found that Mg2+ interferes with adsorption, presumably by competing with the trace metals for the surface sites. A quantitative model was developed which describes adsorption of these metals from natural waters ranging from river water to sea water as a function of pH, complexing ligands and magnesium activity. ERDA Idaho National Engineering Laboratory, Idaho Falls, Report ICP-1095, UC-11, June, 1976, 50 p, 6 tab, 10 fig, 77 ref.

Descriptors: *Metals, *Path of pollutants, Alkaline earth metals, Alkaline soils, *Lead, Soil contamination, Soil chemistry, Soil analysis, Soil science, *Path of pollutants, Physiology, Calciuum, *Calcium compounds, *Food chains, *Food habits, Spectroscopy, Trophic level.
Identifiers: *Trophic pathway, Stomach contents, Animal tissue.

Attempts were made to place the abundance of non-essential metals in a context of chemically similar metals of the same periodic table group. This information would be useful because the increased knowledge of metal pollution for herbivores would be provided. Data developed shows that non-essential and toxic metals are discriminated against relative to their chemically related nutritious metal, as the metals are transferred through the trophic pathway levels. SUMMARY OF GROUND-WATER QUALITY IMPACTS OF URANIUM MINING AND MILLING IN THE GRANTS MINERAL BELT, NEW MEXICO,
Office of Radiation Programs, Las Vegas, Nev.
R. F. Kaufmann, G. G. Eadie, and C. R. Russell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-247 282, Price codes: A05 in paper copy, A01 in microfiche. Technical Note, ORP/LV-75-4, August, 1975, 70 p, 9 tab, 11 fig, 34 ref.

Descriptors: *Groundwater, *Water pollution, *Hydrogeology, *Radioactivity, Waste disposal, *Uranium radioisotopes, *Waste water disposal, *Injection wells, Radioactive wastes, *Public health, Mining, *Mine wastes, *New Mexico.
Identifiers: *Uranium, Natural radioactivity, Radium, Uranium mining, Uranium milling, Tailings.

Ground-water contamination from uranium mining and milling results from the infiltration of radium-bearing mine, mill, and ion-exchange plant effluents. Radium, selenium, and nitrate were of most value as indicators of contamination. In recent years, mining has increased radium in mine effluents from several picocuries/liter (pCi/l) or less, to 100-150 pCi/l. the shallow aquifer in use in the vicinity of one mill was grossly contaminated with selenium, attributable to the mill tailings. Seepage from two other mill tailings ponds averaged 674 x 10 to the 6th power liters/year and, to date, has contributed an estimated 1.1 curies of radium to ground water. At one of these, an injection well was used to dispose of over 3400 x 10 to the 6th power liters of waste from 1960-1973. The wastes have not been properly monitored and have apparently migrated to more shallow potable aquifers. No adverse impacts on municipal water quality in Paguate, Bluewater, Grants, Milan, and Gallup were observed. No correlation was found between gross alpha greater than 15 pCi/l and radium-226 in excess of 5 pCi/l. (Katz)

Sea Grant Program Report No. MITSG-75-22, Index No. 75-322-Nwg, September 15, 1976. 203 p, 19 fig, 31 reg, 2 append. SG 04-5-158-1.

Descriptors: *Oil spills, *Oil pollution, *Ocean waves, *Interfaces, *Oil-water interfaces, Waves(Water).
Identifiers: Interfacial elasticity, *Mass transport, Monolayer problems, Asymptotic expansions, Sea Grant Program.

The combined effects of interfacial elasticity and multiple fluid layer geometrics upon the first order properties of surface waves are analyzed for application to the oil spill problem. The technique of matched asymptotic expansion is used in conjunction with a small amplitude assumption regarding the wave height. The theory of interfacial elasticity is briefly reviewed, and critical parameters are identified. Recommendations for further study of oil-water adsorption and mixed monolayer elasticities are developed. The second order mass transport properties are discussed in light of the first order solutions. It is concluded that the enormous potential of this system for significant variation in the first order properties makes further theoretical analysis highly dependent upon the availability of suitable experimental data to direct the theoretician. SEDIMENT DISPERSAL PATTERNS AS CLUES TO PLACER-LIKE PLATINUM ACCUMULATION IN AND NEAR CHAGVAN BAY, ALASKA,
Wisconsin Univ., Madison. Marine Research Lab.
R. M. Owen, and J. R. Moore.
Sea Grant College Reprint No. WIS-SG-76-360 reprinted from: Proceedings of Offshore Technology Conference, Paper No. OTC 2453. May 1976. 14 p, 5 fig, 23 ref.

Descriptors: *Bays, *Alaska, *Sediments, *Placer mining, *Sediment transport, Provenance, Mining, Geochemistry, Metals, Resources, Dispersion, *Path of pollutants.
Identifiers: *Platinum, *Dispersal patterns, *Chagvan Bay(AK), Bering Sea, Mineral deposits.

The modern sediments of Chagvan Bay, Alaska contain zones of platinum enrichment which suggest an external source of platinum-host sediments. Two mathematical sediment tracing techniques, based on vector and multiple regression analyses of geochemical data, are used to determine the provenance and dispersal patterns of the bay deposits. Criteria for the selection of natural sediment tracers are presented, and the application of tracing techniques to the exploration for high latitude marine placers is discussed. (NOAA)

EFFECTS OF BALED SOLID WASTE DISPOSAL IN THE MARINE ENVIRONMENT--A DESCRIPTIVE MODEL,
New Hampshire Univ., Durham. Dept. of Earth Sciences.
T. C. Loder.
Sea Grant Reprint No. UNH-SG-JR-100, 1975 Reprinted from ACS Symposium Series, No 18, Marine Chemistry in the Coastal Environment, 1975. 21 p, 5 fig, 6 tab, 40 ref. SG-2-35244. UNH No. 10230372.

Descriptors: *Waste disposal, *Water quality, *Environmental effects, Solid wastes, Municipal wastes, Mathematical models, *Path of pollutants.
Identifiers: *Marine environment, *Ocean dumping, Ocean environments, Baled wastes.

Compacted experimental bales of municipal solid waste (trash) have been immersed in seawater for several years and monitored for chemical, biological and physical changes. This experimental data is used to develop a descriptive and simple mathematical model for a commercial-sized disposal operation on the continental shelf or deep water off the shelf, handling the needs of a medium-sized coastal city. Factors considered in the model include: bale size; quantity per unit time; bale composition; packaging; areal extent of dump; depth; biota; current regime; decomposition rates; and the effects on water quality such as oxygen consumption, dissolved organics, nutrients, and hydrogen sulfide. The effects of a dumpsite on bottom water quality at the end of one year are calculated for a shallow and deep site for the 'average-most likely' dump and plausible extremes of the above variables. (NOAA)

PROBABILISTIC TRAJECTORY ASSESSMENTS FOR OFFSHORE OIL SPILLS IMPACTING LONG ISLAND,
Massachusetts Inst. of Tech., Cambridge.
P. J. Stewart, and J. W. Devannoy, III.
Report to Nassau-Suffolk Planning Board, Regional Marine Resources Council, November 15, 1974. 35 p, 9 fig.

Descriptors: *Oil spills, *Oil pollution, *Water pollution sources, *Winds, *Ocean currents, New England, *New York, Beaches, Coasts, Shores, Seasonal, Ocean circulation.
Identifiers: Outer Continental Shelf, *Long Island(NY), Nantucket Shoals, Wind fields, Trajectories

This study has shown that under the presumed current and wind fields, it is reasonable for Long Island to anticipate that some spills from the Nantucket Shoals region will beach upon her shores given a sufficient number of such events. In particular, it appears that the probability of a spill beaching on Long Island given that it originated on Nantucket Shoals is on the order of .05 in the summer and perhaps .01 or less in the winter. The times to shore for spills from this area appear to be in the thirty- to forty-day range on the average, and the minimum is around twenty days. These predictions are somewhat at variance with our previous results, but this can be explained by the differences in the wind field specifications. (NOAA)

COMPARISON OF 115M CD ACCUMULATION FROM SEDIMENTS AND SEA WATERS BY POLYCHAETE WORMS,
National Inst. of Radiological Sciences, Nakaminato (Japan). Marine Radio-Ecological Research Station.
T. Ueda, R. Nakamura, and Y. Suzuki.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 42(3), p 299-306, 1976. 2 tab., 5 fig, 20 ref.

Descriptors: *Metals, *Cadmium, *Marine pollution, *Path of pollutants, *Sediments, *Benthic organisms, Invertebrates, Annelids, Bottom sediments, Water quality, Sea water, Industrial wastes, Algae.
Identifiers: Concentration factors, 115m-Cd, Marine sediments, *Polychaete worms, Cadmium accumulation, Cadmium activity ratios.

To know the role played by marine sediments in influencing the fate of discharged metals, (1) the interaction of metals between sediments and deposit-feeder marine worms (Nereis japonica) and (2) uptake and excretion of metals by worms were examined by laboratory experiments using 115m-Cd. Worms directly in contact with 115m Cd-sediments accumulated 115m-Cd six times more rapidly than worms that were not in contact with the 115m-Cd sediments during the 8 days of experimentation. Comparing the concentration factor of 22 (from sea water) with accumulation from sediments, it was assumed that 115m-Cd in sediments would give the effect of 1/200 to the accumulation of 115m-Cd by worms in sea water to the accumulation of 115m-Cd. Further, to simulate these results close to that occurring in the natural ecosystem, the distribution of 115m-Cd in sea water, sediments and alga were also examined by means of a curve analysis of the distribution pattern by a three compartment model. It proved that the activity ratios of 115m-Cd were 9 for sediments and 21 for alga, which was similar to 22 for worms. (Katz)

STORM WATER MANAGEMENT MODEL STUDY, VOLUME I.
MacLaren (James F.) Ltd., Toronto (Ontario); and Proctor and Redfern, Toronto (Ontario).
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No 47, Environmental Protection Service, Environment Canada, Ottawa, Canada, September 1976, 295p., 100 fig., 32 tab, 123 ref. 73-5-10.

Descriptors: *Storm water, *Model studies, Canada, Watersheds(Basins), Water management(Applied), Data collections, Snowmelt, Runoff.
Identifiers: Storm Water Management Model(SWMM), Submodels.

Final results and conclusions of a study of storm water management models are described. Objectives were: to review and modify the U.S. Environmental Protection Agency's Storm Water Management Model (SWMM) for Canadian conditions; to select and modify a submodel for the simulation of quantity and quality of runoff resulting from snowmelt; to develop a data analysis submodel capable of extracting the SWMM meteorological data input from existing data banks; and, to select and modify a high-speed model for simulation of frequency of discharges and overflows, capable of using output from the data analysis submodel as input. This study has expanded the capabilities of the original SWMM. Methods of aggregating the properties of individual subcatchments into a single equivalent catchment are described which can lead to a considerable reduction in data preparation and computer processing time. A generalized quality model was developed, based on SWMM equations and using the simplications obtained in the aggregating techniques. Snowmelt quantity and quality models have been integrated with the SWMM. Methods of interfacing the SWMM and STORM (U.S. Army Corps of Engineers) models have been discussed and demonstrated, and a fully operational package of models, capable of simulation of all spects of storm water flow and quality, has been prepared for application to Canadian conditions. STORM WATER MANAGEMENT MODEL STUDY, VOLUME II.
MacLaren (James F.) Ltd., Toronto (Ontario); and Proctor and Redfern, Toronto (Ontario).
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No 48, Environmental Protection Service, Environment Canada, Ottawa, Canada, September 1976, 148p., 8 fig., 34 tab, 127 ref. 73-5-10.

Descriptors: *Storm water, *Model studies, Snowmelt, Runoff, Research and development, Publications, Urban runoff, Water quality, Water quantity, Data collections, Waste water treatment.
Identifiers: *Storm Water Management Model(SWMM).

Supplementary technical material used in preparing the final report is described. Comparative analyses of six storm water routing models and four water quality models are described. Literature surveys are included for material dealing with urban runoff quality and snowmelt quantity and quality. Sources of data required for storm water modelling have been assessed, and study areas in Canada and the U.S. are described. A summary of the treatment processes available in the U.S. Environmental Protection Agency's Storm Water Management Model (SWMM) is given, and current literature and modifications to the treatment model are described. ASBESTIFORM FIBRE LEVELS IN LAKES SUPERIOR AND HURON,
Canada Centre for Inland Waters, Burlington (Ontario).
R. W. Durham, and T. Pang.
Inland Waters Directorate, Scientific Series No 67, 1976. 12 p, 5 fig, 5 tab, 9 ref.

Descriptors: *Asbestos, *Lake Superior, *Lake Huron, Lakes, Aquatic environment, Rivers, Mining, Sampling, Water analysis, Potable water, Great Lakes, Minnesota, Water pollution sources, Pollutant identification.
Identifiers: *Asbestiform fibres(Mineral), Concentrations, Silver Bay(Minn), Georgian Bay.

Asbestiform fiber concentrations from less than 0.1 million to 87.3 million per litre were measured in the open waters of Lake Superior during 1973. The most commonly occurring mineral fiber was chrysotile, although fibers of the amphibole mineral commingtonite were found in the western arm of Lake Superior near the Reserve Mining tailings dumping site at Silver Bay, Minnesota. The results suggest that the zone of influence of this dumping of asbestiform fibers does not extend far out into the lake and that it decreases from June through November. Rivers flowing into Lake Superior which were analyzed all had low chrysotile fiber concentrations below 8 million per litre, as did samples taken in spring 1974 from Lake Huron and Georgian Bay. BEHAVIOUR OF OIL SPILLED IN ICE-COVERED RIVERS,
Department of the Environment, Ottawa (Ontario). Inland Waters Directorate.
E. C. Chen, B. E. Keevil, and R. O. Ramseier.
Scientific Series No. 61, 1976, 34p., 4 app., 14 fig., 3 tab, 27 ref.

Descriptors: *Oil spills, *Ice, Ice cover, Rivers, Behavior, Oil-water interfaces, Drops(Fluids), River flow, Pipelines, Crude oil, Cold Regions, Canada, Path of pollutants, Oil pollution, Water pollution sources.
Identifiers: Ice-water interfaces, Oil slick, Thermal effects, Northern Canada.

Experiments were carried out in a cold room at -15C to investigate the behavior of Norman Wells crude oil spilled under freshwater ice. The oil, when released in water under ice, separates into droplets and rises to the ice-water interface where the oil drops coalesce to form a slick. The spreading of oil under ice is complicated by the coalescence of oil drops at the interface. In calm waters, the radius of the oil slick under ice is approximately proportional to 0.25 power of the elapsed time. In turbulent waters, however, the oil drops travel some distance, following the flow direction of water, before reaching the interface. Some of the small drops are suspended and dispersed in the water column. The slick formed at the ice-water interface does not adhere to the ice and contains some water-in-oil emulsions. If the oil is spilled under the ice and the ice continues to grow, the oil will be sandwiched between the ice layers. An oil lens trapped between the ice layers acts as an insulator and increases the temperature drop across the ice. The behavior of accidental oil spills in Canadian rivers was surveyed and analyzed. Observations of these accidental spills show that the oil, when spilled in a river, is quickly dispersed downstream. (Environment Canada)

NTA (NITRILOTRIACETIC ACID) - AN ECOLOGICAL APPRAISAL,
Environmental Protection Service, Ottawa (Ontario).
A. Prakash.
Economic and Technical Review Report EPS 3-WP-76-8, November 1976. 45 p, 1 fig, 85 ref, 2 tab, append.

Descriptors: *Nitrilotriacetic acid, Aquatic environment, Biodegradation, Detergents, Sewage treatment, Risks, Temperature, Projections, Potable water, Algae, Fish, Environmental effects, Water pollution effects, Ecology.
Identifiers: Receiving waters, Removal, NTA-metal complexes.

Environmental aspects of NTA are emphasized; an assessment is included of the ecological distribution and effects of NTA in the aquatic ecosystem, based on data from field monitoring and laboratory and pilot scale studies in Canada and the United States. Factors affecting biodegradability of NTA in the recipient environment, and current and projected environmental levels of NTA are discussed. General effects of increased amounts of NTA on aquatic ecosystems

and specific effects on algae, invertebrates and fish are reviewed. Adequate safety margins exist between anticipated NTA levels in the environment and those which are likely to produce deleterious ecological effects; and continued vigilance is recommended in certain special situations where a potential for cumulative build-up of NTA may exist. (Environment Canada)

EFFECTS OF PULPWOOD HARVESTING ON THE QUALITY OF STREAM WATERS OF FOREST CATCHMENTS REPRESENTING A LARGE AREA IN WESTERN ALBERTA, CANADA,
Northern Forest Research Center, Edmonton (Alberta).
T. Singh, Y. P. Kalra, and G. R. Hillman.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No 113, p 21-27, 1974. 2 tab, 9 ref

Descriptors: *Forest watersheds, *Water quality, *Forest management, *Canada, Lumbering, Watersheds(Basins), Nutrients, Runoff, Lodgepole pine trees, On-site investigations, Data collections, Demonstration watersheds, Trees, Coniferous trees, Pulp and paper industry.
Identifiers: *Alberta(Canada).

The effects of pulpwood harvesting on water quality are being studied by the Canadian Forestry Service. The study reported was conducted from 11 May to 28 June 1973 on a pulp lease area (7770 sq km) in Western Alberta. Thirteen catchments in three working circles were selected, seven represented the undisturbed condition whereas the remaining six had been partially logged during the past ten years. Analysis of variance showed no significant difference in the concentration of cations between treated and untreated catchments. The long-term effects of pulpwood harvesting were not significantly different from the natural erosion of nutrients from undisturbed forests. (See also W77-02771) (Humphreys-ISWS)
W77-02774

THE EFFECT OF AGRICULTURE ON THE SURROUNDINGS OF LAKE BALATON,
University of Agriculture, Keszthely (Hungary).
A. Toth, and Z. Fekete.
In: Effects of Man on the Interface of the Hydrological Cycle with the Physical Environment; Proceedings of Paris Symposium, September 1974. International Association of Hydrological Sciences Publication No. 113, 36-39, 1974. 1 fig, 4 tab, 3 ref.

Descriptors: *Water pollution sources, *Lakes, *Agriculture, Water quality, Shallow water, Soil erosion, Farm management, Farms, Cultivation, Cultivated lands.
Identifiers: *Hungary, *Lake Balaton(Hungary).

The influence of agriculture on man's environment in the basin of Lake Balaton was studied. It was ascertained that the pollution of the lake stems primarily from soil erosion, and that deep ploughing and contour cultivation diminish erosion and pollution to a large extent. Plant nutrient losses were calculated from measurements taken over a 10-year period. The polluting effects of fertilizing and plant protection were also examined. It was noted that animal husbandry pollutes the waters; water plants in the lake quickly multiply due to the influence of sewage; soil pollution in the health resorts is rendered harmless by a high humus content. Descriptors: *Water pollution sources, *Pollutants, *Wastes, *New York, *Waste disposal, Water pollution, Water quality, Waste water(Pollution), Organic matter, Fallout, Drainage effects, Surface water, Drainage, Coasts, Runoff, Gaging stations, Urban runoff, Surface runoff, Ecosystems, Gages, Heavy metals, Municipal wastes
Identifiers: *Coastal zones, *New York Bight, Barge dumps, Microbes, Coastal waters, Dredge spoils.

This paper presented an estimate of the location and magnitude of contaminant inputs into the New York Bight, indicated their relative importance, and identified data gaps. Four sources of contaminant inputs were evaluated in the study: barge dumps, atmospheric fallout as direct Bight inputs, wastewater, and runoff as coastal inputs to waters ultimately draining to the Bight. For each source, in addition to flow or volume, recent data on 23 separate contaminants obtained from numerous agencies were used to estimate the inputs of solids, organic matter, nutrients, heavy metals, and microbes. A summary of the contribution by source and location was presented as well as an estimate of the annual or seasonal variability for selected sources. To evaluate the significance of the mass loads generated in the study, they were compared with an estimate of the background mass loads entering the Bight as a result of a net current across the ocean boundaries. Report No. EPA-670/2-75-061, June 1975. 249 p, 120 fig, 37 tab, 34 ref, 2 append. 1BB038 R 801799

Descriptors: *Water pollution sources, Boating, Lakes, *Analytical techniques, Gasoline, Toxicity, Oil wastes, Fishkill, Laboratory tests, Organic compounds, Pollutant identification.
Identifiers: *Outboard engines, Two cycle engines, Crankcase oil, Emissions, Exhaust

The outboard engine was assessed as a source of environmental pollution with particular emphasis on the aquatic ecosystem in small lake systems. A wide variety of two-stroke engines were run under load conditions and both condensable and non-condensable emissions analyzed in this laboratory-based study. The effect of a 'tune up' on emissions was also examined and found to have little impact. Crankcase drainage constituted a small fraction of the total hydrocarbons emitted, and consisted of 10-15 times more oil than the fuel mixture. Exhaust products expected to be condensable in water-column constituted less than 10% of the fuel in all cases, and were usually considerably less. The major portion of the water condensable aromatics had an evaporation half-life of approximately 11 days, though there was a small portion of non-volatile hydrocarbon fraction which was not removed by evaporation. Analytical methods for field study were developed, and the toxicity of both condensed exhaust and individual gasoline compounds to goldfish were determined. This research is one part of a three part study, the other two parts of which involved field studies. (Luedtke-Wisconsin)

A COMPARATIVE WATER QUALITY ANALYSIS OF SELECTED RECREATION LAKES AND STREAMS IN THE WHITE MOUNTAINS OF ARIZONA,
Arizona Univ., Tucson. School of Renewable Natural Resources.
J. G. Utter.
Master of Science Thesis, 1975. 151 p, 32 fig, 26 tab, 67 ref.

Descriptors: *Recreation wastes, *Water pollution sources, *Waste disposal, *Camping, Recreation facilities, Water quality, *Arizona, Streams, Lakes, Bacteria, Environment, Water pollution, Streptococcus.
Identifiers: *White Mountains area(Ariz).

This study examines the water quality issue in relation to selected recreation lakes and streams in the White Mountains of Arizona. Four major parameters of water quality were investigated: physical environment factors, chemical nutrient concentrations, fecal bacterial contamination, and visitor use effects. Results indicate intensive recreational use and development may be accompanied by decreased water quality. The research lake exhibiting the most intensive use and development showed significantly greater fecal bacterial contamination in the concentrated use area. Management considerations developed in this report are directed toward assisting recreation land managers in recognizing and preventing present and future water quality problems. (Jamail-Arizona)

THE POTENTIAL TRACE METAL CONTAMINATION OF WATER RESOURCES THROUGH THE DISPOSAL OF FLY ASH,
Notre Dame Univ., Ind. Dept. of Civil Engineering.
T. L. Theis.
In: 2nd National Conference on Complete Water Reuse held in Chicago, Illinois, May 4-8, 1975, 19 p, 5 fig, 3 tab, 27 ref.

Descriptors: *Environmental effects, Water resources, *Fly ash, Heavy metals, Water pollution, Water pollution sources, *Metals, Aquatic life, Trace elements.

In an effort to obtain data on trace metals, several fly ashes were gathered from power generating stations and subjected to a micro-elemental analysis. Considerable variability was found but the arsenic and cadmium contents of virtually al the fly ashes were consistently 5-100 times natural abundances while in at least one case all the other metals showed this same degree of excess. The report is concerned with the contact between fly ash and water supplies. Data on te pH, dissolved oxygen, and heavy metal leachate effects on aquatic resources are presented. (Chilton-ORNL)

THE LOCATION OF INDUSTRIAL WATER USERS AND AIR POLLUTION: AN OVERLOOKED RELATIONSHIP,
Argonne National Lab., Ill. Energy and Environmental Systems Div.
D. J. Santini.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 670, Price codes: A10 in paper copy, A01 in microfiche. Report NSF-RA-E-75-044 272, June 1975. 11 p, 5 tab, 1 fig. NSF and RANN Nos. AG-352 and GI 32989A2.

Descriptors: *Environmental effects, *Water utilization, *Air pollution, *Industrial water, Industrial plants, Sites, Economic feasibility, Water pollution sources.

The use of water in the production process is responsible for a great deal of concentration of industrial air pollution. For a policy of dispersal of water using air polluting industry to be achievable, the results of the study imply that either adequate water supplies must be provided at alternative locations or water use must be eliminated from the production pocess by technological means such as air cooling and that these means must be economically feasible. The report also indicates that even if these conditions are met that industries are still likely to choose urban locations. (Chilton-ORNL)

YEASTS AND FUNGI IN MARINE ENVIRONMENTS, (IN FRENCH),
Centre Hospitalo-Universitaire-Poitiers (France). Lab. of Bacteriology.
J. Briscou.
Bull Soc Fr Mycol Med 4(2), p 159-162, 1975.

Descriptors: *Yeasts, *Marine fungi, Sediments, Mollusks, Fish, Plankton, Coasts, Water pollution sources, Human infection.
Identifiers: *Candida, *Debaryomyces, *Saccharomyces.

The distribution and composition of fungal populations in coastal marine waters are reviewed. They are found in sediments, molluscs, fish intestines and plankton. Plankton serve as a vector for fungi. Common fungi are Candida, Saccharomyces and Debaryomyces. A major health problem is the large number of human intestinal fungi found in polluted coastal waters. Vaginal infections from Candida in women bathing in such waters are increasingly common. Better pollution control and caution by bathers are suggested.--Copyright 1976, Biological Abstracts, Inc.

THE GENERAL CHARACTER OF THE WATER OF THE MIDDLE OF THE SAALE RIVER, (IN GERMAN),
D. Floessner.
Limnologica 10(1), p 45-55, 1976.

Descriptors: Rivers, *Water pollution, Sediments, Oxygen, Organic matter, Seasonal, Biochemical oxygen demand, *Oxygen requirements.
Identifiers: Autotrophic population, *Saale River(East Germany), *Saprobity index.

The saprobity index at 6 locations along the river, from Eichicht to Grossheringen (East Germany), was calculated from Feb.-Oct. 1971 at 2 and 4 wk intervals, based on the number and frequency of saprobic organisms, sediment consumption, O2 balance and relative pollution level. This 5 km section of the river is borderline oligo--to beta--mesosaprobic. Biological activity is characterized by a high percentage of autotrophic organisms. An increase in suspended organic matter drastically reduced the autotrophic population during the winter. The calculated BSB5 (biochemical O2 requirement for 5 days per liter of water) was 600 kg O2 for the section between Rothenstein and Maua and 750 kg O2 for the Stoeben-Grossheringen section.--Copyright 1976, Biological Abstracts, Inc.

EFFECTS OF FLOOD FLOWS ON WATER QUALITY OF TIOGA-HAMMOND LAKES; HYDRAULIC MODEL INVESTIGATION,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
M. S. Dortch.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A029 143, Price codes: A03 in paper copy, A01 in microfiche. Technical Report H-76-11, August 1976. 42 p, 5 fig, 15 pl.

Descriptors: *Acidic water, *Alkaline water, *Floods, *Hydraulic models, *Unsteady flow, Water analysis, *Flow, Water quality, *Pennsylvania, Model studies.
Identifiers: *Hammond Lake(Penn), *Tioga Lake(Penn).

The physical model investigation was conducted to estimate the dilution and dispersion of acidic and alkaline substances within Tioga-Hammond Lakes as a result of flood flows and to determine the concentration of these substances in the outflow during drawdown. The model, consisted of Tioga and Hammond Lakes, the connecting channel of the dual reservoir system, Hammond outlet works, and the flood control intakes of Tioga outlet works. The model simulated density variations and stratifications expected to exist in the prototype due to temperature differences and reproduced the unsteady inflow and outflow hydrographs for various size floods. Concentrations of fluorescent dyes simulated the acidic and alkaline substances; water samples were collected and analyzed to determine the dilution and dispersion of the dyes throughout the lakes and in the outflow from the lakes. The expected concentrations of acidic and alkaline substances existing in the two lakes after flood inflows and drawdown and in the outflow during drawdown are presented for three flood conditions. The results provide information for estimating water quality for similar flood conditions within and downstream of the project and guidance for limiting adverse quality during drawdown. (WES)

B. Loftis, and D. C. Fontane.
Available from the National Technical Information Service, Springfield, Va 22161. Price codes A05 in paper copy, A01 in microfiche. Miscellaneous Paper H-76-6, April 1976. 76 p, 2 tab, 13 pl, 10 ref, append

Descriptors: *Dissolved oxygen, *Intake structures, *Water quality, *Water temperature, *North Carolina, Lakes
Identifiers: Falls Lake(NC)

A mathematical model was used to simulate the thermal and dissolved oxygen (D.O.) content of the proposed Falls Lake project and to evaluate the adequacy of the proposed multilevel intake structure for satisfying downstream temperature and D.O. objectives. The study indicated that proper operation of the proposed impoundment would result in satisfying the temperature objective. Low D.O. content values are predicted, reflecting the quality of water available for release through the intake structure and outlet works. However, reaeration of flow released through the multilevel outlet works should be sufficient to increase the D.O. content of the downstream release up to or above the desired minimum level of 5 mg/l. FEASIBILITY OF MONITORING FLOW PATTERNS AND SEDIMENT AND POLLUTANT DISPERSION OF WATER BODIES WITH 24-CHANNEL SPECTRAL DATA,
Army Engineer Waterways Experiment Station, Vicksburg, Miss
M. H. Smith
Available from the National Technical Information Service, Springfield, Va. 22161 as AD/A-025 333, Price codes A04 in paper copy, A01 in microfiche. Miscellaneous Paper M-76-10, May 1976. 55 p, 24 fig, 3 tab, 2 pl, 6 ref.

Descriptors: *Chesapeake Bay, *Data processing, Pollutants, *Remote sensing, Sediments, *Sediment transport, *Monitoring, Feasibility studies, *Path of pollutants, Data collections, *Dispersion.

The primary objective of this research effort was to develop data-handling procedures to transform digital data collected by a Bendix 24-channel airborne sensor into radiance values and to produce images free of skew and reflectance geometry distortion. Data collected over the Chesapeake Bay area on 26 October 1972 and 22 April 1973 at approximately 3200 m and later recorded on computer-compatible tapes (CCT) were studied. Special attention was focused on data from the Rappahannock River. The scanner system, including the mechanics, optics, and electronics, is described with an explanation of data formatting on the NASA-generated CCT and the formatting required by existing U.S. Army Engineer Waterways Experiment Station (WES) computer software and programs to handle remotely sensed data, specifically ERTS or LANDSAT CCT data. (WES)

B. EVERETT JORDAN LAKE WATER-QUALITY STUDY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
B. Loftis, P. E. Saunders, and J. L. Grace, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A021 682, Price codes: A09 in paper copy, A01 in microfiche. Technical Report H-76-3, February 1976. 193 p, 7 fig, 1 tab, 22 plates, 3 append, 19 ref.

Descriptors: *Hydraulic models, *Mathematical models, *Stratified flow, *Water quality, *Dissolved oxygen, Lakes, *North Carolina
Identifiers: *B. Everett Jordan Lake(NC), New Hope River(NC), Haw River(NC).

Physical and mathematical models were used to investigate the hydrodynamics of stratified flow within B. Everett Jordan Lake, to predict the temperature and dissolved oxygen (D.O.) regimes of the lake immediately upstream of the dam, and to estimate the temperature and D.O. content of the release. The hydrodynamic phenomena in the lake were significantly influenced by lake geometry, two highway crossings in the New Hope arm of the lake, and the relatively large quantity of flow contributed by the Haw River. The two highway crossings essentially divide the New Hope arm of the lake into three pools. The lower pool is influenced primarily by the Haw River, and the upper pool is influenced only by the New Hope River. The results of the numerical simulations indicate that the multilevel outlet works can be operated such that downstream temperature and D.O. objectives can be satisfied. (WES)

AN OILSPILL RISK ANALYSIS FOR THE NORTH ATLANTIC OUTER CONTINENTAL SHELF LEASE AREA,
Geological Survey, Reston, Va. Water Resources Div., and Department of the Interior, Washington, D. C. Office of Policy Analysis
R. A. Smith, J. R. Slack, and R. K. Davis
Open-file report 76-620, 1976. 50 p, 10 fig, 5 tab, 12 ref, append.

Descriptors: *Oil industry, *Atlantic Ocean, *Drilling, *Oil spills, *Environmental effects, Forecasting, Evaluation, Ecology, Path of pollutants, Continental shelf, Northeast U. S.
Identifiers: *Outer Continental Shelf

The Federal Government has proposed to lease 1,172,795 acres of Outer Continental Shelf (OCS)

ands on Georges Bank off the New England Coast or oil and gas development. Estimated recovera-le petroleum resources for the proposed 206 tract ale area range from 180 to 650 million barrels. Contingent upon actual discovery of this quantity f oil, production is expected to span a period of bout 20 years. An oilspill risk analysis was con-ucted to determine relative environmental azards of developing oil in the North Atlantic Outer Continental Shelf lease area. The study nalyzed probability of spill occurrence, likely ath of pollutants from spills, and locations in pace and time of recreational and biological esources likely to be vulnerable. These results are ombined to yield estimates of the overall oilspill isk associated with development of the lease area. (Woodard-USGS)
W77-02972

A RECONNAISSANCE OF THE EFFECTS OF A FOREST FIRE ON WATER QUALITY IN KINGS CANYON NATIONAL PARK, CALIFORNIA,
Geological Survey, Menlo Park, Calif. Water Resources Div.
R. J. Hoffman, and R. F. Ferreira.
Open-file report 76-497, August 1976. 17 p, 7 fig, 1 tab, 16 ref.

Descriptors: *Environmental effects, *Forest fires, *Water quality, *Surface waters, Data collections, Sampling, Water analysis, Chemical analysis, Water pollution, Dissolved solids, Nutrients, Trace elements, Carbon, Sediment transport, Algae, National parks, *California.
Identifiers: *Kings Canyon National Park(Calif), Benthic invertebrates.

Following two forest fires in the Roaring River drainage basin, Kings Canyon National Park, Calif., water samples were collected from May to July 1974 to determine water-quality changes resulting from the fires. Field measurements included alkalinity, pH, specific conductance, temperature, and discharge. Samples were analyzed in the laboratory for major dissolved chemical constituents, selected plant nutrients, trace metals, suspended sediment, total organic carbon, and seston. Periphytic algae and benthic invertebrate samples were collected. A noticeable increase in the concentration of nitrogen was found in Roaring River immediately downstream from the Moraine Creek fire. The increase in the concentration of inorganic nitrogen compounds, however, was not great enough to pose a serious threat to the aquatic ecosystem. High total organic nitrogen concentrations may have been due, in part, to factors other than the effect of fire. The results of other water-quality measurements were typical of dilute Sierra Nevada streams and indicate that Roaring River was not adversely affected by the fires. (Woodard-USGS)
W77-02973

PRELIMINARY RESULTS OF PREIMPOUNDMENT WATER-QUALITY STUDIES IN THE TIOGA RIVER BASIN, PENNSYLVANIA AND NEW YORK,
Geological Survey, Harrisburg, Pa. Water Resources Div.
J. R. Ward.
Available from the National Technical Information Service, Springfield, VA as ADA-029 315, Price codes: A05 in paper copy, A01 in microfiche. Water-Resources Investigations 76-66, July 1976. 39 p, 23 fig, 6 tab, 13 ref.

Descriptors: *Path of pollutants, *Acid mine water, *Water quality, *Pre-impoundment, Reservoirs, Pennsylvania, New York, Streams, Data collections, Mine drainage, Strip mines, Chemical analysis.
Identifiers: *Tioga River basin(Pa-NY).

Three impoundments have been proposed for the Tioga study area in Pennsylvania and New York. Two of the reservoirs, Tioga and Hammond Lakes, are presently under construction and will be completed in 1977. Cowanesque Lake is in the planning stages and will be started in the near future. The Tioga River and its major tributaries were sampled monthly from September 1973 to May 1975. Water quality in the Tioga River is degraded by acid-mine drainage entering the stream near Blossburg from both strip- and deep-mined areas. The stream supports few species of aquatic life from Blossburg to its confluence with Crooked Creek. Alkaline water of tributaries Mill Creek, Crooked Creek, and the Cowanesque River counteract the acidity carried downstream from Blossburg, and the water quality of the Tioga River gradually improves, supporting a more diversified population of fish and aquatic life. All of the streams in the Tioga River basin carry nutrients sufficient for algae blooms. Dissolved solids range from very high to moderately high throughout the basin. The Tioga River has high concentrations of sulfate and heavy metals, particularly iron and manganese. Dissolved oxygen was usually above 80 percent saturation and never dropped below 7.0 milligrams per liter throughout the basin. Relationships between selected water-quality parameters have been developed for the sampling stations throughout the basin. Downstream trends were also examined. (Woodard-USGS)
W77-02977

A WATER-QUALITY ASSESSMENT OF THE BURNHAM CREEK WATERSHED, POLK COUNTY, MINNESOTA,
Geological Survey, St. Paul, Minn. Water Resources Div.
M. R. Have.
Open-file report 75-647, 1975. 15 p, 2 fig, 4 tab, 12 ref.

Descriptors: *Water quality, *Surface waters, *Chemical analysis, *Water pollution sources, Evaluation, Water properties, Water analysis, Nitrates, Nitrites, Phosphates, Bacteria, Coliforms, Pesticides, Benthic fauna, *Minnesota, Path of pollutants.
Identifiers: Polk County(Minn), *Burnham Creek watershed(Minn).

A water-quality assessment of the Burnham Creek watershed, Polk County, Minn., was made in May 1975. Surface waters were calcium magnesium bicarbonate types with 0.11 mg/liter or less of nitrite plus nitrate nitrogen and 0.10 mg/liter or less of total phosphorous. Fecal coliform bacteria concentrations were between 3 and 720 colonies per 100 milliliters and fecal Streptococci concentrations ranged between 19 and 1600 colonies per 100 milliliters. Pesticide concentrations were low in the stream bottom materials, but an increasing trend was apparent in the downstream direction. The benthic community was dominated by blackfly larvae. (Woodard-USGS)
W77-02979

CONVECTIVE MODEL OF LONGITUDINAL DISPERSION,
Geological Survey, Jackson, Miss. Water Resources Div.
R. S. McQuivey, and T. N. Keefer.
Proceedings of ASCE, Journal of the Hydraulics Division, Vol 102, No HY10, Paper 12478, p 1409-1424, October 1976. 1 fig, 1 tab, 17 ref, append.

Descriptors: *Dispersion, *Path of pollutants, *Turbulence, *Streamflow, *Model studies, Analytical techniques, Evaluation.
Identifiers: Linear systems.

Longitudinal dispersion is the spreading out of substances along a stream or channel due to velocity differences and turbulent diffusion. Rather than moving downstream as a slug, the transported quantity is distributed along the length of the stream, some parts traveling faster and some slower than the mean-flow velocity. A model which describes the dispersion process accurately is essential to the understanding and managing of water pollution problems. Longitudinal dispersion can be successfully modeled as a purely convective linear process for approximately one-sixth of the time required to reach the diffusive period. A system-response function developed from the log-law velocity profile may be used up to this limit. The remaining five-sixths of the convective period is modeled as a chain of linear convective systems. Data sets from four flume tests and three natural rivers are used to verify the use of the convective response function. Excellent results are obtained in all cases. (Woodard-USGS)
W77-02988

DISPERSION--MISSISSIPPI RIVER BELOW BATON ROUGE, LA.,
Geological Survey, Jackson, Miss. Water Resources Div.
R. S. McQuivey, and T. N. Keefer.
Proceedings of ASCE, Journal of the Hydraulics Division, Vol 102, No HY10, Paper 12490, p 1425-1437, October 1976. 11 fig, 1 tab, 8 ref, append.

Descriptors: *Dispersion, *Path of pollutants, *Mississippi River, *Louisiana, *Model studies, Statistical methods, Numerical analysis, Turbulence, Water pollution, Mixing.

Dispersion is the spreading out of particles along a stream or channel due to velocity differences and turbulent diffusion. A knowledge of the dispersion characteristics of streams and rivers is essential to the understanding and managing of water pollution problems. The data described and analyzed consist of concentration-versus-time and concentration-versus-distance relations measured downstream of an instantaneous point source injection in the Mississippi River at Baton Rouge, La. The objectives of the study are to: (1) Document the initial mixing characteristics of the tracer photographically; (2) determine the longitudinal dispersion coefficient; and (3) verify a simple convective model of the dispersion process. Measurements of longitudinal dispersion and lateral and vertical mixing were made in the Mississippi River at a flow of 795,000 cfs. The results show that the longitudinal dispersion coefficient for the 179-mile reach from Baton Rouge to Point a la Hache, La., was approx 7,500 sq ft/sec. Vertical mixing was accomplished in about 50 miles. A numerical model based on a particular solution of the convection equation was used to aid in data collection. The model provides an accurate simulation of the dispersion process over the entire length of the study reach. (Woodard-USGS)
W77-02989

SAMPLING AND ANALYSIS OF STORM-WATER RUNOFF FROM URBAN AND SEMI-URBAN/RURAL WATERSHEDS - SYSTEMATIC DEVELOPMENT OF METHODOLOGIES IN PLANNING URBAN WATER RESOURCES FOR MEDIUM SIZE COMMUNITIES,
Purdue Univ., Lafayette, Ind. Dept. of Environmental Engineering.
F. T. R. McElroy, III, C. F. Mattox, D. W. Hartman, and J. M. Bell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-262 080, Price codes: A06 in paper copy, A01 in microfiche. Purdue University Water Resources Research Center, Technical Report No 64, September 1976. 102 p, 12 fig, 43 tab, 41 ref. (Partial Completion Report). OWRT C-3277(3713)(14).

Descriptors: *Storm runoff, *Urban runoff, *Suspended solids, *Biochemical oxygen demand, Storm water, Coliforms, Antecedent, Precipitation, Sampling, Automation, Methodology, Planning, Cities, Urbanization, Watersheds(Basins), Indiana, Water pollution sources, Waste identification, Rainfall.
Identifiers: *Pollutographs, *Sampling methodologies, Antecedent dry period.

Stormwater runoff samples were collected and analyzed from urban and semi-urban/rural watersheds located in West Lafayette, Ind. Preliminary sampling was performed in order to develop sampling methodology; i.e. to determine the importance of sampling frequency, duration etc., on the resultant stormwater pollutographs. The effects of total rainfall, rainfall intensity, and antecedent dry period on the run-off quality were also determined. The data clearly showed a significant difference in the pollutional concentration of BOD and suspended solids between the urban and semi-urban/rural watersheds. The peak concentration was almost always higher in the urban watershed, being 1-2 times higher in suspended solids and 8-9 times higher in BOD. The mass emission pollutographs were affected by both concentration and flow. However, the flow hydrograph had a much more significant effect on the shape and magnitude of the pollutograph than did concentration. There were indications that the antecedent dry period prior to the storm event had an effect on the magnitude of the mass emission pollutograph. This will receive more study in future research. EXTENSIVE OVERBURDEN POTENTIALS FOR SOIL AND WATER QUALITY,
West Virginia Univ., Morgantown. Div. of Plant Sciences.
R. M. Smith, A. A. Sobek, T. Arkle, Jr., J. C. Sencindiver, and J. R. Freeman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 739, Price codes: A15 in paper copy, A01 in microfiche. Environmental Protection Agency, Environmental Protection Technology Series, Report EPA 600/2-76-184, August, 1976. 310 p, 9 fig, 166 tab, 36 ref.

Descriptors: Pennsylvania, Alabama, Oklahoma, *Mining, *Soil classification, *Strip mines, *Strip mine wastes, Weathering, *Coal mines, *Mine acids, Water quality, *Appalachian Mountain Region, *Toxicity, *Nutrients, Acidic soils, *Water pollution sources, On-site-investigations.
Identifiers: *Potential toxicity, Available nutrients, *Mine soils, Acid base account.

Chemical, physical and mineralogic measurements and interpretations developed during previous studies in West Virginia have been improved and applied to coal overburden columns in 12 widely spaced Neighborhoods and 2 Adjunct locations in 10 states, from Pennsylvania on the Northeast to Alabama on the Southeast and Oklahoma on the West. Field studies in each Neighborhood and Adjunct location involved logging and sampling soil and rock horizons from surface to coal, testing and improving field clues, determining properties of minesoils and water resulting from mining operations, and checking reclamation. Results in different coal basins have broadened our perspectives and strengthened our conclusions. Refinements have been made in field observations, laboratory methods and interpretations related to kinds of mine soils and anticipated uses of mined lands. Consistent overburden property relationships within basis and over particular named coals provide opportunities for generalizations and extrapolation between sampled sites. It appears feasible to use detailed information from overburden sampling and analysis as an aid to pre-mining planning of surface mining operations including reclamation and projected land use. CADMIUM IN AN AQUATIC ECOSYSTEM: DISTRIBUTION AND EFFECTS,
New York Univ. Medical Center, N. Y. Inst. of Environmental Medicine
T. J. Kneip, and H. I. Hirshfield.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-242 180, Price codes: A06 in paper copy, A01 in microfiche. Report NSF-RA-E-74-044, 1975. 114 p, 4 tab, 4 fig, 10 ref.

Descriptors: *Cadmium, *Nickel, *Water pollution sources, *Water pollution effects, *Industrial wastes, *Hudson River, *Aquatic animals, *Mussels, Water quality, Plankton, Methodology, Toxicity, Fish eggs, Benthos, Methodology, *Ecosystems.
Identifiers: *Macrobenthic population studies, Fish toxicology, Macrobenthic toxicology.

This report is concerned with evaluating the distribution and effects of cadmium and nickel released into an aquatic ecosystem by local industry. The study focused upon the Foundry Cove Area which includes both a tidal marsh and an associated cove on the east side of the Hudson River just north of Constitution Island. The study provides data regarding (1) the processes resulting in the spread of contamination and (2) preliminary systematic information on uptake by biota and possible effects on certain organisms in the ecosystem. THE MICROBIAL DEGRADATION OF OIL IN CONTINUOUS CULTURE,
State Univ. of New York at Brockport. Dept. of Biology.
P. H. Pritchard, and T. J. Starr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD/A-013 322, Price codes: A05 in paper copy, A01 in microfiche. Annual Report No. 2, June 1975. 81 p, 8 tab, 14 fig, 59 ref. Task No. 133-070. ONR 0014-73-C-0074.

Descriptors: *Oil pollution, *Laboratory te *Methodology, *Oily water, *Oil spills, *Oil-wa interface, Laboratory analysis, Aqu microbiology, *Microbial degradation, *Biologi treatment, Aquatic environment, Gas chromat raphy.
Identifiers: *Microbial oil degradation, *Diesel *Continuous culture, Bacterial seeding, *Fate oil.

This project has dealt with the development testing of an experimental laboratory model the microbial degradation of oil in aqu ecosystems. The type of oil used in these stu was a light diesel oil. The model, which is a c tinuous culture system, allowed us to observe fate of a mini oil spill under quiescent condition a laboratory situation. The existence of a comp and very sensitive degradation process whic carried out by a diverse population of bacteria demonstrated. The bacterial attack follows a c sistent pattern of slow emulsification, dispersi and chemical alteration of the oil. It has b verified that the disappearance of oil from the face of a body of water does not, by any mea coincide with its complete degradation. The c plexity of the process, established herein, ex plifies the impractability of using 'seed procedures with commercial 'oil-eating' bacte preparations to deal with oil spills. The degradation process in our system was readily tered by the presence of simple organic pollut and not necessarily enhanced by the addition detergents. (Katz)

ANALYSIS OF NONPOINT-SOURCE POL TANTS IN THE MISSOURI BASIN REGION,
Midwest Research Inst., Kansas City, Mo.
A. D. McElroy, F. Y. Chiu, and A. Aleti
Available from the National Technical Infor tion Service, Springfield, VA 22161 as PB 245 Price codes: A09 in paper copy, A01 in microfi Environmental Protection Age Socioeconomic Environmental Studies Series, port EPA 600/5-15-004, March 1975. 163 p, 9 34 fig. Program Element 1BA030. 68-01-1863

Descriptors: *Water pollution sources, *Miss River, *Methodology, *Data collections, D processing, *Data storage and retrieval, *W quality, Climactic data, *Land use, Soil classif tion, *Statistical methods, Biochemical oxygen mand, *Nitrates, Turbidity.
Identifiers: Regression equation, *Water qua profiles, *Statistical analysis of significa *Missouri River Basin, *Nonpoint source po tants.

A study was conducted of nonurban, nonp sources of pollution in the Missouri Basin utili a unique, computer-based data system. The D Bank contains extensive information on land soil, climate, water quality, and other parame in the Missouri Basin. The current study was c cerned with the adequacy of the Data Bank r tive to development of nonpoint pollution mod Evaluation of information in the Data B yielded detailed land use and water quality prof in the basin. The results show that the Data B is a useful base to depict the basinwide relati between various land uses and water qua Regression equations of these relationships w developed for individual subbasins as well as the entire basin. The regression equations, and accompanying statistical analysis of significa indicated that the water quality parameters nitr BOD, and turbidity correlate well with land use a basinwide basis. Other parameters, nam phosphorous, dissolved oxygen, and dissol solids, did not correlate well with land use. (Kat W77-03013

ANTITATIVE RELATIONS BETWEEN THE YOPHYTES OF THE BELGIAN PART OF E RIVER SAMBRE AND THEIR FREQUEN- OF EMERSION: VERTICAL DISTRIBU- ON AND INFLUENCE OF POLLUTION, (IN ENCH),
ge Univ. (Belgium). Dept. of Botany.
in Empain.
l Soc R Bot Belg 107(2); p 361-374, 1974.

scriptors: *Mosses, *Submergence, *Rivers, ater pollution effects, *Environmental effects, logical distribution, Ecology, Speciation, ulation.
ntifiers: *Belgium, Bryophytes, Bryum argen- m, Cinclidotus danubicus, Clinclidotus fontina- les, Cinclidotus nigricans, Collema crispum, lytrichia mucronata, Didymodon spadiceus, ersion frequency, Homolathecium sericeum, pnum cupressiforme, Lunularia cruciata, Oc- iceras fontanum, Orthotrichia anomalum, hotrichia cupulatum var. nudum, Platyhypnidi- riparioides, Sambre, Schistidium apocarpum, ertical distribution.

e species, Octodiceras fontanum, can be con- ered strictly aquatic. This moss reacts poorly to idental emersion (exposure to the air). Two cies resist continuous immersion, but are ed to frequent emersion: Cinclidotus nigricans d C. danubicus. C. fontinaloides and Lunularia ciata prefer fairly prolonged emersion, but not excess. Dialytrichia micronata, Didymodon diceus, Orthotrichia cupulatum var. nudum, O. malum and the lichen Collema crispum require longed emersion. Platyhypnidium riparioides a broad ecological amplitude regarding quency of emersion, which permits it to grow in ost continuous immersion or in prolonged ersion. Accidental immersion is unfavorable to strictly terrestrial species, such as molathecium sericeum, Hypnum cupres- orme, etc. Schistidium apocarpum and Bryum enteum, although terrestrial, are only slightly luenced by temporary immersion. In general the tical transition between the populations is rper than expected from the potential ecologi- amplitude of the various species. In the case of olerant species, P. riparioides, the degradation of the environment by pollution enables it to effectively exploit its tolerance of frequent emersion. When ecological conditions become severe the number of species diminishes and the average frequency of species increases.--Copyright 1976, Biological Abstracts, Inc.

BEHAVIOR OF HYDRAZINE COMPOUNDS IN HARD AND SOFT WATER,
Air Force Systems Command, Wright-Patterson AFB, Ohio.
A. R. Slonim.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A019 401, Price codes: A03 in paper copy, A01 in microfiche. Aerospace Medical Research Laboratory, Report AMRL-TR-75-72, September 1975, 26 p, 5 tab, 1 fig, 9 ref.

Descriptors: *Water pollution sources, *Organic compounds, Physical properties, Hardness(Water), Alkalinity, Hydrogen ion concentration, Conductivity, Dissolved oxygen, Laboratory tests, Water quality, Biochemical oxygen demand.
Identifiers: *Hydrazine, 1,1-dimethylhydrazine, Unsymmetrical dimethylhydrazine, *Aerozine-50, Monomethylhydrazine, Hard water, Soft water, Propellant solution.

The behavior of hydrazine, 1,1-dimethylhydrazine (known as unsymmetrical dimethylhydrazine, UDMH), Aerozine-50, and monomethylhydrazine (MMH) in hard and soft water was studied prior to evaluating their effects on aquatic organisms. Hard and soft water propellant solutions were examined over a 96-hour period for changes in physical characteristics, phenolphthalein and total alkalinity, pH, specific conductance, EDTA hardness, and dissolved oxygen (DO). All four compounds at low concentrations (0.1 and 1.0 mg/l) had no effect on these variables, but at 100 mg/l produced changes that were significantly different between hard and soft water, indicating an appreciable amount of coordination of hydrazine compounds with calcium and other hard water ions. The oxygen level was reduced by all four compounds at 100 mg/l usually within the first day; in one detailed study, hydrazine in hard water caused the greatest drop in DO at 5 to 13 hours of exposure. In general, the propellant effects were not of a magnitude to preclude conducting acute toxicity tests in an open static bioassay. (Katz)

5C. Effects Of Pollution

EXPERIMENTAL NITRITE TOXICITY IN RAINBOW TROUT AND CHINOOK SALMON,
Bureau of Sport Fisheries and Wildlife, Bozeman, Mont. Fish Cultural Development Center.
C. E. Smith, and W. G. Williams.
Trans Am Fish Soc. 103(2), p 389-390, 1974.

Descriptors: *Toxicity, *Nitrites, *Rainbow trout, *Chinook salmon, Water pollution effects, Mortality.
Identifiers: Nitrate-nitrogen.

Two groups of 20 yearling rainbow trout (Salmo gairdneri) were exposed continuously to inflowing water containing 0.15 and 0.55 mg/liter nitrite as nitrite nitrogen (NO2-N), for 48 and 24 h, respectively. Both groups developed methemoglobinemia but mortality occurred only at the highest concentration (55%). Salmon (Oncorhynchus tschowytscha) exposed to 0.50 mg/liter NO2-N for 24 h developed methemoglobinemia and suffered a 40% mortality. Fingerling trout were less sensitive to nitrite than yearlings.--Copyright 1974, Biological Abstracts, Inc.

SEASONAL VARIATIONS IN CONCENTRATIONS OF NITRATE AND TOTAL PHOSPHORUS, AND CALCULATED NUTRIENT LOADING FOR SIX LAKES IN WESTERN NEW YORK,
State Univ. of New York at Buffalo. Dept. of Biology.
K. M. Stewart, and S. J. Markello.
Hydrobiologia. 44(1), p 61-89, 1974.

Descriptors: *Seasonal, *Nitrates, *Phosphorus, Soils, *Nutrients, Lakes, *New York, Water pollution effects.
Identifiers: England(Lakes).

Seasonal variations in concentrations and ranges of nitrate and total phosphorus were measured in 6 lakes (Conesus, Canadice, Honeoye, Devil's Bathtub, Java and Lime) of western New York. The variations may reflect the geochemistry of the area, local differences in lake hydrology and mixing characteristics, and the supply of nutrients from soil, man, and precipitation. Calculations, of nutrient (P) loading were made for the 6 lakes in New York, and compared to loading values for 9 English lakes. The specific values derived from the calculations cannot be considered absolute but they do indicate the relative importance of human vs. edaphic contributions and provide an aid in management consideration.--Copyright 1974, Biological Abstracts, Inc.

EFFECTS OF RECREATION ON WATER QUALITY IN WILDLANDS,
Colorado State Univ., Fort Collins, Colo. Dept. of Recreation Resources.
R. Aukerman, and W. T. Springer
Available from the National Technical Information Service, Springfield, VA 22161 as PB-251 104, Price codes: A03 in paper copy, A01 in microfiche. Eisenhower Consortium for Western Environmental Forestry Research, Fort Collins, Bulletin, No. 2, 28 p, Febuary, 1976. 1 fig, 36 ref, 7 tab.

Descriptors: *Water pollution, *Camping, *Recreation wastes, Water pollution sources, Wastes, Water pollution effects, Colorado, Bacteria, Roads, Camp sites, Turbidity, Dissolved oxygen, Water quality, Rocky Mountain region.
Identifiers: *Colorado Front Range, Wildlands.

The effect of present concentrations and varying types of campers upon water quality in the Colorado Front Range west of Fort Collins, Colorado, was studied. The eight campgrounds studied are heavily used, located along water, accessible by different types of access routes (paved and unpaved road and footpaths), and cater to different types of campers (motorized campers, camper-trailer, and backpack campers). Results indicate that recreational use is not at present a significant cause of bacterial water pollution, and ancillary monitoring shows that turbidity and dissolved oxygen concentrations are also unaffected by recreation use. In the case of motorized-camper campgrounds, provisions should be made to prevent vehicular approach to water bodies. (Witt-IPC)

PHYSICAL AND BIOLOGICAL EFFECTS OF THERMAL DISCHARGES AT LA CYGNE LAKE, VOLUME I: PROJECT REPORT,
Kansas Water Resources Research Inst., Manhattan.
G. P. Willhite, F. B. Cross, W. J. O'Brien, Y. S. Yu, and J. Wagner.
Completion Report, KWRRI Contribution No 174, July 1976. 160 p, 48 fig, 14 tab, 89 ref. OWRT B-032-KAN(1), 14-31-0001-3889.

Descriptors: *Mathematical models, Water quality, *Instrumentation, *Zooplankton, *Phytoplankton, *Fish population, *Thermal pollution, *Kansas.
Identifiers: *Thermal discharge effects, Power generation, *Temperature distributions, *Lake circulation, Wind stress, Predictive methods, *La Cygne Lake(Kan).

An interdisciplinary study was conducted at La Cygne Lake (1052 ha) in eastern Kansas in order to determine the physical and biological effects of thermal discharges from an 840 MW power plant. Results cover three years of study, including periods before and after plant start-up. Power generation was intermittent during the study. Temperature distribution and circulation patterns were controlled by interactions of wind stress on the surface of the water and the morphometry of the lake. Available predictive models were evaluated. Seasonal variations of temperature prior to power plant operation were predicted satisfactorily. Accurate prediction of temperature distribution caused by thermal discharge into the lake was not possible with available models. Particulate carbon, alkalinity and orthophosphate declined due to successional events, whereas hardness and sulfates increased with plant operation. Reduced abundance of Chlorophyll a near the discharge weir correlated with power production in the summer but not in winter. One species of zooplankton gained a competitive advantage in the lake after thermal discharge began. The relative abundance and age distribution of the fish population changed as a successional event. Fish were continuously attracted to the discharge region by plant induced circulation and increased temperature. No detrimental biological effects were observed. Application of La Cygne results to other reserviors is discussed. (See also W77-02617)

Descriptors: *Computer models, *Environmental effects, *Ecosystems, *New York, Diatoms, Population, Bioindicators, Trophic level, Eutrophication, Land use, Lakes.
Identifiers: *Lake George(NY), Multivariate analysis, Aquatic models, Terrestrial models, CLEANER computer model, LAND computer model.

Ecological modeling procedures are being used to study environmental impacts on Lake George, New York. A multivariate analytical approach, including cluster analysis and ordination, helps facilitate the interpretation and delineation of biotic responses to stresses, such as nutrient enrichment as shown by diatom death assemblages. General trends in nutrient enrichment were determined and a gradational series of patterns developed, resulting in a map of the nutrient stress on each part of the lake. Nutrient-enriched areas were adjacent to population centers and nutrient-poor areas in undeveloped parts. Aquatic and terestrial simulation models provide insights into complex relationships and, through perturbation analysis, permit evaluation of the consequences of environmental impact. CLEANER, an aquatic ecosystem model, represents functional ecologic and physiologic relationships. Stresses like changes in temperature, nutrients, and turbidity can be studied. Perturbations in the driving variables result in simulations that estimate the complex effects of environmental stress on all major ecosystem components. LAND, a terrestrial ecosystem and land-use model, is being developed to simulate land-use changes and vegetational succession. It subdivides the area and considers site-specific soil, slope, vegetational, aesthetic, and cultural characteristics of each. Coupled with CLEANER it will provide basin-wide analyses. Identifiers: *Catfish culture, *Catfish wastes, Biological degradation, BOD reductions.

A literature review and field study was undertal to determine the waste concentrations discharge loadings occurring in the waters fr catfish-culturing ponds and raceways. Wa quality analyses were performed on samples tal during a 240-day growing season and at drawdo (assuming drainage at harvest). The natural biol ical degradation of the raw wastes in the ponds raceway systems resulted in BOD reductions 96.8% and 98.0%, respectively, when compare waste levels produced in indoor single pass t systems with no waste removal facilities. Red tions in total nitrogen of 97.2% and 97.7% occur in ponds and raceways, respectively. Sedimer tion and biodegradation resulted in an 83. reduction in suspended solids in ponds and 86.2% suspended solids reduction in raceww Total phosphate levels were reduced by 98.5% ponds and raceways, respectively. Identifiers: *Antimony, *Antimony compoun Occupational diseases, Antimony industries, A timony dusts, Pneumoconiosis, Antimony toxi ty, Industrial antimony, Antimony trioxide, Tar emetic.

A comprehensive review of the literatu published since 1 January 1954 was conducted prepare this preliminary investigation report the physical and chemical properties of antimo

Sb) and its compounds, on the environmental factors related to their consumption and use, on the health and environmental effects resulting from exposure to Sb and antimonials, and on the regulations and standards governing their use. Antimony and its compounds, although not ranked among the biggest volume chemicals in the U. S., are industrially significant because of their contribution to the manufacture of many commonly-used products, such as alloys, paint, paper, plastics and textiles. Antimony trioxide (antimony oxide) is used to impart flame resistance to plastics, textiles, and other products. Antimony dusts have been associated with the development of pneumoconiosis in miners and other workmen. Some antimony compounds are toxic, or give rise to toxic decomposition products, but no serious occupational poisoning has been associated with the industrial use of antimony. (Katz)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 821, Price codes: A02 in paper copy, A01 in microfiche. Sea Grant College Program, Publication No. ORESU-T-75-003, November, 1975. 7 p., 1 tab., 1 fig., 2 ref.

Descriptors: *Ozone, *Oysters, *Toxicity, *Bioassay, Sea water, *Activated carbon, Water quality, *Mollusca, Larvae, Oxygen, Aquatic animals, Laboratory methods, Aquiculture, Water pollution effects.
Identifiers: *Residual toxicity, *Ozonized sea water, *Oxidizing agents, Water sterilization, Sea water culture systems, *Activated charcoal, Aquaculture systems, Ozone toxicity.

Ozone, a potent oxidizing agent, has found wide application in sterilization and control of water quality in fresh-water systems. However, its application to seawater culture systems has been limited by its residual toxicity. This paper describes a method which employs activated charcoal to remove this residual toxicity. The ozone-charcoal treatment sequence should prove beneficial in maintaining water quality for rearing even very sensitive organisms such as oyster larvae. (Katz)

THE MARINE BIOLOGICAL IMPACT OF THE HONOLULU GENERATING STATION,
Hawaii Univ., Honolulu. Sea Grant Program.
J. C. McCain, S. L. Coles, and J. M. Peck, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 369, Price codes: A04 in paper copy, A01 in microfiche. Sea Grant Technical Report UNIHI-SEAGRANT-TR-76-01, September, 1975. 50 p, 15 tab, 5 fig, 39 ref.

Descriptors: *Thermal pollution, Thermal stress, *Thermal water, *Water pollution effects, *Water temperature, Aquatic environment, Biological effects, *Environmental effects, Zooplankton, Marine fish, *Reefs, Hawaii, *Coral, Marine environment, Growth, On-the-site investigations, Daily hydrograph.
Identifiers: *Honolulu Harbor, Oahu, *Macrozooplankton, Reef canals, *Outfall jet plume, *Coral growth, *Fish standing crop, Intake basins, Discharge basins.

Studies of the effects of the Hawaiian Electric Generating Station on the zooplankton, reef corals, and fishes of Honolulu Harbor, Oahu, Hawaii were made during 1972-73. No distinct detrimental effects attributable to the generating station were revealed by these studies. The macrozooplankton community in the outfall basin more closely resembled communities sampled outside the harbor than elsewhere in the harbor, which receives a variety of pollutants. Differences in distribution and abundance of macrozooplankton were more closely related to depth and temporal differences than to power station discharge. Although reef corals were restricted from the wall directly in the path of outfall jet plume, the total coverage of live corals in the discharge basin exceeded that of the intake basin and discharge basin coral colonies were generally larger. Negligible coral growth was found anywhere else in the harbor. Fish standing crop in the discharge basin was estimated to be approximately twice that of the intake basin and little movement was noted between the two areas. Standing crop in both basins was generally higher than estimates for tropical and subtropical shallow water areas. No clear comparisons were possible concerning weight per unit length of fishes in the intake versus discharge basins. (Katz)

Identifiers: *Literature reviews.

Results of literature research on the biologic and health effects of Cr are summarized in this monograph. The literature evaluated covers available publications dating to July, 1972. The opening chapters discuss the properties of Cr, its distribution in the environment and its industrial uses. The subsequent chapters examine the biologic interactions of Cr, its necessity in nutrition, and its absorption, metabolism and excretion. The effects of Cr are studied in humans, aquatic species and vegetation. Results of experimental exposures of animals to Cr compounds are described and standards for Cr content of air and water in various countries are discussed. Conclusive results on the biologic effect of Cr are not provided since they were not available in the literature studied, but areas for future research are recommended. The appendix contains details for the analysis of Cr. An index and a reference list are included. This book will be valuable as a summation of information Cr.--Copyright 1974, Biological Abstracts, Inc.

A STATEMENT OF CONCERNS AND SUGGESTED ECOLOGICAL RESEARCH, REPORT NUMBER 1 OF THE LAKE MICHIGAN COOLING WATER STUDIES PANEL.
Lake Michigan Cooling Water Studies Panel, Chicago, Ill.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-248 131, Price codes: A17 in paper copy, A01 in microfiche. Report EPA-905/3-75-001, Nov. 1975. 382 p., 1 append.

Descriptors: *Freshwater fish, Aquatic life, *Lake Michigan, *Thermal power, *Thermal water, *Thermal power plants, Commercial fish, Biota, Benthos, Plankton, Aquatic algae, Crustaceans, Zooplankton, Phytoplankton, *Electric power, *Water temperature, Radioecology, *Thermal pollution.

A statement is presented of concerns and suggested research by the Lake Michigan Cooling Water Studies Panel. The intent of the statement is to assist the development of investigations of the effects of cooling water use on Lake Michigan. The introductory considerations of Lake Michigan are presented in the first section. The second section presents recommendations toward objective quantification of the effects of cooling water use through proper statistical planning, study design, and data collection. The remaining seven sections relate information the authors consider basic to an understanding of the effects of cooling use on physial and chemical aspect, primary producer and consumer communities, macrozoobenthos, fishery, entrapped and entrained organisms, and radioecology of Lake Michigan. All sections of the report attempt to produce improvement in research design and a trend toward standardization of results. In addition, questions are posed and ranked resulting in numerical priorities with the intent to guide research in those areas of knowledge which are barriers to an adequate understanding of the effects of cooling water use. MEDICAL AND BIOLOGIC EFFECTS OF ENVIRONMENTAL POLLUTANTS. VANADIUM.
National Research Council, Washington, D. C. Committee on Biologic Effects of Atmospheric Pollutants.
National Academy of Science: Washington, D.C., 1974. 113 p. $5.25.

Descriptors: Water pollution effects, Environmental effects, *Reviews, Bibliographies, Water pollution sources, Pollutant identification, Air pollution, Metabolism, Soils.
Identifiers: *Vanadium.

This report by the Panel on Vanadium summarizes the available data on the biologic effect of environmental compounds. The text begins with a discussion on industrial processes and uses involving V and its compounds. Contamination resulting from handling of V residues is examined. The source of V in the ambient air and in the environment are dealt with and emission of V into the air due to combustion of coal and oil, and V concentration in the atmosphere, earth's crust, water, plants, animals and food was covered. The chapter on the biologic effects of V examined the effects on man, experimental animals and on metabolism. Recommendations for future research areas on or related to the biologic effects of V are included. The appendix contains discussions on desulfurization of residual fuel oils and the detection and measurement of V in biologic and pollution materials. Over 200 references are listed and an index is included.--Copyright 1974, Biological Abstracts, Inc.

ASPECTS OF CARBON METABOLISM IN FILAMENTOUS MARINE FUNGI,
Florida Atlantic Univ., Boca Raton. Dept. of Biological Sciences.

P. L. Sguros.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-022 474, Price codes: A02 in paper copy, A01 in microfiche. Final Report to Office of Naval Research, (Washington D. C.), Microbiology Branch, Contract No. N00014-67-A-0320-0002, April 1976. 16 p., 18 ref.

Descriptors: *Degradation, *Marine microbiology, Aquatic fungi, *Marine fungi, *Biodegradation, *Microbial degradation, *Plant physiology, *Biochemistry, Laboratory techniques, Phytoplankton, Mode of Action, Nitrogen, Carbohydrates.
Identifiers: *Carbon metabolism, *Filamentous marine fungi.

A nutritional screening of 117 carbon and/or nitrogen sources against marine fungal cultures revealed poor acceptance of any compound as both C and N source, broad flexibility in accepting nitrogen sources, and a very narrow restriction of C sources to a few cellulose-associated carbohydrates. Oxidative dissimilation of glucose resulted in almost total conversion to cell substance and carbon dioxide. Cell substance averaged 45% C, 5.4% N, and 5.9% H. Economic coefficients averaged 76% decreasing as substrate glucose concentrations increased. Enzymatic studies revealed that glucose can be metabolized by the Embden-Meyerhof-Parnas, pentose glyoxylate bypass. The cellulase complex was found to consist of three inducible agents: hydrocellulase, glucanase and cellobiases, the first two being primarily exocellular and the latter intracellular. Glucanase and cellobiase were favored by pH 5-6 at 37 C, while the former was stable over pH 3-9 and the latter from 5-9 at 37 C. Both enzymes were deactivated in 15 min at 100 C. Cellobiose was a strong inducer of cellulase and Tween 80 stimulated cellulolytic activity greatly. (Katz)

INVESTIGATION OF SELECTED POTENTIAL ENVIRONMENTAL CONTAMINANTS: HALOETHERS,
Syracuse Univ. Research Corp., N. Y., Life Sciences Div.
P. R. Durkin, P. H. Howard, and J. Saxena.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-246 356, Price codes: A09 in paper copy, A01 in microfiche. Report EPA-560/2-75-006, September, 1975, 168 p, 43 tab, 23 fig, 171 ref.

Descriptors: Public health, *Toxicity, *Environmental sanitation, Human pathology, Potable water, Water pollution, Water quality, Chemical industry, *Chemical wastes, Chlorides, Fluorides, Environmental effects, *Reviews, *Bibliographies, Solvents, Mammals.
Identifiers: *Haloethers, bis(chloromethyl)ether, Chlorex, bis(2-chloroethyl)ether, bis(2-isopropyl)ether, a-chloroethers, B-chloroethers, ion exchange ethers.

A review is presented of the potential environmental hazard from the commercial use of haloether compounds. The fluorinated anesthetic ether, methoxyfurane (2,2-dichloro-1,1-difluoroethyl methyl ether) and fluroxene (2,2,2-trifluoroethyl vinyl ether), and only peripherally treated. Major focus is on the a-chloroethers, bis(chloromethyl)-ether and chloromethyl methyl ether, and the B-chloroethers, bis(2-chloroisopropyl)-ether, bis (2-chloroethyl) ether, and bis (2-chloroethoxy) methane. The a-chloroethers are used as chemical intermediates for production of ion exchange resins while the B-chloroethers are used mostly for solvents but have some chemical intermediate uses. Information on physical and chemical properties, production methods and quantities, commercial uses and factors affecting environmental contamination, as well as information related to health and biological effects, are reviewed. PROCEEDINGS OF THE TWENTY-EIGHTH ANNUAL GULF AND CARIBBEAN FISHERIES INSTITUTE.
Rosenstiel School of Marine and Atmospheric Science, Miami, Fla.
Held at Bal Harbour, Florida, October 1975. Published in May 1976, 123 p.

Descriptors: *Continental Shelf, *Resources development, *Water pollution effects, *Legal aspects, *Fishing gear, *Fish management, Conferences, Economics.
Identifiers: *Outer Contiental Shelf, Jurisdiction, Echo sounding.

Four groups of papers constitute the proceedings of twenty-eighth annual Gulf and Caribbean Fisheries Institute. The Fisheries Jurisdiction Session consisted of papers on: The New Ocean Regime; The Status of Extended Jurisdiction over Our Fishery Resources; Interstate Marine Compact Commissions--Role in Fisheries Management; Suggested State Legislation for Effective Management of Marine Fisheries; Florida's Position Regarding HR 200 (Extended Jurisdiction); and The Western Central Atlantic Fishery Commission (WECAFC): Its Implications and Impact. The Continental Shelf Session papers were: Multiple-use Conflicts between Fishermen and other Users of the Ocean with a Consideration of a Possible Expanded Federal Role; Identification and Mapping of Fishing Banks on the Outer Continental Shelf of the Gulf of Mexico; Current Studies toward the Protection of the Environment in the MAFLA Area; and Contaminant Effects on Biota of the New York Bight. Papers of the Fisheries Biology Session are: Gear and Economic Efficiency Results of a Sea Grant Twin-Trawl; Abundance and Potential for Fisheries; Aquarium Fish Hobby; Progress toward Management of the Atlantic Bluefin Tuna; Outline for a Southeastern Regional Recreational Fishery Program Development Plan and Status Report of Florida's Research on the Spiny Lobster Biology. The final session was a Fisheries Workshop. (NOAA)

MARINE POLYCULTURE BASED ON NATURAL FOOD CHAINS AND RECYCLED WASTES,
Woods Hole Oceanographic Institution, Mass.
J. H. Ryther.
Woods Hole Oceanographic Institution Technical Report No. WHOI-76-92, October 1976, 281 p. SG-04-6-158-44016.

Descriptors: *Aquiculture, *Marine algae, *Recycling, Waste water treatment, *Food chains, Effluents, Mollusks, Nutrients, Crustaceans, Solid wastes, Shellfish, Sewage treatment.
Identifiers: Recycled wastes, Finfish, Sea weeds.

Research has continued during the past fiscal year on the development, testing, and evaluation of a combined waste recycling-marine polyculture system. The concept of the system is to grow unicellular marine algae (Phytoplankton) in mixtures of seawater and the effluent from a secondary sewage treatment plant. The algae grown in continuous flow-through cultures, are then fed to bivalve molluses, such as oysters, clams, scallops, or mussels. The algae remove the nutrients from the wastewater and the molluscs remove the algae. Finfish (winter flounder) and crustacea (American Lobster) are stocked as post-larval or juvenile animals together with the molluscs to feed upon the solid wastes (feces and pseudo feces) produced by the shellfish and upon the small in-

ebrate fauna (polychaete worms, amphipods, that are supported by these wastes. Seaweeds titute a final polishing stage to the system, ving the effluent from the animal culture m and removing from it nutrients regenerated gh excretion and metabolism of the animals ell as any nutrients from the wastewater not lly removed by the phytoplankton. Twelve re- by various authors are compiled in this ne. (NOAA)

ABSTRACTS. SPECIAL SYNPOSIUM - THE MIDDLE ATLANTIC CONTINENTAL SHELF AND NEW YORK BIGHT,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
M. G. Gross.
Held at American Museum of Natural History, New York City, NY on November 3-5, 1975. 79 p.

Descriptors: *Abstracts, *Continental Shelf, Marine biology, Marine fisheries, Marine geology, Oceanography, Ocean circulation, Meteorology, Environmental effects, Water pollution sources, Water pollution effects, Ecology, Pollutants, Ecosystems, Waste disposal, Conference.
Identifiers: *Outer Continental Shelf, *New York Bight, Middle Atlantic Continental Shelf, Coastal zone, Marine Ecosystems Analysis Program(MESA).

This is a collection of abstracts of 42 papers presented at a special symposium on the Middle Atlantic Continental Shelf and New York Bight. Subjects encompass all aspects of the marine sciences and fisheries, contamination or pollution and its effects on the environmental and aquatic communities. Interactions between the ocean and atmosphere are dealt with along with various pertinent aspects of marine meteorology. (NOAA)

THE METULA OIL SPILL,
National Oceanic and Atmospheric Administration, Boulder, Colo. Marine Ecosystems Analysis Program Office.
C. G. Gunnerson, and G. Peter.
Available from Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402. NOAA Special Report, September 176. 42 p, 18 fig, 4 tab, 9 ref, 2 append. Also in Spanish.

Descriptors: Aquatic life, *Oil spills, *Oil pollution, *Water pollution effects, *Tidal marshes, Environmental effects, *Baseline studies, *Intertidal areas, *Coastal marshes, *Estuarine environment, Beaches, Continental shelf, Cold regions, South America.
Identifiers: Outer Continental Shelf, *Strait of Magellan, Tierra del Fuego, Environmental impact, Supertankers, Crude oil.

In August 1974 the supertanker METULA ran aground in the Strait of Magellan and spilled over 50,000 tons of light Arabian crude oil. The spill was not contained and the oil was carried over large segments of beaches and tidal marshes of Tierra del Guego, and deep into the estuaries of the area. Findings of a team of scientists from the United States and Chile, who investigated the environmental damage in August 1974 and again in January 1975, and of others who discussed the spill at a workshop, are summarized. Included are the background of the accident, the physical environment, the reasons why cleanup measures were not attempted, and the most important follow-up research needs. The research results will be used to identify critical environmental information that can be transferred for use in planning and for predicting environmental impacts in other similar areas of the world. (NOAA)
W77-02679

THE EFFECTS OF TEMPERATURE ON DISEASES AND THEIR HISTOPATHOLOGICAL MANIFESTATIONS IN FISH,
R. J. Roberts.
In: The Pathology of Fishes, W. E. Ribelin, ed., The University of Wisconsin Press, Madison, Wisconsin, p. 477-496, 1975. 7 fig., 37 ref.

Descriptors: *Fish diseases, *Pathology, *Pathogenic fungi, *Temperature, *Bacteria, *Viruses, *Epidemiology, *Pathogenic bacteria, *Infection, *Zoonoses, Aquiculture, Fish farming, Salmonids, Channel Catfish, Diseases, Microbiology, Heated water, Streptococcus, Aquatic microorganisms, Parasitism.

Bacterial, viral and parasitic diseases and the effect of temperature on the course of these diseases in teleosts is discussed. The pathogenicity of these infectious agents is closely tied to temperature, both in the viability of the organism at a given temperature and in the vulnerability of the fish. Defense mechanisms of the fish are examined in terms of their effectiveness at various temperatures. Skin lesions, a major route of infection, heal slowly at 4C with little cellular inflammatory response, while at 14C there was rapid epithelialization. The fixed macrophage system, circulating antibodies, antiferons and circulating leukocyte systems in fish are discussed. (Katz)
W77-02692

LESIONS ASSOCIATED WITH CHRONIC EXPOSURE TO AMMONIA,
C. E. Smith, and R. G. Piper.
In: The Pathology of Fishes, W. E. Ribelin, ed., The University of Wisconsin Press, Madison, Wisconsin, 1975, p 497-514. 1 tab., 6 fig., 29 ref.

Descriptors: *Aquiculture, *Rainbow trout, *Trout, Water quality, *Fish diseases, *Fish farming, *Fish toxins, *Fish physiology, *Dissolved oxygen, *Ammonia, Mortality, Sport fish, Nitrogen compounds, Water pollution sources, Water pollution effects, Microscopy, Growth rates.
Identifiers: *Histology, *Gills.

Rainbow trout were exposed to ammonia concentrations of approximately 0.5, 1.0 and 1.5 ppm as total ammonia for 12 months. When compared to controls, growth of trout was not affected after four months' exposure to 1.0 and 1.5 ppm ammonia. There was a significant reduction in growth after 6 and 12 months for fish reared in 1.6 ppm. Mortality was the same in test and control groups. Pathological changes were observed in gills and livers exposed to 1.6 ppm ammonia for 6 months. As long as oxygen concentrations are kept at 5.0 ppm, it is unnecessary and impractical to maintain ammonia concentrations at 0.1 ppm when rearing rainbow trout. (Katz)
W77-02693

THE PATHOLOGY OF PESTICIDE POISONING,
A. H. Walsh, and W. E. Ribelin.
In: The Pathology of Fishes, W. E. Ribelin, ed., University of Wisconsin Press, Madison, Wisconsin, 1975. p. 515-541. 10 tab., 39 ref.

Descriptors: *Pesticides, *Pathology, *Salmonids, *Lake Trout, *Bioassay, *Fishkill, *Toxins, Water pollution effects, Analytical techniques, *Pollutant identification, Reviews, *2,4-D, *DDT, Chlorinated hydrocarbon pesticides, Laboratory tests, Microscopy.
Identifiers: *Histology, *Carbaryl, *Atrazine, *Coho salmon.

Laboratory tests were conducted in which coho salmon (Oncorhynchus kisutch) and lake trout (Salvelinus namaycush) were exposed to several pesticides and then examined for gross and microscopic tissue changes. Comparison between results of this experimentation and observations from the literature are made. Hyperplasia of gill lamellar epithelium, a suggested result of pesticide exposure, was more common in control fish than in test fish in these tests. 'Shrunken' spleens and reduction in the number of lymphocytes in spleens of exposed fish occurred after exposure to seven pesticides. Hyperemia in the brains of coho salmon and lake trout exposed to 2,4-D may prove to be of diagnostic value in determining the toxic agent in a fishkill. Behavioral changes could only be properly assessed in laboratory experiments, except for carbaryl (Sevin) and atrazine which cause changes that could be evaluated in the field. Data from these studies and those reviewed were inconclusive in identifying characteristic lesions from any group or class of pesticide for diagnostic purposes. In all cases, except with carbaryl and atrazine, historical or analytical evidence is necessary to identify the pesticide. (Katz)
W77-02694

HISTOPATHOLOGICAL EFFECTS OF PESTICIDES AND RELATED CHEMICALS ON THE LIVERS OF FISHES,
J. A. Couch.
In: The Pathology of Fishes, W. E. Ribelin, ed. The University of Wisconsin Press, Madison, Wisconsin, 1975. p. 559-584. 2 tab., 18 fig., 26 ref.

Descriptors: *Pathology, *Pesticides, *DDT, *Aroclors, *Chlorinated hydrocarbon pesticides, *Organophosphorous pesticides, Reviews, Data collections, *2,4-D, *Endrin, *Bioassay, *Heptachlor, *Insecticides, *Fish diseases, Herbicides, Rainbow trout, Sunfishes.
Identifiers: *Fish livers, Histology, Lindane, Methoxychlor, Telodrin, Malathion, Dursban, Carbaryl, TFM.

A review of controlled field and laboratory research investigating the pathologic effects of pesticides and related chemicals on the livers of fishes is presented. Few fish and pesticides have been tested which may account for the failure to identify specific syndromes resulting from pesticide exposures. Cutthroat trout exposed to endrin had a large spectrum of lesions constituting a prehepatomatous syndrome. Early necrotic, coagulative lesions were associated with the portal triads of rainbow trout exposed to critical levels of lindane. Bluegills exposed to methoxychlor had unique, eosinophilic globular masses in the liver vascular system. The most commonly encountered nonspecific liver lesion for fish following pesticide exposure was fatty change. Further histological and cytological investigation is indicated to further define and characterize effects of pesticides on the livers of fish and to study possible interactions of variables such as nutrition and pesticides. (Katz)
W77-02695

CELLULAR EFFECTS OF MERCURY ON FISH KIDNEY TUBULES,
B. F. Trump, R. T. Jones, and S. Sahaphong.
In: The Pathology of Fishes, W. E. Ribelin, University of Wisconsin Press, Madison, Wisconsin, 1975. p. 585-612. 1 tab., 17 fig., 25 ref.

Descriptors: *Osmosis, *Inhibition, *Mercury, *Fish physiology, Pathology, *Fish diseases, *Teleosts, *Cytological studies, *Membrane processes, *Permeability, *Biological membranes, Laboratory tests, Analytical techniques, Methodology, Membrane processes, Heavy metals, Water pollution effects.
Identifiers: *Kidney function(Fish).

Kidney function and structure in teleosts is described. Experiments to further describe kidney function, both in vitro and in vivo are presented, including the effects of several mercury compounds on kidney function in vitro. Mercury is believed to bind with SH groups on surface membrane proteins which may inhibit ATPase. Leak may result with leak-in of sodium and leak-out of potassium with subsequent volume shifts in the cell. Calcification of the mitochondria, one important type of nephrocalcinosis, may occur as a result of high sodium concentrations inhibiting mitochondrial respiration. The basic mechanism of mercurial action is probably due to binding to SH groups. The important lesion is probably an interaction involving cell membrane permeability (Katz)
W77-02696

EFFECTS OF TURBIDITY ON VENTILATION RATES AND OXYGEN CONSUMPTION OF GREEN SUNFISH, LEPOMIS CYANELLUS,
North Texas State Univ., Denton. Dept. of Biological Sciences
J. D. Horkel, and W. D. Pearson
Transactions of American Fisheries Society, Vol 105, No. 1, p 107-113, 1976. 5 fig., 2 tab., 10 ref.

Descriptors: *Turbidity, *Suspended solids, Fish behavior, *Fish physiology, *Adaptation, Environmental effects, *Sunfishes, *Oxygen, *Respiration, Water pollution effects, *Temperature, *Oxygen requirements, Aquatic environment, Metabolism, Laboratory tests, Analytical techniques, Fish
Identifiers: *Lepomis cyanellus

Ventilation and oxygen consumption rates of green sunfish exposed to bentonite clay suspensions were measured at several temperatures. Ventilation rates were not affected by bentonite clay suspensions below 2,125 FTU (Formazin Turbidity Units) at 5 C, 1,012 FTU at 15 C, and 898 FTU at 25 C. At turbidity levels exceeding 1,012 FTU at 15 C and 898 FTU at 25 C ventilation rates increased 50-70%. Tests were inconclusive at 35 C due to high mortality. Oxygen consumption rates were not affected by turbid suspensions of up to 3,500 FTU at any of the four temperatures. Evidence suggests that increased ventilation rates under slightly turbid conditions are a means of compensating for reduced respiratory efficiency in order to maintain a constant oxygen uptake. The costs of increased ventilation rates were probably met by a reduction in activity. (Katz)

TOXICITY OF THE SURGEON FISHES-II PROPERTIES OF THE PRINCIPAL WATER SOLUBLE TOXIN,
Tohoku Univ., Sendai (Japan). Faculty of Agriculture.
T. Yasumoto, R. Bagnis, and J. P. Vernoux.
Bulletin of the Japanese Society of Scientific Fisheries, Vol 42(3), p 359-366, 1976. 1 tab, 3 fig, 12 ref.

Descriptors: *Toxicity, *Mortality, *Public Health, *Marine biology, *Marine fish, *Toxins, *Algal toxins, *Fish toxins, *Venom, Marine microorganisms, Biochemistry, Bioassay, Pollutant idententification.
Identifiers: *Surgeon fish toxicity, Surgeon fish, Ciguatoxin, Mailotoxin, Ichthytoxin, Phytoflagella, Prymnesium parvum.

Specimens of surgeonfish Ctenochaetus striatus collected in Tahiti contained a water-soluble toxin in addition to ciguatoxin. The water-soluble toxin was tentatively named mailotoxin (MT) after the Tahitian name for surgeonfish maito. Purificat of MT was achievable by the standard purificat procedures for polar lipids. The toxin was elu from a silicic acid column with chlorofo methanol (6:4) and from a cellulose column w chloroform-methanol-water (5:15:1). Upon gel tration through Sephadex G-25, it appeared in fractions near void volume. Acid hydrolysis of toxin afforded fatty acids, glucose and galacto and 15 amino acids. The minimum lethal dose mice by intraparitonial injection was estimated be 15 to 20 mg/kg. Guppies put in 40 ppm solut of MT died within 150 min. These chemical physiological properties indicated a close simil ty of MT to the ichthyotoxin produced by phytoflagellate Prymnesium parvum. (Katz)

STUDIES ON THE METABOLISM CHLOROPHENOLS IN FISH-VI TURNOV OF ABSORBED PHENOL IN GOLDFISH,
Kyushu Univ., Fukuoka (Japan). Lab. of Fishe and Chemistry.
K. Kobayashi, H. Akitake, and S. Kimura.
Bulletin of the Japanese Society of Scient Fisheries, Vol 42, No 1, p 45-50, 2 tab, 2 fig, 6 re

Descriptors: *Toxicity, Bioassay, Freshwa fish, Biochemistry, Animal physiology, *Path pollutants, *Metabolism, Liquid wastes, Labo tory animals, Laboratory tests, Industrial was Organoleptic properties, Taste, *Phenols
Identifiers: *Chlorophenols, Absorbed phe *Goldfish, Excretion, Organ phenol concen tion, Biliary excretion, Tissue concentration.

A study has been made regarding the turnove absorbed phenol in various organs of goldf Carassius auratus, during absorption in a phe medium (15 ppm) and its subsequent excretio running water. Although the absorbed phenol cumulated in various organs, the phenol conc tration in each organ, except gall bladder, was most constant after 2 hr of exposure and rap decreased after transfer of the fish from phenol-medium to running water. The phenol c centration in the gall bladder, however, increa with exposure time, even after fish had been tra ferred to running water, and reached a maxi value of 214.7 microgram/gram at 1-hr cultur running water. The phenol concentration in gall bladder decreased to 144.7 microgram/gra the end of the excretion period (for 24 hr), bu amount accounted for 37% of the total phenol tected. The characteristic accumulation of phe in the gall bladder indicates that the biliary ex tion of phenol from the liver, probably after detoxication by sulfate conjugation, is an imp tant mechanism for the disposition of pheno fish, as well as for that of pentachlorophenol. also W75-10417; W75-10418; W75-10611; W77-02702) (Katz)

STUDIES ON THE METABOLISM CHLOROPHENOLS IN FISH-VII SULFA CONJUGATION OF PHENOL AND PCP FISH LIVERS,
Kyushu Univ., Fukuoka (Japan). Lab. of Fishe and Chemistry
K. Kobayashi, H. Akitake, and S. Kimura.
Bulletin of the Japanese Society of Scient Fisheries, Vol. 42(2), 1976, p 171-177, 1 tab fig., 14 ref.

Descriptors: *Organoleptic properties, Ta *Toxicity, Freshwater fish, Biochemistry, Ani physiology, *Path of pollutants, *Metaboli Laboratory animals, Laboratory tests, Indust wastes, Trout, Carp, Clams, Lobsters, *Phenol
Identifiers: *Chlorophenols, Sulfate, Conjugat Goldfish, Rainbow trout, Spiny lobster, Sh necked clam, Liver, *Pentachlorophenol

The sulfate conjugation of phenol and p tachlorophenol (PCP) in vitro by liver slices

genates from goldfish, carp, rainbow trout, lobster and shortnecked clam has been stu- and compared with that by albino rat liver, 35S-labeled K2S04. All the liver slices of the nimals showed sulfate conjugation activity phenol, the level of activity being 1-30% of n rat liver (approx. 1.8 micro mole/g dry hr). However, the liver homogenates had ac- s which were markedly lower than those n by the liver slices. On the other hand, PCP l to the incubation mixture containing liver not only did not conjugate with sulfate, but ncentrations higher than 1.4 x 10-6M, it in- d the sulfate conjugation of phenol. In short- d clam and goldfish, absorbed PCP is rapidly ted after conjugation with sulfate. (See also 10417; W75-10418; W75-10611; and W77-) (Katz)

ifiers: *Bioaccumulation, *Tissue analysis.

enaria mercenaria fed Aroclor 1254 adsorbed the surface of alumina particles at 1.25 and parts/109 seawater for 21 days showed a max- concentration factor of 1.8 x 103 with ral mass:muscular foot residues of less than general. In clean seawater, only the muscu- ot of clams, showed a diminution in PCB nt after six months. PCB levels in visceral muscular foot:surface mud for clams in ampton water are in the ratio of 2:1:2. Tissue les contained relatively more lower inated isomers compared with the Aroclor ard while feces and mud samples showed an ased proportion of higher chlorinated PCB rs. Clams may exert both a qualitative and a itative effect upon the distribution of PCB in tuarine ecosystem. (Katz)

ERVATIONS ON GAS BUBBLE DISEASE NG WILD ADULT COLUMBIA RIVER ES,
llis Environmental Research Lab., Oreg. ern Fish Toxicology Station.
Bouck, G. A. Chapman, P. W. Schneider, nd D. G. Stevens.
actions of American Fisheries Society, Vol No 1, p 114-115, 1976. 6 ref.

riptors: Environmental effects, *Fish dis- , Pathology, Dams, *Supersaturation, ogen, *Gases, *Salmonids, *Sockeye Sal- *Salmon, *Trout, Fishkill, Sampling, Sport Bubbles, Commercial fish, *Columbia River.
ifiers: *Gas bubble disease, Emphysema, d, *Steelhead, *Dissolved gases.

A high incidence of gas bubble disease was found among salmonids and shad sampled from the air-supersaturated Columbia River. One sampling in 1972 showed macroscopic dermal emphysema (bubbles) on 47% of sockeye salmon, 40% of steelhead trout (Salmo gairdneri) and 26% of American shad (Alosa sapidissima). No evidence of gas bubble disease was seen on the external surfaces of lampreys. Post-capture eye damage to sockeye salmon, resulting in perforation of the cornea and blindness, may also be related to supersaturation of the river. (Katz)

LEAD UPTAKE IN TWO MARINE PHYTOPLANKTON ORGANISMS,
Scripps Institution of Oceanography, La Jolla, Calif.
M. Schulz-Baldes, and R. A. Lewin.
Biological Bulletin, Vol. 150, p. 118-127, February, 1976. 3 tab., 6 fig., 13 ref.

Descriptors: *Adsorption, *Phytoplankton, *Diatoms, *Lead, *Path of pollutants, *Bioassay, *Food webs, *Food chains, Laboratory tests, Chelation, Membrane processes, Analytical techniques, Pollutants.
Identifiers: *Phaeodactylum, *Platymonas, *Binding sites.

The uptake of lead by Phaeodactylum tricornutum and Platymonas subcordiformis, two marine phytoplankton, exposed to lead concentrations ranging from 0.02 to 0.8 mg/l, occurs in two phases. The first phase was completed within minutes after addition of lead and could be described by a Freundlich adsorption isotherm. The number of binding sites per all seemed to be limited. Cells of Phaeodactylum became 'saturated' when the lead burden reached 11,640 micrograms/gr (dry weight). EDTA added to the solution completely inhibits the uptake of lead by Phaeodactylum cells. When diatom cells, pretreated with lead, are resuspended in EDTA, much of the adsorbed lead is eluted with a longer pre-treatment period leading to a higher lead retention by the cell. This suggests that during prolonged exposure to lead solutions the metal ions are first adsorbed to the cell surface and then translocated to within the cell wall, to the plasma membrane, and then to the cytoplasm. THE MUDDY RUN PUMPED STORAGE PROJECT: A CASE HISTORY,
Ichthyological Associates, Inc., Drumore, Pa.
T. W. Robbins, and D. Mathur.
Transactions of American Fisheries Society, Vol 105, No 1, p 165-176, 1976. 2 fig, 13 ref.

Descriptors: *Pumped storage, *Reservoirs, *Mortality, Powerplants, Ecology, *Fish reproduction, *Sampling, Biomass, Sport fish, Reproduction, Pump turbines, Water quality, Catfish, Sunfishes, Fish populations, Fish eggs, Larval growth stage.
Identifiers: *Muddy Run Pumped Storage Project(Penn), Pomoxis sp, Ictalurus sp, Susquehanna River, Conowingo Pond(Penn).

The ecology of Conowingo Pond and the Muddy Run Pumped Storage Pond on the lower Susquehanna River was studied to determine the effects of the Muddy Run Pumped Storage Station. Nearly all species of fish present in the lower pond appeared in the upper pond. Extensive sampling in both ponds shows no detrimental effects of station operation in the fishes and fisheries of Conowingo Pond. The upper pond serves as an area where biomass of fishes pumped up from Conowingo Pond can be increased. About 6.5 times as many fish larvae were pumped into the upper pond as left during generation. No estimates could be obtained on the percentage mortality of fishes passing through the pump turbines. The mortality of fishes associated with the operation of the pumped storage station appears to be negligible and screens are not needed for protection. (Katz)

LETHAL AND PREFERRED TEMPERATURES OF THE ALEWIFE (ALOSA PSEUDOHARENGUS) IN LAKE MICHIGAN,
Industrial BIO-TEST Lab., Inc., Northbrook, Ill.
R. G. Otto, M. A. Kitchel, and J. O. Rice.
Transactions of American Fisheries Society, Vol. 105, No. 1, p. 96-106, 1976. 4 tab., 7 fig., 16 ref.

Descriptors: *Heated water, *Temperature, Environmental effects, *Juvenile growth stage, *Lethal limit, *Mortality, *Seasonal, *Water temperature, *Fish behavior, *Resistance, Aquatic environment, *Electric powerplants, *Lake Michigan, Laboratory tests, Water pollution sources, Water pollution effects, Thermal water, Powerplants, Fish, Food webs, Water quality.
Identifiers: Acclimation, *Temperature preference, *Alewife, *Alosa sp.

The temperature tolerance and temperature preference of mature and young-of-year alewives from Lake Michigan were studied in the laboratory. Critical thermal maxima and incipient upper lethal temperatures increase with acclimation temperature for both mature and young-of-year fish. Critical thermal maxima at equivalent acclimation temperatures are unaffected by age of the fish. Incipient upper lethal limits for young-of-year fish exceed those for mature fish by 3C to 6C. The ultimate lower lethal temperature for mature alewives appears to exceed 3C. Loss of heat tolerance following a 10C decrease in temperature occurs at approximately one-half the rate of gain of heat tolerance following a comparable temperature increase. Preferred temperatures for young-of-year alewives were consistently higher than those of mature fish. Seasonal factors other than lake temperature appear to be of considerable importance in determining preferred temperatures. The results are discussed in terms of potential effects of the heated plume from a nuclear generating station and available field data. (Katz)
W77-02710

CHANGES IN FISH SPECIES COMPOSITION IN THE AU SABLE RIVER, MICHIGAN FROM THE 1920'S TO 1972,
Institute for Fisheries Research, Ann Arbor, Mich.
J. S. Richards.
Transactions of American Fisheries Society, Vol. 105, No. 1, 3 tab., 6 fig, p. 32-40, 1976.

Descriptors: habitats, *Rainbow trout, *Brown trout, *Brook trout, *Fish populations, Water quality, Environmental effects, *Trout, *Post-impoundment, Rivers, On-site investigations, Population, Aquatic populations, Pre-impoundment impoundments, Sport fish, Methodology, *Michigan.
Identifiers: *Species diversity, *Au Sable River(Mich).

Fish collections taken in the 1920's from the Au Sable River, Michigan, were replicated in 1972. The Au Sable system as a whole has remained a non-rigorous, predictable environment for fish species. Substantial changes in fish species lists have occurred at most stations. The percentage of cold-water species present in the cold-water, moderate flow areas has increased, while species diversity evenness, and numbers of species have remained constant. The warm headwater areas remain unchanged. Below the impoundments and in the large river areas, water quality has changed with subsequent reductions in species diversity and evenness, and large changes in species lists. (Katz)
W77-02712

DDE AND LINDANE IN A LARGE-SCALE MODEL LENTIC ECOSYSTEM,
Purdue Univ., Lafayette, Ind. Dept. of Forestry.
J. L. Hamelink, and R. C. Waybrant.
Transactions of American Fisheries Society, Vol. 105, No. 1, p. 124-134, 1976. 1 fig., 5 tab., 32 ref.

Descriptors: *Sediment-water interfaces, *Model studies, *Path of pollutants, *Pesticides, *DDE, *Pesticide residues, *Lentic environment, *Absorption, *Sunfishes, *Rainbow trout, *Trout, *Persistence, *Sediments, Standing waters, Zooplankton, Chlorinated hydrocarbon pesticides, Food webs, Thermal stratification, Quarries, Insecticides, Analytical techniques, Bass, Bottom sediments.
Identifiers: *Bioaccumulation, *Lindane, *Lepomis sp.

The fate of DDE and lindane added to the epilimnion of a thermally-stratified, flooded limestone quarry was followed for one year. DDE was distributed rapidly throughout the system, due to an influx of sediment generated by a rainstorm, while lindane persisted in the epilimnion until turnover. Concentration factors for zooplankton at equilibrium averaged 33 for lindane and 4.5 x 104 for DDE, while the same values for bluegill were 768 and 1.1 x 105, respectively. Rainbow trout planted 134 days after treatment showed a concentration factor for DDE of 1.8 x 105 within 108 days, even though less than 1 part per trillion of DDE remained in the water. The distributions of DDE and lindane in the system were controlled chiefly by sediment-water interactions. (Katz)
W77-02713

EFFECT OF SHEAR ON EGGS AND LARVAE OF STRIPED BASS, MORONE SAXATILIS, AND WHITE PERCH, M. AMERICANA,
Maryland Univ., Solomons. Chesapeake Biological Lab.
R. P. Morgan, II, R. E. Ulanowicz, V. J. Rasin, Jr, L. A. Noe, and G. B. Gray.
Transactions of American Fisheries Society, Vol. 10, No. 1, p. 149-154, 1976. 3 tab., 1 fig., 13 ref.

Descriptors: *Fish eggs, Larvae, *Larval growth stage, *Lethal limit, *Environmental effects, *Fish reproduction, *Striped bass, *White perch, Shear, Velocity, Stress, *Shear stress, *Mortality, *Fishkill, Immature growth stage, Laboratory tests, Methodology, Marine fish, Ships, Reproduction, Sea basses, Flow, Pathology, Analytical techniques, Canals.
Identifiers: *Morone sp.

Shear stress, generated by water movement, can kill fish eggs and larvae by causing rotation or deformation. Through the use of an experimental apparatus, a series of shear (as dynes per square cm) - mortality equations for fixed time exposures were generated for striped bass and white perch eggs and larvae. Exposure of striped bass eggs to a shear level of 350 dynes per square cm killed 36% of the eggs in 1 min, 69% in 2 min., and 88% in 4 min. Exposure of larvae to the same conditions kills 9.3% in 1 min., 30.0% in 2 min, and 68.1% in 4 min. White perch eggs exposed to a shear level of 350 dynes per square cm were killed at a rate of 38% in 1 min., 41% in 2 min., 89% in 5 min., 96% in 10 min and 98% in 20 min. White perch larvae exposed to the same conditions were killed at a rate of 38% in 1 min., 52% in 2 min., and 75% in 4 min. Results are used in conjunction with the determination of shear levels in the Chesapeake and Delaware Canal and ship movement for the estimation of egg and larvae mortalities in the field. (Katz)

THE SMITH MOUNTAIN - LEESVILLE PROJECT: A CASE HISTORY,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
G. M. Simmons, Jr.
Transactions of American Fisheries Society, Vol. 105, No. 1, p. 1973-180, 1976. 5 fig., 1 tab., 22 ref.

Descriptors: *Thermal stratification, *Reservoirs, *Powerplants, *On-site investigations, *Primary productivity, *Water quality, *Pumped storage, *Reservoir operation, *Recirculated water, Water treatment, Water circulation, Impoundments, Standing crop, *Virginia, Recycling.
Identifiers: *Smith Mountain-Leesville Project(Va), Roanoke River(Va), Blackwater River(Va).

The Smith Mountain Pump Storage Project consists of two reservoirs in tandem on the Roanoke and Blackwater Rivers approximately 64 km southeast of Roanoke, Virginia. The reservoirs have provided sites for evaluating the impact of pump storage operation on primary productivity, fisheries, and water quality. Due to the location of the dam and the dendritic nature of the basin, the effect of recycling to alleviate detrimental water quality effects caused by thermal stratification were minimal. Moreover, as might be expected, the quality of water found in the upper reservoir depends upon the quality of water being recycled from the lower impoundment. Recycling appears to enhance primary productivity rates, at least in the vicinity of the dam. Pump storage operation does not appear to detract from the fishery in either reservoir. Although comprehensive studies are still needed in many areas, the results of all studies to date indicate a net beneficial effect of pump storage operation on environmental quality. (Katz)
W77-02715

TOXICITY OF WATER-SOLUBLE FRACTIONS OF FOUR TEST OILS FOR THE POLYCHAETOUS ANNELIDS, NEANTHES ARENACEODENTATA AND CAPITELLA CAPITATA,
Texas A and M Univ., College Station. Dept. of Biology.
S. S. Rossi, J. W. Anderson, and G. S. Ward.
Environmental Pollution, Vol. 10, p. 9-17, 1976. 2 fig., 2 tab., 12 ref

Descriptors: *Benthic fauna, *Benthos, *Oil wastes, *Mortality, *Toxins, Pollutants, *Toxicity, *Bioassay, *Annelids, *Bioindicators, *Lethal limit, Laboratory tests, Water pollution sources, Invertebrates, Worms, Environmental effects, Water pollution effects, *Pollutant identification.
Identifiers: *Neanthes sp., *Capitella sp., Polychaetes, Naphthalenes.

The toxicity of water-soluble fractions of two refined and two crude oils to two species of laboratory-reared polychaetes was determined. The two refined oils (No. 2 fuel oil and bunker 'C' residual oil) proved most toxic to both species. South Louisiana crude oil was less toxic than either of the refined oils, yet more toxic than Kuwait crude oil. The higher concentrations of toxic diaromatic compounds (naphthalenes) found in refined oils probably accounted for major differences between the toxicity of refined versus crude oils. Capitella capitata was slightly more sensitive to three of the four oils than was Neanthes arenaceodentata. Both species appear to be similar to fish and crustaceans in their sensitivity to these four oils. (Katz)

EDWARDSIELLA TARDA FROM EPIZOOTIC OF MULLETS (MUGIL CEPHALUS) IN OKITSU BAY, (IN JAPANESE),
Kochi Univ. (Japan). Dept. of Cultural Fisheries
R. Kusada, T. Toyoshima, Y. Jwamura, and H. Sako.
Bulletin of the Japanese Society of Scientific Fisheries, Vol. 42, No. 3, 1976, p. 271-276, 1 f 12 ref.

Descriptors: *Mortality, *Marine fish, *Mar fisheries, *Animal diseases, *Fish diseas Microbiology, Aquatic microbiology, Marine b teria, Microorganism, Fishkill, *Epizootiology.
Identifiers: *Mullets, Mugil cephalus, Jap *Okitsu Bay(Japan), *Edwardsiella tarda.

During the period from late September thro early October 1973, an epizootic occurred am mullet populations in a bay in Kochi Prefectu Dying fish displayed erratic swimming and a m or less whirling motion at the surface. Affec fish had large malodorous abscesses with hem hagic borders in the body surface. The etiolog agent was isolated from the kidney of disea mullets. These organisms were gram-nega motile peritrichously flagellated rods, not enc sulated, and measuring about 0.8 x 0.4 u. The b teria grew slowly on nutrient agar requiring 4 of incubation at 25C to form the typical small mm in diameter), circular, transparent, slig raised colonies. They gave negative oxidase r tion, positive catalase reaction, utilized gluc fermentatively and reduced nitrate to nitrite. T did not utilize citrate and malonate as a sole bon source. No actions on d-tartrate and muc were exhibited. The organisms were the proc tion of hydrogen sulfide in TSI agar and indol tryptone water positive to methyl red test, n tive to VP reaction, decarboxylation of lysine ornithine, and utilization of fructose, galact mannose and glycerol. They were sensitive streptomysin, kanamycin, chloramphenol, razolidon and nalidix acid. (Katz)

BIOSYNTHESIS OF ORGANIC ARSENIC CO POUNDS IN BROWN TROUT (SALMO TR TA),
Fisheries and Marine Service, St Jo (Newfoundland). Biological Station.
W. R. Penrose.
Journal of the Fisheries Research Board Canada, Vol. 32, p. 2385-2390, 1975. 2 fig., 3 t 15 ref.

Descriptors: *Traces, *Brown trout, *Ars compounds, *Fish physiology, *Path of p tants, *Metabolism, Arsenic radioisoto Laboratory tests, Methodology, Biochemis Organic compounds.
Identifiers: *Biosynthesis.

Radioactive, inorganic arsenic was administ to brown trout (Salmo trutta) orally and by tramuscular injection. The orally administere senic appeared in the tissues in an altered f that is presumed organic, this organoarsenical also found in the gastrointestinal contents. Th jected arsenic appeared in the tissues in inorg form and was only slowly converted to org form. Large amounts of inorganic and organ senic were detected in the bile. These findings consistent with biosynthesis of the organic ars compound within the gastrointestinal tract. (Ka W77-02719

AQUEOUS AMMONIA EQUILIBRIUM CAL LATIONS: EFFECTS OF PH AND TEMPE TURE,

UDIES ON THE CHEMICAL BEHAVIOR OF 6-RU IN SEA WATER AND ITS UPTAKE BY ARINE ORGANISMS -I, ACCUMULATION ND EXCRETION OF 106-RU BY CLAM,
ational Inst. of Radiological Sciences, akaminato (Japan). Marine Radio-Ecological search Station.
Ishikawa, T. Koyanagi, and M. Saiki.
lletin of the Japanese Society of Scientific sheries, Vol. 42(3), 1976, p. 287-297. 4 tab., 6 ., 9 ref.

escriptors: *Metals, *Path of pollutants, Inver-brates, Mollusks, *Water quality, Sea water, lams, Laboratory tests, *Physiology(Animal), ochemistry, *Absorption, *Radioactivity.
entifiers: *Ruthenium radioisotopes, 106-thenium, Meretrix, Biological half-life, Soft tis-es.

cumulation and excretion of 106-Ru by the m, Meretrix meretrix lusoria, were investigated relation to the chemical forms under laboratory ndition. A little difference in the biological up-ke was observed only when 106-Ru was epared to the chemical form of 106-RuNO.C1x. cumulation seemed to be attributable to the ecific surface area of tissues or the physiological tivities of organs of the clam. Reared for 100 ys, the edible part of the clam represented the lioactivity ratio of 4.9. In general, radioactivity s from the cam was relatively rapid for the emical form of prep'd 106-RuNO.C1x. After 40 ys, approximately 25% of accumulated prep'd 6-Ru was lost from the whole body of the living m. The lost radio-activity, especially in the ini-l experimental stage, was not due to the desorp-n from the shell but to the biological activities of t tissues of the clam. The biological half lives re also discussed in relation to the chemical ms. The loss curves obtained with the whole dy clam consisted of two components, whereas t with the soft tissues were classified into three mponents. (Katz)

E ECOLOGY OF AN ARTIFICIAL COOLING KE,
W. Harmsworth.
rhandlungen Internationale Vereigung fur orelische und ungiwandte Limnologie, Vol. 19, 2189-2200, November, 1975, 6 fig., 7 tab., 9 ref.

scriptors: *Temperature, Plankton, oplankton, *Electric powerplants, ytoplankton, *Benthos, *Cooling water, kes, *Artificial lakes, Water quality, On-site in-tigations, *Thermal water, Size, Powerplants, ecreation, Environmental effects, Aquatic pulations, Chlorinated hydrocarbon pesticides, ermal pollution, *Illinois.
ntifiers: *Lake Sangchris(Ill).

In an attempt to clarify the impact of thermal discharges from electric power utilities on aquatic ecosystems, a summary of studies undertaken by a private firm is presented. The history and development of Lake Sangchris in central Illinois as a closed cycle cooling lake is presented as well as the ecology, water chemistry, plankton, benthos and fishery resource. Phytoplankton and zooplankton present in Lake Sangchris were uniformly of small size and eutrophication was not apparent as might be expected from high nutrient levels and temperatures in the lake. The gizzard shad, a filter feeder, is possibly the cause of this situation. Benthic populations increased perhaps due to discontinued use of chlorinated pesticides by farmers. The fishery in Lake Sangchris consists of 18 species which includes native species as well as largemouth bass and channel catfish which were stocked. The lake is successfully used not only as a cooling system, but also for recreation. (Katz)
W77-02723

SOME ENVIRONMENTAL AND TOXICOLOGICAL ASPECTS OF TRI-ARYL PHOSPHATE SYNTHETIC OIL,
R. Wageman.
Verhandlungen Internationale Vereinigung fur Theoretische und ungewandle Limnologie, Vol 19, p 2178-2184, November, 1975. 3 fig, 3 tab, 6 ref.

Descriptors: Oil, *Toxicity, *Phosphates, *Water pollution effects, *Bioassay, *Rainbow trout, *Oil pollution, *Hydrolysis, Environmental effects, Oil spills, *Oil wastes, Laboratory tests, Chemical degradation, *Phosphorous compounds, Water pollution sources.
Identifiers: *Tri-aryl phosphate oil, *Synthetic oil.

A synthetic oil, tri-aryl phosphate, was examined, as a representative of synthetic oils used in industry, for its toxicity to fish and for its rate of hydrolysis in river water. A commercial synthetic tri-aryl phosphate oil with the brand name IMOL S-140 was used. A half-life of 96 days was obtained and the resulting production of phosphate was negligibly small. Toxicity tests with guppies showed that IMOL was not acutely toxic but long-term exposure of four months produced symptoms of chronic-poisoning in rainbow trout. Enlarged livers developed, internal tissue turned blue-gray and enzyme activities of LDH and GOT increased abnormally. (Katz)

CHLORINE-CONTAINING STABLE ORGANICS: NEW COMPOUNDS OF ENVIRONMENTAL CONCERN,
C. W. Gehrs, and R. L. Jolley.
Verhandlungen Internationale Vereinigungfur Theoretische und ungewandte Limnologie, Vol. 19, p. 2185-2188, November, 1975. 3 fig., 5 ref.

Descriptors: *Organic compounds, Resistance, *Chlorination, *Pesticide residues, *Lethal limit, *Food chains, *Food webs, Environmental effects, *Daphnia, *Bioassay, *Reproduction, *Mortality, Pollutants, Plankton, Aquatic life, Water purification, Chlorine, Water pollution sources.
Identifiers: *Sublethal effects, 4-chlororesorcinol, 5-chlorokuvacil.

Chlorine-containing stable organics are formed when chlorine is added to water containing high concentrations of organics. Maturation and survival of Daphnia magna were evaluated after exposure to several concentrations of two chlorine-containing stable organics. A dose-response relationship was found with all concentrations of 4-chlororesorcinol with increased concentrations causing a decrease in time to LC50. Survival was not affected by 5-chlorouracil at concentrations tested. Reproduction was inhibited by 4-chlororesorcinol and stimulated at lowest concentrations for 5-chlorouracil. (Katz)

Descriptors: *Enzymes, *Inhibitors, Biochemistry, *Kinetics, Water quality, *Heavy metals, *Mode of Action, Water pollution sources, *Respiration, Laboratory tests, Analytical techniques, Cations, Pesticides, Organic compounds, Toxins, Channel catfish, DDT, Mercury, Cadmium, Diazinon.
Identifiers: *Carbonic anhydrase, Sevin, Lindane.

Carbonic anhydrase (CA, carbonate hydro-lyase EC 4.2.1.1) from lysed red blood cells of the channel catfish (Ictalurus punctatus) was studied to determine physico-chemical kinetic properties and relative sensitivity to 56 chemicals of significance

in water quality research. In general, enzyme activity was strongly reduced by heavy metal inorganic cations; less strongly by organometallic cations, some anions, and certain pesticides; and weakly inhibited by light metal cations and organometallic and organic compounds. Dose-response curves were qualitatively similar in most cases. (Katz)

BIOACCUMULATION OF MERCURY IN MYOXOCEPHALUS QUADRICORNIS (L.) (TELEOSTEI, COTTIDAE) IN AN UNPOLLUTED AREA OF THE BALTIC,
Helsinki Univ. (Finland). Dept. of Environmental Science.
P. Nuorteva, and E. Hasanen.
Ann. Zool. Fennici, Vol. 12, p. 247-254, 1975, 1 fig., 4 tab., 48 ref.

Descriptors: *Mercury, *Path of pollutants, *Absorption, *Sculpins, Environmental effects, Habitats, *Food webs, Analytical techniques, Invertebrates, *Marine fish, Methodology, Size, Metabolism, Teleosts.
Identifiers: *Myoxocephalus quadricornis, *Bioaccumulation, Tissue analysis, *Baltic Sea(Bromarv area).

The mercury content of organisms in the unpolluted Bromarv area of the Baltic ranged from 0.03 ppm in invertebrates to 0.29 ppm in the flesh of piscivorous fishes to 2 ppm in the flesh of fish-eating migratory birds. The mercury content of the stenothermal fish, Myoxocephalus quadricornis increased with size to a maximum of 0.47 ppm. Observations from an area moderately polluted with mercury showed an accelerated accumulation of mercury. This indicates that the balanced natural condition of mercury circulation is characterized by regression coefficients near zero. The exceptionally stron bioaccumulation of mercury by M. quadricornis is probably a result of its feeding on mysids which have a higher mercury content than other invertebrates. (Katz)

BIOCHEMICAL EFFECTS OF METHYLMERCURIC CHLORIDE, CADMIUM CHLORIDE, AND LEAD NITRATE ON EMBRYOS AND ALEVINS OF THE BROOK TROUT, SALVELINUS FONTINALIS,
National Water Quality Lab., Duluth, Minn.
G. M. Christensen.
Toxicology and Applied Pharmacology, Vol. 32, 1975, p. 191-197, 2 tab., 18 ref.

Descriptors: *Mercury, Cadmium, Lead, Freshwater fish, Physiology, Bio-chemistry, *Brook trout, Growth rates, Growth stages, Proteins, Water pollution, *Water pollution effects, *Path of pollutants, *Toxicity, *Bioassays, Enzymes, Life cycles, *Chlorides, *Nitrates.
Identifiers: Biochemical responses, Salvelinus fontinalis, *Methylmercuric chloride, *Cadmium chloride, *Lead nitrate.

Brook trout (Salvelinus fontinalis) embryos and alevins were exposed to methylmercuric chloride (0.010-1.03 ppb of Hg), cadmium chloride (0.035-3.43 ppb of Cd), and lead nitrate (plumbous, 0.057-530 ppb of Pb) as a part of a study to evaluate biochemical responses to three important water pollutants during early stages of life. After exposures of 16-17 days for embryos and continuing to 21 days after hatching for alevins, biochemical analyses were carried out. The factors measured were weight, protein, glutamic oxaloacetic transaminase, alkaline phosphatase, acetylcholine esterase and adenosine-5'-triphosphate (ATP). A statistical evaluation ($p<0.05$) of the results from control and exposed specimens showed one change for embryos: a decrease in GOT activity in response to 1.03 ppb of CH3Hg(II). Thirteen changes were found for alevins: a decrease in weight in response to CH3Hg(II), Cd(II), and Pb(II); an increase in protein content in response to Cd(II); an increase in GOT activity in response to CH3Hg(II) and Cd(II); an increase in ALP activity in response to Cd(II) and Pb(II); and an increase in ACH activity in response to Cd(II) and Pb(II). THE EFFECTIVENESS OF THE FINNISH ANTI-MERCURY MEASUREMENTS IN THE MODERATELY POLLUTED AREA OF HAMEENKYRO, (IN FINNISH),
Helsinki Univ. (Finland). Dept. of Environmental Science.
P. Nourteva, E. Hasanen, and S. L. Nourteva.
Ymparisto ja Terveys, 1975, Vol. 6, No. 8, p. 611-635, 7 tab., 29 ref.

Descriptors: *Mercury, Metals, *Path of pollutants, Water pollution effects, *Public health, Freshwater fish, Water pollution control, Pathology, Biochemistry, Neutron activation analysis, *Human diseases, Human pathology, Insects, *Pulp wastes, Pulp and paper industry, *Heavy metals.
Identifiers: *Methylmercury, *Finland, Mercury transfer, Sarcophagous flies, Mercury half life.

The reduction of use of mercury slimicides in pulping operation in Finland has resulted in a decrease of tissue mercury content in fresh-water fish of about 0.2 ppm/year. Decrease in the mercury content of hair in the people who had stopped eating fish was observed. The mercury content of sarcosoprophagous flies reared in fish with different degrees of mercury contamination was observed. (Katz)

EFFECTS OF WATER QUALITY ON LARVAL SETTLEMENTS IN LOS ANGELES HARBOR AS DETERMINED BY MULTIVARIATE STATISTICAL TECHNIQUES,
University of Southern California, Los Angeles. Allan Hancock Foundation.
D. F. Soule, R. R. Emerson, J. D. Soule, R. W. Smith, and M. Oguri.
IEEE Ocean, p. 913-918, 1975. 3 tab., 3 fig., 11 ref.

Descriptors: *Dissolved oxygen, *Temperature, *Salinity, Water quality, *Larvae, *Turbidity, Hydrogen ion concentration, Analytical techniques, *Statistical methods, *Distribution, Environmental effects, Water pollution effects, On-site data collections, Monitoring, *California, Primary productivity, Distribution patterns, Spatial distribution, Larval growth stage.
Identifiers: *Los Angeles Harbor(Calif).

Settling racks placed at different locations in Los Angeles Harbor and representing a variety of water quality conditions were monitored for larval settlement over a two year period. Temperature, salinity, pH, dissolved oxygen, primary productivity, nitrates, nitrites, NH3 and sediment chemistry were determined. Multivariate statistical techniques were applied in order to define the major physical parameters affecting larval distribution and settlement. The major abiotic parameters which contribute to the environmental gradient within the study area were temperature and dissolved oxygen. Higher temperatures and lower dissolved oxygen levels within the inner harbor were modified with incoming seawater from the outer and outside harbor areas. Secondary factors include turbidity and salinity. (Katz)

PLANKTON PHOTOSYNTHESIS AND DEGRADATION IN THE KAPCHAGAI RESERVOIR IN THE THIRD YEAR OF ITS EXISTENCE, (IN RUSSIAN),
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Inst. of Microbiology and Virology.
N. K. Gulaya, and N. L. Tyuten'Kova.
Gidrobiol Zh 11(3), p 43-46, 1975.

Descriptors: *Plankton, *Photosynthesis, *Productivity, Degradation(Decomposition), Reservoirs, *Biodegradation decomposing organic matter.
Identifiers: Kapchagai reservoir(Kazakh-SSR, USSR.

Photosynthetic production and degradation of organic matter in the Kapchagai reservoir in the Alma-Ata district of the Kazakh SSR (USSR) have been determined regularly since it was first filled in 1970. The results of the 3rd survey, carried out in May, July and Oct. 1972, are given. In all seasons degradation exceeds plankton photosynthesis. In spring degradation is almost twice production. In summer degradation and production are about the same. In fall degradation exceeds production by a factor of 1.5.—Copyright 1976 Biological Abstracts, Inc.

A BENTHIC SURVEY OF FLAT CREEK AND THE SALT RIVER NEAR THAYNE, WYOMING,
Environmental Protection Agency, Denver, Colo. Technical Support Branch
Available from the National Technical Information Service, Springfield, VA 22161 as PB-245 80
Price codes: A02 in paper copy, A01 in microfich
Report No. SA/TSB-14, February 1973. 16 p. fig., 6 tab.

criptors: *Benthos, *Organic wastes, Rivers, ductivity, *Wyoming, Dissolved oxygen, age effluents, Mayflies, Caddisflies, ochaetes, Midges, Aquatic insects, *Farm es, Dairy industry.
tifiers: *Dairy wastes, Flat Creek(Wyo), Salt r(Wyo), Thayne(Wyo), Blackflies.

pling results showing the effects of dairy ge and whey discharges on stream benthic munities (Ephemeroptera, Tricoptera, Plecop- Hemiptera, Coleoptera, Diptera, ochaetes, and Annelida) are presented. The on immediately adjacent to the outfall was red with a thick layer of congealed whey for oximately 50 yards downstream, with a sig- ant reduction of all organisms--the result of mothering effect of the whey. At 300 yards nstream, large increases in the average ber of mayflies, blackflies, and midges were rved, due to the enrichment of the sewage on of the effluent, as evidenced by substantial ases in organic carbon, total nitrogen, and phorus. Two miles downstream from the arge, the quantity of mayflies, blackflies, and es was significantly higher than the upstream ol station. The only evident detrimental ef- of the effluent was the smothering by the con- d whey at the station closest to the discharge, no blanketing effect was observed at the nstream stations. The reduction of dissolved en from an average of 8.0 mg/l at the control n to an average of 5.7 mg/l at the second pling station did not produce gross detrimental ts on the benthic community. riptors: *Chemical properties, *Chesapeake *Bottom sediments, Estuaries, *Temporal bution, *Spatial distribution, Oxidation ction potential, Hydrogen ion concentration, rides, Alkalinity, Sulfates, Phosphates, Iron, onia, Silicates, Manganese, Cores, Bicar- tes.

analyses to calculate the chemical mass ce relations in estuaries based on spatial and oral variability of the concentrations of dis- d species in the sediment, and their interac- , are described. Data reliability is contingent navigational accuracy which limits relocation mple sites and variations in temperature, ty, and sediment deposition rates, which are ndent on time cycles, and which, in turn, in- ce both the biological and inorganic sses taking place within the cores. The oxida- eduction potential, hydrogen ion concentra- hloride, silicate, sulfate, carbonate alkalini- mmonia, phosphate, iron and manganese were lated and compared to the analytical iques. The spatial variations were only ly greater than the limits set by the analytical iques. However, groundwater infiltration can ly affect the interstitial water chemistry and be an important influence in some areas; also istribution of some chemical species is con- d by local mineral equilibria, which decreases producibility of spatial data. Temporal varia- greatly exceeded the limits of spatial varia- for each chemical specie. For parameters are conservative and/or influenced minantly by incrganic activity, seasonal es in salinity and temperature control the in- ial water profiles. Those species which are involved in the decomposition of organic matter also showed a gross seasonal correlation. (Auen-Wisconsin)

NITROGEN IN SEDIMENTED ORGANIC MATTER FROM LAKE ONTARIO,
Canada Centre for Inland Waters, Burlington (Ontario).
A. L. W. Kemp, and A. Mudrochova.
In: Proceedings of the International Meeting on Humic Substances, Nieuwersluis, Netherlands, 1972, p. 137-157. 9 fig., 10 tab., 47 ref.

Descriptors: *Nitrogen compounds, *Lake Ontario, *Lake sediments, Amino acids, Humic acids, Analysis, Fulvic acids, *Organic matter, *Nitrogen, Water pollution effects.

Preliminary results of an ongoing study to determine the nature of the nitrogenous fraction of sedimented organic matter from Lake Ontario indicated that the insoluble, combined amino acids account for 45% of the total nitrogen in the bottom sediments; combined amino sugars (10%), fixed ammonium nitrogen (6%) and exchangeable ammonium-N (2%) comprise the balance of the known nitrogen compounds, leaving about 36% of the nitrogen which cannot be identified. The sediment contained three times more fulvic than humic acids, both of which are extractable in dilute sodium hydroxide. The distribution of individual protein and non-protein amino acid residues in the humic and fulvic acids on a relative basis is similar to that found in the whole sediment, in algae, zooplankton, and bacteria. Furthermore the relative abundance of amino acid residues found in the sediments is close to that reported for several Canadian soil types, except for a rather high nitrogen content, which, it is theorized, is due to the relatively larger protein content of the lake's seston. Infra-red spectra suggested the presence of polypeptides as well as proteins and polysaccharides. The polypeptide nature of the sediment fulvic acids and combined soluble amino acids was also suggested by the release of free amino acids with a proteolytic enzyme. (Auen-Wisconsin)

THE EFFECT OF DISSOLVED ORGANIC MATTER IN SEA WATER ON THE UPTAKE OF MIXED INDIVIDUAL HYDROCARBONS AND NUMBER 2 FUEL OIL BY A MARINE FILTER-FEEDING BIVALVE (MERCENARIA MERCENARIA),
Rhode Island Univ., Kingston. Graduate School of Oceanography.
P. D. Boehm, and J. G. Quinn.
Estuarine and Coastal Marine Science, Vol. 4, No. 1, p. 93-105, 1976. 5 fig., 1 tab., 31 ref. R803415-01-0.

Descriptors: *Organic matter, *Sea water, *Oil, *Clams, *Absorption, Solubility, Aromatic compounds, Organic compounds, Dissolved solids.
Identifiers: *Dissolved organic matter, Number 2 fuel oil.

The presence of naturally-occuring dissolved organic matter (DOM) in sea water significantly inhibits the uptake by the clam (Mercenaria mercenaria) of certain saturated hydrocarbons. In laboratory studies, the bivalves were placed in test solutions consisting of seawater in which n-hexadecane, phenanthrene and No. 2 fuel oil were mixed. One test solution contained seawater which had been treated with activated charcoal to reduce the DOM content. Clams which had ingested the seawater with reduced DOM content underwent a statistically significant increase in hexadencane uptake, a 17-fold increase in the uptake of the 'saturated' fraction of the fuel oil and a 5-fold increase in the uptake of the 'aromatic' fraction. However, there was no variance in the test results in phenanthrene. Average uptake of the total fuel oil hydrocarbon was seven times greater for the bivalves in the reduced-DOM test. The results suggest that DOM in seawater solubilizes saturated hydrocarbons and makes them less readily taken up by the clams. (Harris-Wisconsin)

EFFECTS OF PASSAGE THROUGH POWER PLANT COOLING SYSTEMS ON ESTUARINE COPEPODS,
Maryland Univ., Solomons. Chesapeake Biological Lab.
D. R. Heinle.
Environmental Pollution, Vol. 11, No. 1, p. 39-58, 1976. 3 fig., 11 tab., 20 ref.

Descriptors: *Water pollution effects, *Powerplants, *Copepods, *Chesapeake Bay, Entrainment, Cooling water, Intakes, *Maryland, Chlorine, Heated water, Analytical techniques, Sampling.

The effects of chlorination, heated water, and entrainment on the copepods Scottolana canadensis, Eurytemora affinis and Acartia tonsa, at three power plant sites in Chesapeake Bay were measured by vital staining, a technique that allowed the examination of more individual organisms for viability or mortality. The Vienna plant (located at the Nanticoke River) with the greatest temperature rise, highest absolute temperatures, lowest salinities, and no chlorination, caused no detectable mortalities. At the Clark Point plant (located on the Patuxent River) there were slight mortalities with no chlorination and substantial mortalities occurred only during chlorination. At the Morgantown site (located in Maryland below the Route 301 bridge across the Potomac River estuary) significant mortalities occurred only when chlorine was used. In addition to the slight mortalities caused by temperature alone and the clear effects of chlorine, the data suggested a difference in sensitivity of the three species. In order of increasing sensitivity they are: S. canadensis, E affinis and A. tonsa. The statistical problems associated with precise estimates of numbers of organisms passing through the Morgantown plant are presumed to be due to inadequate sampling efforts and the lack of prior knowledge of the copepod distribution. (Auen-Wisconsin)

CHEMICAL AND PHOTOCHEMICAL TRANSFORMATION OF SELECTED PESTICIDES IN AQUATIC SYSTEMS,
Environmental Research Lab., Athens, Ga.

N. L. Wolfe, R. G. Zepp, G. L. Baughman, R. C. Fincher, and J. A. Gordon.
Report No. EPA-600/3-76-067, September 1976. 151 p. 58 fig., 29 tab., 206 ref. 1BA609.

Descriptors: *Chemical reactions, *Pesticides, *Herbicides, Hydrolysis, Oxidation, Reduction(Chemical), Chemical degradation, Agricultural runoff, Water quality control, Aquatic habitats, Aquatic environments.
Identifiers: *Photochemical reactions, *Photochemical transformation processes, *Malathion, *Carbaryl, *Methoxychlor, *Captan, *2,4-D esters, Photolysis, Direct photolysis, Sensitized photolysis, Photooxygenation.

Laboratory data are given to help assess the relative importance of various chemical and photochemical transformations for nine selected pesticides under conditions expected in aquatic ecosystems. Reaction processes studied include hydrolysis and oxidation-reduction among the chemical processes, and direct photolysis, sensitized photolysis and photooxygenation involving singlet oxygen among the photochemical processes. Measured rate constants, half-lives and other data are given for the transformation of malathion, carbaryl, methoxychlor, captan and 2,4-D esthers. Less-complete data are given for atrazine, diazinon, parathion and toxaphene. Transformation processes considered likely to be environmentally important in water, and calling for intensive further research, are chemical degradation for malathion, hydrolysis of 2,4-D esters in basic water and photolysis in acidic water, sensitized photolysis of methoxychlor in natural waters, sensitized photooxidation of captan in river water and hydrolysis of carbaryl in basic waters. Studies in greater detail are needed for sensitized photolysis of pollutants in natural waters, for delineation of sediment associated hydrolysis and for the role of oxidative processes in natural waters. TEMPORAL VARIATIONS IN THE PHOSPHORUS CONTENT OF A NORTHERN DYSTROPHIC LAKE,
Atomic Energy of Canada Ltd., Chalk River (Ontario). Chalk River Nuclear Labs.
J. W. McMahon, and A. E. Docherty.
Report No. AECL-5103, March 1975. 14 p. 4 fig., 1 tab., 14 ref.

Descriptors: *Phosphorus, Tracers, Streams, Lakes, *Canada, *Dystrophy, Thermocline, Epilimnion, Hypolimnion, Cycling nutrients, Temperature, Input-output analysis, Entrainment, Water pollution effects.
Identifiers: *Nutrient budget, Upper Bass Lake(Ontario), Chalk River(Ontario).

Concentrations of total and soluble phosphorus (TP,SP) entering and leaving a small dystrophic lake via streams, together with its subsequent distribution in the lake, were determined using radioisotope tracer techniques. Sampling was done during the summer stagnation period when temporal variations were thought to be in a 'pseudo-steady state' condition. Results indicate that both TP and SP concentrations increased with time at all depths, with more pronounced increases in the hypolimnion. Soluble and total phosphorus increased from 8.5 and 16 ug/l in surface waters in May to 17.0 and 35.0 ug/l by September, while the bottom meter of water showed an increase from 20 and 45 ug/l in May to 85 and 112 ug/l respectively in September. Between May and August, approximately 65% of the TP and 50% of the SP input via streams was retained by the lake. Total phosphorus increases of 1.4 kg in the epilimnion compartment and 2.5 kg in the hypolimnion were reported, while net stream input was estimated at 3.1 kg. It is suggested that this 25% difference of the estimated TP budget was primarily due to precipitation input, because of the close relationship between weekly precipitation values and the concentration of phosphorus entering the lake. A process of partial phosphorus entrainment was also observed. (Luedtke-Wisconsin)

PUBLIC INTEREST METHODS FOR SESSING CHEMICAL HAZARDS,
Center for Science in the Public Interest, Wash ton, D. C.
A. J. Fritsch
In: Papers of a Seminar on Early Warning Syst for Toxic Substances, held on January 30-Feb ry 1, 1974, at Battelle Research Center, Sea Washington (EPA-560/1-75-003, July 1975). p 201.

Descriptors: *Chemicals, *Public health, *Tox *Toxicity, *Social aspects, *Legal aspe *Legislation, Water pollution effects, Indus wastes, Air pollution, Hazards
Identifiers: *Public interest groups, Consu groups, Lobbyists, Community groups, Envi mental groups, Public participation.

A method is described by which coopera public interest groups may work for the detec and assessment of chemical hazards through of an intuitive-based and nonsystematic pre- system which relies heavily on cooperation an various public groups, accessibility of infor tion, credibility to the public and flexibility of proach. A public interest group with lim resources must rely on intuition to decide w potential hazards require their immediate eff and which ones can be left to later attention. N samples are submitted to independent laborato for analysis. Once the initial screening completed, intuitive-based subjective judgem is again applied to decide on the seriousness of suspected malady, the number of persons posed, anticipated increases in use of the stance, types of regulation required, and alte tives which can be easily substituted wit undue disruption to the national economy. If tion is decided upon, the public interest group then play the role of a lobbyist in government universities and the press. Examples in w prealert warning methods have been applie clude: asbestos, gasoline additives and aer sprays. (See also W77-02835) (Harris-Wiscons

CTERIAL DEGRADATION OF YCHLORINATED BIPHENYLS II. RATE DIES,
ada Centre for Inland Waters, Burlington ario).
. S. Wong, and K. L. E. Kaiser.
etin of Environmental Contamination and icology, Vol. 13, No. 2, p. 249-256, 1975. 3 fig., f.

criptors: *Microbial degradation, ychlorinated biphenyls, *Bacteria, Re- nce, Aroclors, Laboratory tests, Pseu- onas, *Biodegradation.
tifiers: Achromobacter, Aroclor 1221, clor 1242, Aroclor 1254.

chlorinated biphenyls (Aroclor 1221, 1242 and) at concentrations up to 0.1% in glucose did inhibit growth of lake water bacteria; there even a slight growth stimulation by Aroclor and 1242, as the bacteria used these com- nds as sole carbon and energy sources, but not clor 1254. Less than 1% of lake water bacteria, ever, possess this ability. Seven bacterial iso- from Aroclor agar plates were identified; five nged to Achromobacter sp. and two were domonas sp. The Aroclor 1221 mixture was pletely degraded into several low molecular ht compounds after one month incubation. the degradation studies of the PCB isomers e major components--biphenyl, 2-chloro-, and lorobiphenyl were condensed in separate col- rs. The test results indicated that the ability of eria to degrade 0.05% solutions of these com- nts were similar to the utilization of the clor 1221 mixture. Not only does chlorination ne biphenyl retard the bacterial degradation, the position of the chlorine atom in the ene ring is a determining factor for the adation rate of the two monochlorobiphenyls. also W75-02859) (Auen-Wisconsin)

WATER QUALITY EFFECT OF DIKING A SHALLOW ARID-REGION LAKE,
Brigham Young Univ., Provo, Utah.
D. K. Fuhriman, L. B. Merritt, J. S. Bradshaw, and J. R. Barton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-241 984, Price codes: A11 in paper copy, A01 in microfiche. Report EPA-660/2-75-007, April, 1975. 235 p, 7 fig, 9 tab, 28 ref, 2 append. EPA Program Element 1BB045. R-801400.

Descriptors: *Dikes, *Evaporation control, *Water conservation, *Reservoir evaporation, *Computer models, Water quality, Arid lands, Lakes, Inflow, Outflow, Utah, Methodology, Salts, Water resource development, Water management(Applied), Springs, Barriers, Diversion structures, Leaching.

Natural waters of arid regions contain great quantities of dissolved minerals, mainly because the watershed soils of streams in arid areas have not been subjected to the greater precipitation and natural leaching which has occurred for centuries in humid areas. These minerals remain as residue in storage reservoirs in increasingly greater concentrations. Most of the water 'used' is taken from the waters of basins by evaporative processes (evaporation loss) and serves no immediate beneficial purpose. Studies conducted to find means of reducing evaporative loss have concentrated on application of a protective material on water surfaces. This study was concerned with reducing the surface area of Utah Lake by diking off two bays and reducing the surface area by one-third. A computer model was used to determine the changes in lake water volume and salt concentrations. The diking of Utah Lake will result in salvaging water and improving water quality. The computer simulation model developed as part of this project may be used to predict water quality improvements and quantity savings which may result from diking of lakes at any location. OBSERVATIONS OF THE DAILY DYNAMICS OF PRIMARY PRODUCTION OF PHYTOPLANKTON, (IN RUSSIAN),
Kishinev State Univ. (USSR).
V. M. Shalar', and A. A. Untura.
Gidrobiol Zh 11(3), p 46-48, 1975.

Descriptors: *Primary productivity, Productivity, *Phytoplankton, *Photosynthesis, Plankton, Bodies of water, Scenedesmus.
Identifiers: Ankistrodesmus angustus, Ankistrodesmus spp, Bottle techniques, Cyclotella spp, Scenedesmus quadricauda, Strephanodiscus spp, Kuchurgan liman, Moldavian SSR, USSR.

Observations on the daily dynamics of phytoplankton photosynthesis were carried out simultaneously with a determination of the peimary production of the Kuchurgan liman (Moldavian SSR) and certain adjacent water bodies with 24-h exposure of the bottles. The determination of primary production by the light and dark bottle technique with 24-h exposure yielded understated results, especially in water with abundant phytoplankton. Since during the day the process of photosynthesis occurs with a different intensity, for a correct determination of primary production with high phytoplankton concentrations the bottles should be exposed for 1-2h and the values obtained during 24h summed. Data are given for Cyclotella spp., Ankistrodesmus spp., Stephenodiscus spp., Scenedesmus quadricauda and A. Angustus.--Copyright 1976, Biological Abstracts, Inc.

1976 ENVIRONMENTAL CONDITIONS RELATIVE TO SHRIMP PRODUCTION IN COASTAL LOUISIANA,
Louisiana Wildlife and Fisheries Commission, New Orleans. Div. of Oysters, Water Bottoms and Seafoods.
B. B. Barrett, and E. J. Ralph.
Technical Bulletin No. 21, July 1976, 20 p, 13 fig, 4 tab, 8 ref.

Descriptors: *Environmental effects, *Temperature, *Salinity, *Rainfall, Rivers, Shrimp, Commercial shellfish, Commercial fishing, Harvesting, Estuarine environment, Estuaries, *Louisiana.

Relationships between shrimp harvest and river discharge, rainfall, salinity, water temperature and the available amount of nursery area are discussed. The environmental data is presented through April 1976 and indicates favorable condition for a good brown shrimp harvest. Water temperatures have been mild and rainfall and river discharge have been unusually low causing higher than average salinities. Salinities of 10 ppt and above have provided over 2 million acres of nursery area (the largest amount of April nursery area since 1967). (Chilton-ORNL)
W77-02876

AN INVENTORY AND STUDY OF THE LAKE PONTCHARTRAIN-LAKE MAUREPAS ESTUARINE COMPLEX,
Louisiana Wildlife and Fisheries Commission, New Orleans, Div of Oysters, Water Bottoms and Seafoods.
J. W. Tarver, L. B. Savoie, and B. B. Barrett.
Technical Bulletin No. 19, January 1976, 159 p, 24 fig, 56 tab, 5 append, 55 ref.

Descriptors: *Ecology, *Limnology, Biology, Hydrology, Water chemistry, Sedimentology, Aquatic life, Wildlife, Vertebrates, Invertebrates, Plankton, Mollusks, Management, *Louisiana, Estuaries, *Estuarine environment.
Identifiers: *Lake Pontchartrain, *Lake Maurepas(La).

The purpose of the study was to investigate the composition, general distribution, and abundance of fauna inhabiting the Lake Pontchartrain-Lake Maurepas estuarine complex in order to enable administrators to efficiently manage Louisiana's renewable coastal zone resources. Included in the report are sections concerned with area description, biology, hydrology and water chemistry, and sedimentology. The biology section lists data on vertebrates and invertebrates collected in trawl and seine samples, zooplankton distribution and abundance, and mollusks collected in Peterson samples. Temperature, salinity, water chemistry, and dissolved and suspended solids are given detailed attention in the section on hydrology and water chemistry. The water bottoms of the two

lakes were found to be sediments of finer grain size than most other coastal water areas in Louisiana. This was believed to be due to the deposition of large quantities of similar sized particles by the floodwaters of 1973. (Chilton-ORNL)
W77-02879

EMBRYONIC DEVELOPMENT, EARLY GROWTH, AND MERISTIC VARIATION IN RAINBOW TROUT (SALMO GAIRDNERI) EXPOSED TO COMBINATIONS OF LIGHT INTENSITY AND TEMPERATURE,
Ontario Ministry of Natural Resources, Sault Ste. Marie. Fish and Wildlife Research Branch.
W. Kwain.
Journal of the Fisheries Research Board of Canada, Vol. 32, No. 3, 1975, p 397-402, 3 fig, 1 tab, 16 ref.

Descriptors: *Environmental effects, *Temperature, *Light, Fish, *Embryonic growth stage, Growth rates, *Rainbow trout, Reproduction.
Identifiers: *Meristic variations.

Optimum conditions for embryonic development of rainbow trout was found to be between 7 and 10 C and at 0.2 and 20 lx. Deviation from these conditions resulted in high mortality. Embryos were found to be tolerant of temperatures between 3 and 15 C and light intensities less than 400 lx. The study demonstrated that effect of light intensity and temperature on embryonic development is additive, and that light intensity and temperature can act singly and independently of the level of other factors. Differences in growth rates were studied at 10 and 3 C and at light intensities of 20, 2, and 0.2 lx. The higher temperatures always coincided with the higher growth rate. Fish grew slower at low light intensities than those at higher light intensities. Meristic variations were positively correlated with the embryonic development rate. (Chilton-ORNL)

RECENT PROGRESS ON THE CONTROL OF OVARIAN DEVELOPMENT AND INDUCED SPAWNING OF THE GREY MULLET (MUGIL CEPHALUS L.),
Oceanic Inst., Waimanalo, Hawaii.
C. M. Kuo, and C. E. Nash.
Aquaculture, Vol. 5, 1975, p 19-29, 5 fig, 3 tab, 13 ref.

Descriptors: *Environmental effects, *Temperature, *Light, Fish reproduction, Spawning, Photoperiodism, *Mullets.
Identifiers: *Gonadotropins, Grey mullets.

The induction of ovarian maturation out of season by manipulation of photoperiod and temperature cycle is reported. The factor of photoperiod initiated vitello-genesis of ovarian oocytes with a photoperiod of 6L/18D effectively triggering the ovarian development out of season. Best results for grey mullet occurred under constant temperature control of 21C. Fish held at a temperature range of 17-21C were induced to spawn by injections of purified salmon pituitary gonadotropin and larvae were raised through metamorphosis. (Chilton-ORNL)
W77-02882

ROLE OF STOCK BIOMASS AND TEMPERATURE IN RECRUITMENT OF SOUTHERN GULF OF ST. LAWRENCE ATLANTIC COD, GADUS MORHUA,
Fisheries and Marine Service, St. Andrews (New Brunswick). Biological Station.
P. F. Lett, A. C. Kohler, and D. N. Fitzgerald.
Journal of the Fisheries Research Board of Canada, Vol. 32, No. 9, 1975, p 1613-1627, 9 fig, 67 ref.

Descriptors: *Environmental effects, *Reproduction, *Eggs, Biomass, *Gulf of St. Lawrence, Temperature, Population, *Canada.
Identifiers: Recruitment, *Atlantic cod, Gadus morhua.

The stock recruitment mechanism for Gulf of St. Lawrence cod is reported to be primarily dependent upon the population biomass with the effects of temperature being of secondary importance. Density-dependent growth and fecundity act simultaneously in providing a coarse population regulatory mechanism. The fine tuning of the system is the reliance of demersal juvenile abundance on coincident population biomass and related numbers of larvae. It was concluded that there can be no clear relationship between parent stock biomass and subsequent recruitment in a two-dimensional Cartesian system. (Chilton-ORNL)
W77-02883

BARATARIA BASIN: SALINITY CHANGES AND OYSTER DISTRIBUTION,
Louisiana State Univ., Baton Rouge. Center for Wetland Resources.
V. R. Van Sickle, B. B. Barrett, L. J. Gulick, and T. B. Ford
WLFC Technical Bulletin No. 20, Sea Grant Publication No. LSU-T-76-002, May, 1976. 22 p, 8 fig, 3 tab, 58 ref, append

Descriptors: *Environmental effects, *Salinity, *Oysters, Commercial shellfish, Shellfish farming, Temperature, Water pollution, Population, Productivity, *Louisiana, Distribution.
Identifiers: *Barataria Basin(La).

Environmental factors affecting oyster population and the history of oyster production in the Barataria Basin, are discussed. Data shows that distribution of oysters is directly related to salinity and that mortalities resulting from predation and disease are often associated with increased levels of both salinity and temperature. Comparison of data accumulated over the past 20 years shows a trend towards increased levels of salinity in the Barataria estuary with a resulting northward movement of oyster producing areas. Problems arising from encroaching pollution levels from the north pose a real threat to oyster production in the Barataria Basin. (Chilton-ORNL)

EXPERIMENTAL SUBSTANTIATION OF THE MAXIMUM ALLOWABLE CONCENTRATION OF DIMIDE IN WATER BODIES, (IN RUSSIAN),
Academy of Medicine, Sofia (Bulgaria). Center for Hygiene.
S. Novakova, and S. Dinoeva.
Gig Sanit 12, p 75-78, 1975.

Descriptors: *Herbicides, *Organoleptic properties, Odor, Taste, Biochemical oxygen demand, Toxicity, *Lethal limit, Water quality standards, Rodents.
Identifiers: *Dimide, Diphenamid.

The herbicide dimide (diphenamid) affects the organoleptic properties (odor and taste) of water. Its threshold concentration with respect to taste is 6 mg/l and with respect to odor 8 mg/l. Dimide in a concentration up to 48 mg/l does not inhibit biochemical O2 demand processes. A dimide concentration of 4 mg/kg (80 mg/l) was inactive for warm-blood animals (rats) under conditions of a chronic sanitary-toxicological experiment. A concentration of dimide of 6 mg/l is proposed as the maximum allowable in water bodies.--Copyright 1976, Biological Abstracts, Inc.

Identifiers: Ancylus-fluviatilis, Asellus-aquaticus, Asellus-coxalis, Gammarus-pulex, Herpobdella-octoculata, Hydropsyche-angustipennis, Hydropsyche-sp, Rhyacophila-nubila, *Saale River(E. Germany).

Quantitative studies on the macrobenthos of the Saale River at 6 localities between Eichicht and Grossheringen (East Germany) made from Feb.-Oct. 1971 and from March-Aug. 1972. Chironomidae predominated everywhere and Gammarus pulex was abundant between Eichicht and Fischersdorf; Herpodella octoculata, Asellus and Hydropsyche angustipennis were dominant in the lower, more polluted sections. Rheophilic insects were commonly only at Fischersdorf. Pollution with sewage reduced the number of species. The biomass was lowest in late winter and early spring and highest in mid-summer. The important productive species were G. pulex at Eichicht, G. pulex, Rhyacophila nubila and Hydropsyche sp. at Fischersdorf and H. octoculata, Asellus aquaticus, A. coxalis and H. angustipennis from Rotherstein to Grossherigen. Ancylus fluviatilis was also important at Maua.--Copyright 1976, Biological Abstracts, Inc.

THE GROUNDWATER FAUNA OF THE SAALE RIVER DRAINAGE AREA (THURINGIA), (IN GERMAN),
Zentralinstitut fuer Mikrobiologie und Experimentelle Therapie, Jena (East Germany).
D. Ronneberger.
Limnologica 9(3), p 323-419, 1975.

Descriptors: Rivers, Surveys, *Drainage basins, Aquatic animals, *Distribution, Data collections, Europe, Water pollution effects, Groundwater, Diptera, Ecology.
Identifiers: Acarina, Amphipoda, Aranea, Archi-annelida, Candona-Eremita, Candonna-Hertzogi, Chilopoda, Cladocera, Coleoptera, Cyclopoida, Diplopoda, Gastropoda, Harpacticoida, Hydrozoa, Hymenoptera, Isopoda, Nematoda, Oligochaeta, Ostracoda, Pelecypoda, Pleistocene, Pseudoscorpiones, Rotatoria, Syncarida, Thuringia, Thysanoptera, Turbellaria, *Saale River(E. Germany).

A survey of the groundwater fauna of the Saale river drainage of Thuringia, East Germany yielded 2 spp. of Hydrozoa, 5 spp. of Turbellaria, 4 spp. of Rotatoria, 32 spp. of Nematoda, 1 sp. of Archiannelida, 2 spp. of Oligochaeta, 2 spp. of Cladocera, 12 spp. of Ostracoda, 14 spp. of Cyclopoida, 20 spp. of Harpacticoida, 2 spp. of Syncarida, 6 spp. of Amphipoda, 2 spp. of Isopoda, 15 spp. of Acarina, 1 sp. Pelecypoda, 3 spp. of Gastropoda, 1 sp. of Chilopoda, 2 spp. of Diplopoda, 1 sp. of Thysanoptera, 6 spp. of Coleoptera, 3 spp. of Hymenoptera, 1 sp. of Diptera, 1 sp. of Pseudoscorpiones and 5 spp. of Araneae. Candona eremita and C. hertzogi are new for East and West Germany. Localities, distributional data, bibliographic citations and accompanying species are given. Geological, geographical and hydrological data are included for the Orla, Schwarza and Roda river areas studied and the important stygophilic, stygobiontic and stygoxenic species are geographically and geographically discussed. The sections of the stream could not be clearly distinguished on the basis of ecological characteristics. The age and origin of the recent subterranean fauna are discussed. Terminology is proposed for a fragmented ecosystem (dialeimmal). The present distribution of the stygobiontic species is explained with reference to the Pleistocene river systems of Europe and the effects of the ice age. Possibilities for evaluating aquatic fauna by analyzing the subterranean organisms are also discussed. It is also possible to evaluate the effects and severity of pollution on the basis of the stygobiontic, stygophilic and stygoxenic species found.--Copyright 1976, Biological Abstracts, Inc.

DISTRIBUTION OF AMPHIPODA IN THE DNIESTER ESTUARY AND ITS POSSIBLE CHANGES IN CONNECTION WITH THE REGULATION OF THE DNIESTER RIVER, (IN RUSSIAN),
Institute of Biology of the Southern Seas, Sevastopol (USSR).
I. I. Greze, A. G. Krastskaya, and Z. A. Ponomareva.
Zool Zh 54(11), p 1723-1726, 1975.

Descriptors: Biomass, *Distribution, Estuaries, Salinity, Regulation, Seasonal, Water pollution, Rivers.
Identifiers: *Amphipods, Biomass, Corophiidae, *Dniester estuary(USSR), Gammaridae, Gmelina-kusnetzowi, USSR.

Amphipods in the Dniester estuary (USSR) are represented by Gammaridae (23 spp.) and Corophiidae (7 spp.). Gmelina kusnetzowi (Sow.) is recorded for the 1st time in the estuary. The occurrence of gammarids in different regions of the estuary characterized by different salinity changes from 17-51% and that of corophiids from 40-90%. In the norther and middle regions where the salinity changes only slightly and does not exceed 3.4%, the Caspian amphipods predominate. Seasonal dynamics is characterized by increased population density and biomass during spring-summer and a decrease during autumn-winter. Salinization of the estuarine waters due to the hydroconstruction may result in changes in composition and distribution of amphipods.--Copyright 1976, Biological Abstracts, Inc.

PRIMARY PRODUCTION AND OXYGEN BUDGET IN A STREAM OF THE CENTRAL PYRENEES, (IN FRENCH),
Toulouse-3 Univ. (France). Laboratoire d'Hydrobiology.
J. Capblancq, and P. Lavandier.
Ann Limnol 11(2), p 189-201, 1975.

Descriptors: *Primary productivity, *Dissolved oxygen, *Organic matter, Metabolism, Streams, Degradation(Decomposition), Decomposing organic matter, Water pollution, Shrubs, Ecosystems.
Identifiers: *France(Pyrenees streams).

Comparisons of changes in the dissolved O2 concentration between upstream and downstream stations was used to estimate primary production in a small stream at a mean altitude in the Pyrenees (France). Decomposition processes greatly exceeded gross primary production. The reduction in illumination by the shrubs on the bank, the large input of organic material at the time of the autumnal fall of leaves, and the progressive silting coupled with the absence of floods appeared to be the chief factors responsible for the metabolism of this ecosystem. In spite of some limiting factors (low variations is dissolved O2, strong diffusion, short retention time, input through drainage), the upstream-downstream comparative method can provide some valid estimates of production. The principal causes of error are analyzed.--Copyright 1976, Biological Abstracts, Inc.

ON THE LIVING ENVIRONMENT FOR FISH IN THE COASTAL WATERS SURROUNDING THE NEW AND OLD VOLCANIC ISLAND 'NISI-NO-SIMA', (IN JAPANESE),
Tokyo Univ. of Fisheries (Japan). Lab. of Research and Training Vessel Shinyo-maru.
T. Kido.
J Tokyo Univ Fish 61(1/2), p 59-63, 1975.

Descriptors: Surveys, *Water pollution effects, Coasts, Islands, *Fish, *Fish habitats, Environment, Asia.
Identifiers: *Japan, Nisi-No-Sima, *Volcanic ash.

In March, 1974 observations were carried out as a part of the survey of the volcanic island 'Nisi-no-Sima' to determine the effect of the eruption of a new volcano 'Nisi-no-Sima-Sin To' on fish in the coastal waters of the islands (Japan). Numerous fishes were caught by angling in the water off the W coast of the old island where the clean ocean water lapped the shore directly. Very few were caught on the E coast of the new island where the water contained volcanic materials ejected from the new volcano. The habitat for fish in the coastal region has been destroyed directly as well as indirectly by the eruption of the new volcano, though the damaged area may be small.--Copyright 1976, Biological Abstracts, Inc.

Descriptors: *Water pollution effects, *Crustaceans, *Oil spill, *Intertidal areas, Littoral, *Temperature, *California, *Marine animals, Benthic fauna, Benthic flora, Mollusks, Laboratory investigation, *On-site observations.
Identifiers: Southern California. *Santa Barbara, *Santa Barbara Crude oil, *Barnacles, *Chthamalus fissus, *Barnacle larvae, *Black body effect.

Experiments were conducted in the field and laboratory in Southern California to determine the effects of heavy black asphaltic Santa Barbara crude oil on the intertidal barnacle Chthamalus fissus. Observations were also made on surfaces in the Santa Barbara Channel oiled following the 1969 Santa Barbara oil spill. The data presented support the original hypothesis that this type of oil acts as a black body. It is this 'black body' effect which has a long term influence on Chthamalus fissus distribution after the oil has developed a hard surface crust. This is based on the following observations: (1) larvae can settle, survive, and grow on the dry oil (tar) (2) larvae prefer a black surface to a light surface (3) temperature stresses are greater on a black surface than on a light surface (Katz)

BIOTRANSFORMATION AND CHEMICAL FORM OF MERCURY IN PLANTS,
Environmental Montoring and Support Lab., Las Vegas, Nev.
D. D. Gay
Ecological Research Series, Report EPA-600/3-76-082, July 1976, 9 p, 3 fig, 29 ref.

Descriptors: *Mercury, *Plant physiology, *Plant tissues, *Metals, *Water pollution effects, Biochemistry, Absorption, *Environmental effects, Trace elements, *Legumes, *Public health, Enzymes.
Identifiers: *Plant biochemistry, *Methylmercury, *Mercurial transformation, Biotransformation, *Phenylmercury, *Pisum sativum, Peas.

The in vitro methylation of inorganic mercury has been demonstrated using an acetone precipitated protein fraction from Pisum sativum and S-adenosylmethionine as the methyl-donating compound. A time course of the enzymatic formation of methylmercury has shown that the maximum methylmercury concentration occurred after 1 hour of incubation of the substrates with the enzyme system. At all subsequent incubation times reduced concentrations of methylmercury in the reaction mixture were observed. When a time course for the in vivo methylation of inorganic mercury was done using an infiltration and incubation procedure, the maximum concentration of methylmercury was observed after 10 hours of incubation. All subsequent incubation periods produced lesser amounts of methylmercury. The results suggest that the methylmercury is an intermediate compound in the mercury pathway in peas (Pisum sativum). (Katz)

IMPACTS OF CONSTRUCTION ACTIVITIES IN WETLANDS OF THE UNITED STATES,
Tereco Corp., College Station, Tex.
R. M. Darnell, W. E. Pequegnat, B. M. James, F. J. Benson, and R. A. Defenbaugh.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-256 674. Price codes: A19 in paper copy, A01 in microfiche. Environmental Protection Agency, Ecological Research Series, Report EPA 600/3-76-045, April 1976. 392 p, 7 tab, 6 fig, 1023 ref.

Descriptors: *Wetlands, *Marshes, *Freshwater marshes, *Coastal marshes, *Tidal marshes, *Swamps, Aquatic environment, *Aquatic habitats, *Land reclamation, Soils, *Soil-water-plant relationships, *Wildlife, Aquatic plants, Aquatic animals, Streams, Estuaries, Continental shelf, Bibliographies, Reviews, Water quality, *Construction.

The primary types of construction activity which severely impact wetland environments of the United States include: floodplain surfacing and drainage, mining, impoundment, canalization, dredging and channelization, and bank and shoreline construction. Each type of construction activity is attended by an identifiable suite of physical and chemical alterations of the wetland environment which may extend for many miles from the site of construction and may persist for many years. In turn, each type of physical and chemical modification has been shown to induce a derived set of biological effects, many of which are predictable, in general, if not in specific detail. The most environmentally damaging effects of construction activities in wetland areas, in order of importance, are: direct habitat loss, addition of suspended solids and modification of water levels and flow regimes. Major construction-related im-

acts also derive from altered water temperature, pH, nutrient levels, oxygen, carbon dioxide, hydrogen sulfide, and certain pollutants such as heavy metals, radioactive isotopes, and pesticides. (Katz)

THE BIOLOGY AND CHEMISTRY OF A WARM-WATER STREAM,
Michigan State Univ., East Lansing. Dept. of Fisheries and Wildlife.
M. L. Brehmer, R. C. Ball, and N. R. Kevern.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-242 112, Price codes: A04 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University, Technical Report No. MSU-IWR-TR-8-003, Red Cedar River Series, December 1968. 0 p, 8 tab, 3 fig, 23 ref.

Descriptors: *Michigan, *Water pollution sources, Streams, *Urban drainage, Drainage area, Surface waters, Sediments, *Sewage, Sewage disposal, Urbanization, Erosion, *Ammonia, Ammonium compounds, Aquatic animals, Aquatic insects, *Benthic fauna, *Dissolved oxygen, Water pollution effects, Nutrients.
Identifiers: *Red Cedar River(Mich), Lansing(Mich).

The Red Cedar River, once a productive smallmouth bass stream, is located within the recreational area of metropolitan Lansing. The aesthetic and recreational value of this stream has been reduced as the result of urbanization and increased agricultural use, with the resulting fast runoff, erosion, and siltation, and by the introduction of domestic and industrial pollution. This study is concerned with the effects of nutrient inputs on the ecology of the stream and presents data vital to the reclamation processes. Specific emphasis is given to the ammonia nitrogen content and the dissolved oxygen content of the water, and the families of benthic forms present in the stream. Early observations seem to indicate that stream fertilization resulting from nutrient input released by the decomposition and mineralization of the organic material in the domestic sewage increased the complexity of the standing crop of the area. (Katz)

RESULTS FROM AQUATIC ECOLOGICAL SURVEYS AT NEWPORT ARMY AMMUNITION PLANT, NEWPORT, INDIANA,
Edgewood Arsenal, Aberdeen Proving Ground, Md.
J. S. Bender, and J. G. Pearson.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-016 977, Price codes: A03 in paper copy, A01 in microfiche. Technical Report, EB-TR-75044, October, 1975. 39 p, 12 tab, 4 fig, 17 ref.

Descriptors: *Methodology, *Benthos, *Water quality, *Invertebrates, Aquatic animals, Aquatic environment, Industrial wastes, Streams, Productivity, Degradation(Stream), Flow rates, Water pollution treatment, *Water pollution effects, Natural streams, Sewage sludge, Water pollution sources, On-site-investigations, *Indiana.
Identifiers: Monitoring, *Aquatic ecological survey, Wabash River(Ind), Munitions manufacturing, *Munitions wastes, *Trinitrotoluene(TNT).

Aquatic ecological surveys were conducted at Newport Army Ammunition Plant (NAAP) from February through June 1973 to determine the effects of TNT manufacturing and other plant operations on the water quality and stream biota of the drainages surrounding NAAP. Macroinvertebrates and stream water quality were sampled monthly, and fishes quarterly. Fishes collected were typical for streams in the area. Diversity and abundance of macroinvertebrates were affected more by natural fluctuations in the flow and runoff than by discharges or accidental spill from the TNT facility. Little Vermillion Creek received TNT wastes several times during the study, from accidental spills; however, no effect on species diversity or occurrence was detected. Little Raccoon Creek was biologically degraded by remnant sewage sludges and boiler blowdown; however, it had significantly recovered before it left the plant area. The discharge from the TNT plant entered the Wabash River after combining with the domestic sewage discharge. It was distinquishable from the river water by its color and high sulfate and conductivity values. There was insufficient biological data from the Wabash River to determine any effects from the TNT discharge. (Katz)
W77-03015

TOXAPHENE EFFECTS ON REPRODUCTION, GROWTH, AND MORTALITY OF BROOK TROUT,
Fish and Wildlife Service, Columbia, Mo. Fish-Pesticide Research Lab.
F. L. Mayer, Jr., P. M. Mehrle, Jr., and W. P. Dwyer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-249 303, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency, Ecologic Research Series, Report EPA 600/3-75-013, November 1975. 42 p., 15 tab., 2 fig., 69 ref.

Descriptors: *Brook trout, *Toxicity, Laboratory analysis, *Insecticide, *Chlorinated hydrocarbon pesticides, Pesticides, *Water pollution effects, Water pollution sources, *Growth rate, Environmental effects, *Mortality, *Bioassay, *Laboratory animals, Pathology, Fish fry, *Salmonids, *Reproduction.
Identifiers: *Toxaphene, *Continuous flow bioassay, Flow-through dilution system, *Collagens, *Chronic effects, Residue dynamics.

Yearling brook trout (Salvelinus fontinalis) were continuously exposed to toxaphene (0, 39, 68, 139, 288 and 502 ng/l) in a flow-through diluter system. Day length and water temperature were altered monthly to correspond to natural conditions. Adult growth was reduced in the 288 and 502 ng/l toxaphene exposures, and the added stress of spawning activities caused extensive mortalities in these concentrations. The numbers of eggs spawned and percent viability were inversely related to increasing toxaphene concentrations. All groups of fry exposed to toxaphene had reduced rates of growth and survival. Biochemical investigations on fry backbones demonstrated that bone collagen may be a sensitive indicator of normal and abnormal growth and development prior to being observed in the whole fish. Toxaphene was accumulated by brook trout 5,000 to 76,000 times that in the water and the more chlorinated isomers of toxaphene were preferentially stored. (Katz)
W77-03017

METHYL MERCURY AND THE METABOLIC RESPONSES OF BRAIN TISSUE,
Health Effects Research Lab., Cincinnati, Ohio.
R. J. Bull.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-252 006, Price codes: A03 in paper copy, A01 in microfiche. Environmental Health Effects Research Series, Report EPA 600/1-76-013, March 1976, 23 p., 7 fig., 30 ref.

Descriptors: *Mercury, *Public health, *Water pollution effects, Biochemistry(Animal), *Animal pathology, *Animal physiology, *Toxicity, Growth rates, *Metabolism, Potable water, Laboratory observations.
Identifiers: *Mercury organic compounds, *Methyl mercury, Cerebral cortex, *Brain energy metabolism.

Weanling, Sprague-Dawley rats have been exposed to methyl mercuric chloride (concentrations from 0.01 to 10.0 mg/liter) in their drinking water. At 10 mg/liter the animals exhibited neurological symptoms typical of methyl mercury. Also, in this group a considerable decrease in growth occurred which was associated with a decreased consumption of food. Responses of the respiratory intermediates to stimulation were found to be altered in cerebral cortex slices taken from exposed animals. Effects on tissue pyridine nucleotides predominated. An enhancement of the rats of pyridine nucleotide reduction by electrical stimulation was observed at 0.1 mg/liter. This rate progressively decreased at higher dose levels. Reoxidation of reduced pyridine nucleotide was also inhibited at 0.1 mg/liter at both 90 and 180 days of exposure. Potassium stimulated aerobic glycolysis was found to be enhanced in its initial stages at 0.10 mg/liter of methyl mercuric chloride in the drinking water but progressively declined at 1.0 and 10 mg/liter. A close parallel was observed between the time constant of pyridine nucleotide oxidation following electrical stimulation and the 'responsiveness' of the aerobic glycolytic rate to stimulation by potassium. These results suggest an initial defect in the oxidation of cytoplasmic NADH which progresses to loss of metabolic control of cytoplasmic oxidations. (Katz)
W77-03018

RESPONSE OF TWO ARCTIC AMPHIPODS, GAMMARUS ZADDACHI AND BOECKOSIMUS (ONISIMUS) AFFINIS TO VARIATIONS IN TEMPERATURE AND SALINITY,
Louisville Univ., Ky. Dept. of Biology.
M. Busdosh, and R. M. Atlas.
Journal of the Fisheries Research Board of Canada, Vol. 32, p. 2564-2568, 1975, 3 tab., 2 fig., 15 ref.

Descriptors: *Temperature, *Salinity, *Amphipoda, *Arctic, *Resistance, *Respiration, *Animal physiology, *Environmental effects, *Mortality, Laboratory tests, Crustaceans, Invertebrates, Cold regions.
Identifiers: *Gammarus zaddachi, *Boeckosimus(Onisimus) affinis.

Two arctic amphipod were found to be capable of tolerating a wide range of temperatures and salinities. They were tolerant to both abrupt changes, as would occur in crossing a thermocline, and to gradual changes, as would occur seasonally. Gammarus zaddachi could survive lower salinities and higher temperatures than Boeckosimus (Onisimus) affinis. Salinity had a statistically significant effect on rates of respiration rate in response to temperature changes. The ecological distribution of these amphipods appears to be in part determined by their ability to tolerate fluctuations in salinity and temperature. (Katz)
W77-03019

PRODUCTION BY BROOK TROUT (SALVELINUS FONTINALIS) IN FOUR STREAMS IN THE MATAMEK WATERSHED, QUEBEC,
Waterloo Univ. (Ontario). Dept. of Biology.
J. F. O'Connor, and G. Power.

Journal of the Fisheries Research Board of Canada, Vol. 33, No. 1, p. 6-18, January, 1976. 2 fig., 10 tab., 24 ref.

Descriptors: *Limiting factors, *Fish populations, *Food webs, *Productivity, *Brook trout, *Environmental effects, *Trout, *Stream fisheries, *Benthos, *Aquatic habitats, Salmonids, Biomass, Growth rates, Population, Streams, Biological communities, Fish diets, *Canada.
Identifiers: *Canadian shield, *Matamek River(Quebec).

Production by brook trout (Salvelinus fontinalis) in four infertile streams on the Canadian Precambrian Shield was estimated to be between 14.5 and 66.4 kg/ha per yr during 3 successive yr of study (1971-73). These values represent the range of total fish flesh elaborated annually in these streams because trout was the only species present. Differences between streams in annual production and P:B ratios arose from variations in stream cover (and its effect on carrying capacity), recruitment, and total biomass. Variations in age-specific growth rates were not critical. Production in the two most productive streams was judged to be controlled by food, while in the other two streams lack of suitable cover for adult trout limited production. (Katz)
W77-03020

ZINC UPTAKE BY ATLANTIC SALMON (SALMO SALAR) EXPOSED TO A LETHAL CONCENTRATION OF ZINC AT 3, 11 AND 19 C,
Guelph Univ. (Ontario). Dept. of Zoology.
P. V. Hodson.
Journal of the Fisheries Research Board of Canada, Vol. 32, p. 2552-2556, 1975, 1 tab., 1 fig., 24 ref.

Descriptors: *Zinc, *Tracers, *Absorption, *Radioisotopes, *Temperature, *Salmon, *Zinc radioisotopes, *Atlantic salmon, *Bioassay, *Toxicants, Laboratory tests, Analytical techniques, Metals, Inhibition, Mode of action.
Identifiers: *Bioaccumulation, Gills.

Atlantic salmon (Salmo salar) acclimated to 3, 11 and 19 C took up high concentrations of zinc in gill tissues during exposures to a nominal 14 mg/liter of zinc The rate of zinc uptake, as shown by isotopic zinc tracer, increased from a minimum of 3 C to a maximum of 19 C. In fish killed by zinc exposure, zinc concentrations in gills were highest at 19 C and lowest at 3 and 11 C. (Katz)

TEMPERATURE TOLERANCE OF YOUNG-OF-THE-YEAR LAKE WHITEFISH, COREGONUS CLUPEAFORMIS,
National Marine Fisheries Service, Ann Arbor, Mich. Great Lakes Fishery Lab.
T. A. Edsall, and D. V. Rottiers.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 177-180, 1976, 3 tab., 2 fig., 11 ref.

Descriptors: *Temperature, *Lethal limit, *Cisco, *Freshwater fish, *Environmental effects, *Heated water, Powerplants, Mortality, Resistance, Great Lakes, Water pollution sources, Size, Laboratory tests, Analytical techniques, *Thermal pollution.
Identifiers: *Coregonus spp., *Lake Whitefish, Temperature tolerance.

Laboratory tests indicated that the ultimate upper lethal temperature of young-of-the-year lake whitefish, Coregonus clupeaformis, an important food fish in the upper Great Lakes, was 26.65C. This value is similar to that reported for yearling bloaters, C. hoyi, at 26.75C and for young-of-the-year lake herring, C. artedii, at 26.0C. (Katz)
W77-03024

UPPER LETHAL AND PREFERRED TEMPERATURES OF THE SLIMY SCULPIN, COTTUS COGNATUS,
Fisheries and Marine Service, St. Andrews (New Brunswick). Biological Station.
P. E. K. Symons, J. L. Metcalfe, and G. D. Harding.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 180-183, 1976, 1 tab., 1 fig., 16 ref.

Descriptors: *Temperature, *Lethal limit, *Heated water, *Sculpins, *Environmental effects, *Clear-cutting, Mortality, Laboratory tests, Distribution, Methodology, Watershed management, Water pollution effects, *Thermal pollution.
Identifiers: *Cottus cognatus, Upper lethal temperatures, Preferred temperature.

Laboratory experiments showed the upper lethal and preferred (96-h LT60) temperatures of slimy sculpin (Cottus cognatus) acclimated at 20C were 25.0 and 13C, respectively. (Katz)
W77-03025

PHYSIOLOGICAL RESPONSES OF RAINBOW TROUT (SALMO GAIRDNERI) TO ELECTROSHOCK,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
C. B. Schreck, R. A. Whaley, O. E. Maughan, and M. Solazzi.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 76-84, 1976, 2 tab, 4 fig, 45 ref.

Descriptors: *Biochemistry, *Enzymes, *Mortality, *Fish physiology, *Rainbow trout, *Bioassay, *Electro-fishing, Analytical techniques, *Respiration, *Stress, *Metabolism, Oxygen sag, Environmental effects, Fishing, Sampling, Laboratory tests.
Identifiers: *Electrocardiogram, *Electroshocking.

Electroshocking caused an immediate increase in plasma corticoid and lactate concentrations and thrombocyte; leucocyte ratio in rainbow trout (Salmo gairdneri). Plasma glucose concentrations increased after 3 hours while protein, calcium, magnesium, and androgen levels were unaffected. Plasma lactate returned to preshock levels within 3 h, but corticoid and glucose concentrations were elevated for at least 6 h. Normal breathing was disrupted for 60 s post shocking. Breathing frequency did not increase, but buccal pressure increased substantially and returned to normal within 1 h. Cardiac activity was irregular immediately after shocking. The height of the T wave in EGGs increased 1-3 min after shocking. Responses exhibited are most likely attributable to combined effects of trauma, factors associated with paying off an oxygen debt and attributes associated with the general adaptation syndrome of stress. (Katz)
W77-03026

MOVEMENT OF YELLOW PERCH (PERCA FLAVESCENS) AND WHITE SUCKER (CATOSTOMUS COMMERSONI) IN A NEARSHORE GREAT LAKES HABITAT SUBJECT TO A THERMAL DISCHARGE,
Canada Centre for Inland Waters, Burlington (Ontario).
J. R. M. Kelso.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 42-53, 1976, 3 tab, 6 fig, 8 ref.

Descriptors: *Effluents, *Great Lakes, *Yellow perch, *Suckers, *Movement, *Distribution, *Fish behavior, *Heated water, *Water temperature, Water pollution sources, Thermal water, Temperature, Water pollution effects, Methodology, On-site data collection, *Thermal pollution.
Identifiers: *Catostomus commersoni.

The thermal discharge from the Nanticoke Generating Station caused both yellow perch (Perca flavescens) and white sucker (Catostomus commersoni) to increase sharpness of turns, decrease distance between turns, and to orient into the current generated by the discharge. Conversely, fish released in thermally unaffected habitat referenced movement to the shoreline, turned less sharply, and swam greater distances between turns. The tendency for localization of movement was increased for both species when in the influence of the discharge; however, these fish had to contend with currents generated by the effluent thus making comparisons anomalous. Exposure of fish to elevated temperatures was brief and ranged from a few excursions into thermally elevated areas to approximately 9 h. Fish transplanted from unaffected areas to the discharge areas showed behavior similar to fish caught and released at the discharge site. Two fish tracked when cooling was discharged at ambient temperature suggested that current had a role in causing the observed change in behavior. (Katz)
W77-03027

NEUROMUSCULAR FUNCTION AND ACETYLCHOLIN-ESTERASE IN THE PECTORAL ABDUCTOR MUSCLE OF LARGEMOUTH BASS (MICROPTERUS SALMOIDES) AS EVIDENCED BY THE EFFECTS OF DIISOPROPYLFLUOROPHOSPHATE,
Oregon State Univ., Corvallis. Dept. of Fisheries and Wildlife.
P. W. Schneider,Jr, and L. J. Weber.
Journal of the Fisheries Research Board of Canada, Vol. 32, p. 2153-2161, 1975, 1 tab, 4 fig, 2 ref.

Descriptors: *Organophosphorous compounds, *Biochemistry, *Fish physiology, *Enzymes, *Inhibitors, *Analytical techniques, *Bass, *Mode of action, Laboratory tests, Metabolism.
Identifiers: *Acetylcholinesterase, *Neuromuscular activity, *Diisopropylfluorophosphate, *DFP, Muscle function.

The significance of acetylcholinesterase (AChE) to neuromuscular transmission in the pectoral fin abductor muscle of largemouth bass (Micropterus salmoides) was evaluated by establishing in vivo first, the occurrence of enzyme inhibition by diisopropylfluorophosphate (DFP) and, second, the correlation between muscular response to it, direct stimulation and enzyme inhibition. Dose-response curves for inhibition of AChE by DFP indicated that DFP had access to and did inhibit AChE. Modification of the muscular response was observed and severity appeared to be positively correlated to AChE inhibition. The modification, however, was not typical of cholinergic systems in that the ability to produce and maintain a tetanus was never abolished even with inhibition in excess of 99% of control levels. It was concluded that AChE is not as important for neuromuscular transmission in largemouth bass as has been established for other vertebrates, and that the acute toxic effects of DFP to largemouth bass are not mediated by a collapse of neuroskeletal muscle function. (Katz)

DIELDRIN IN THE DIET OF CHANNEL CATFISH (ICTALURUS PUNCTATUS): UPTAKE AND EFFECT ON GROWTH,
National Marine Fisheries Service, Ann Arbor, Mich. Great Lakes Fishery Lab.
R. L. Argyle, G. C. Williams, and C. B. Daniel.
Journal of the Fisheries Research Board of Canada, Vol. 32, p. 2197-2204, 1975. 5 fig, 4 tab, 12 ref.

Descriptors: *Pesticide residues, *Growth rates, *Channel catfish, *Dieldrin, *Absorption, *Path of pollutants, *Fish diets, *Digestion, Laboratory tests, Analytical techniques, *Chlorinated hydrocarbon pesticides, Insecticides, Pesticides, Pollutant identification.
Identifiers: *Tissue analysis.

Fingerling channel catfish (Ictalurus punctatus) were given diets containing 0.4, 0.8, or 4.0 micrograms dieldrin/g of food for 210 days, followed by a dieldrin free diet for 56 days. Catfish receiving 4.0 micrograms dieldrin/g food gained about 17 percent less weight than the control fish in 210 days and about 35 percent less weight during the last 126 days of the 210-day period. No growth differences were apparent in the other test groups. Dieldrin accumulations were characterized by an immediate rapid rise in residual levels in the tissues, followed by a period during which concentrations were relatively stable. Residues in tissues decreased rapidly after dieldrin was withdrawn from the diet. Mean dieldrin half-life was 9.6 days. (Katz)

EXCRETION OF AMMONIA AND INORGANIC PHOSPHOROUS BY EUPHAUSIA PACIFICA AND METRIDIA PACIFICA AT DIFFERENT CONCENTRATIONS OF PHYTOPLANKTON,
British Columbia Univ., Vancouver. Inst. of Oceanography.
M. Takahashi, and T. Ikeda.
Journal of the Fisheries Research Board of Canada, Vol. 32, p. 2189-2195, 1975, 6 fig, 23 ref.

Descriptors: *Zooplankton, *Metabolism, *Nutrients, *Ammonia, *Phosphorous, *Organic wastes, *Phytoplankton, *Cycling nutrients, *Nutrient removal, Populations, Laboratory tests, Kinetics.
Identifiers: *Euphausia pacifica, *Metridia pacifica, Excretion.

Roles of excretion in the forms of ammonia and inorganic phosphorous were determined for Euphausia pacifica and Metridia pacifica at different phytoplankton concentrations. Nutrient uptake rate of the phytoplankton sample was determined using Michaelis-Menten kinetics. The gross excretion of nutrients by zooplankton was estimated by summing the apparent excretion and nutrient removed by phytoplankton. Two significant effects of phytoplankton on zooplankton excretion were recognized: rapid removal from the medium of nutrients excreted by zooplankton and increase in nutrient excretion by zooplankton. The increase in nutrient excretion by zooplankton due to adding phytoplankton was proportional to the amount of phytoplankton ingested. Compared with the excretion rate at zero phytoplankton density, the excretion rate increased 5 times at 15 micrograms chlorophyll a/liter for M. pacifica and 9 times at 70 micrograms chlorophyll a/liter for E. pacifica. (Katz)

Journal of the Fisheries Research Board of Canada, Vol. 33, No. 3, p. 581-600, March, 1976, 12 fig, 8 tab, 47 ref.

Descriptors: *Eutrophication, *Biomass, *Lake Erie, *Sampling, *Phytoplankton, *Diatoms, *Nannoplankton, Seasonal, Population, *Biological communities, Distribution, *Spatial distribution, *Primary productivity, Aquatic microorganisms, On-site data collections, Food chains.
Identifiers: *Species composition.

Surface samples of phytoplankton were collected from April to December 1970 from 25 stations distributed over Lake Erie. About 125-150 species were identified in each basin. Certain species were identified as common to all three basins, while some phytoplankton species typified each basin. Diatoms contributed least in the Eastern basin (36%) but showed high percentage in both Central (55%) and Western (58%) basins. Phytoflagellates increased from the west to east basins and appeared to be adaptable to different nutrient conditions. During July and August high biomass concentrations but uneven horizontal distribution was observed. Phytoplankton biomass ranged between 0.8 and 13. 2, 0.6 and 6.0 and 1.0 and 4.2 g/cubic meter in the Wester, Central, and Eastern basins, respectively. Inshore-offshore differentiation was observed in the Central and Eastern Basins with many peaks in the inshore region. Bsed on maximum biomass concentration the Lake Erie Western basin was classified as highly eutrophic, the Eastern basin as mesotrophic and the Central basin between the mesotrophic and eutrophic conditions. THE EMERGENCE OF INSECTS FROM A BRITISH RIVER WARMED BY POWER STATION COOLING-WATER. PART I. THE USE AND PERFORMANCE OF INSECT EMERGENCE TRAPS IN A LARGE, SPATE-RIVER AND THE EFFECTS OF VARIOUS FACTORS ON TOTAL CATCHES, UPSTREAM AND DOWNSTREAM OF THE COOLING-WATER OUTFALLS,
Central Electricity Generating Board, Ratcliffe-on-Soar (England). Freshwater Biology Unit.
T. E. Langford, and J. R. Daffern.
Hydrobiologia, Vol 46, No 1, p 71-114, 22 fig, 7 tab, 21 ref, 2 append.

Descriptors: *Environmental effects, *Water pollution effects, *Heated water, Temperature, Insects, Growth stages, Powerplants, River flow, *Thermal pollution, *Aquatic insects, Cooling water.
Identifiers: *Emergence patterns(Insects), *River Severn(UK).

The study was conducted upstream and downstream of Ironbridge A and B power stations on the River Severn. Traps used in catching adult emerging insects are described and their overall performance, total catches and species selectivity is related to the physical characteristics of the river. Some relationship was observed between emergence rates, river flow and temperatures but the data suggested that the most significant factor was river flow. Temperature increases did not appear to have a significant effect on the total numbers overall emergence period of Trichoptera, Ephemerptera and Megaloptera. (See also W77-03044) (Chilton-ORNL)
W77-03043

THE EMERGENCE OF INSECTS FROM A BRITISH RIVER, WARMED BY POWER STATION COOLING-WATER. PART II. THE EMERGENCE PATTERNS OF SOME SPECIES OF EPHEMEROPTERA, TRICHOPTERA, AND MEGALOPTERA IN RELATION TO WATER TEMPERATURE AND RIVER FLOW, UPSTREAM AND DOWNSTREAM OF THE COOLING-WATER OUTFALLS,
Central Electricity Generating Board, Ratcliffe-on-Soar (England). Freshwater Biology Unit.
T. E. Langford.
Hydrobiologia, Vol 47, No 1, 1975, p 91-133, 11 tab, 11 fig, 46 ref.

Descriptors: *Environmental effects, *Heated water, Water pollution effects, Temperature, Insects, Growth stages, Powerplants, *Thermal pollution, *Aquatic insects, *Mayflies, Water temperature, Cooling water.
Identifiers: *Emergence patterns(Insects), *River Severn(UK), *Megaloptera, *Trichoptera.

No evidence of early emergence patterns downstream from the power station were observed. Temperature increases reached 8C, maximum water temperatures reached 28C, total degree-hours increased to 24% more during the spring, and there was a four-week advance in degree-hour accumulation. Emergence for most species was observed at 12C to 28C. High temperatures did appear to halt emergence or shorten the emergence period. (See also W77-03043) (Chilton-ORNL)
W77-03044

FIDELITY OF THERMOPHILIC BLUE-GREEN ALGAE TO HOT SPRING HABITATS,
Oregon Univ., Eugene Dept. of Biology.
J. E. Jackson, Jr., and R. W. Castenholz.
Limnology and Oceanography, Vol 20, No 3, May 1975, p 305-322, 6 fig, 5 tab, 17 ref. NSF GB-31945X.

Descriptors: *Environmental effects, *Thermal pollution, *Heated water, *Hot springs, Algae, *Cyanophyta, Aquatic plants, *Wyoming, National Parks.
Identifiers: *Thermophilic plants, Willamette Valley(Wyo), *Yellowstone National Park.

Samples from the Yellowstone Plateau and the Willamette Valley were incubated in photoautotrophic medium at 14, 35, and 45C. Blue-green algae developed at 35C in samples from numerous habitats. At 45C, the growth of blue-green algae was apparent in samples taken from sources downstream of heated waters but not in samples taken above heated discharges. These results indicate generally that the number of indentifiable hot spring blue-green algal species in rivers and the number of recoverable colonies are inversely related to the distance downstream from the points of hot spring discharge. Thermophilic blue-green algae having a growth temperature optimum of over 45C have a high fidelity to heated water habitats in temperate or colder climates but some species may be established elsewhere in warmer areas. (Chilton-ORNL)

THE EFFECT OF THE DISCHARGE OF THERMAL EFFLUENT FROM A POWER STATION ON THE PRIMARY PRODUCTIVITY OF AN EPIPHYTIC ALGAL COMMUNITY,
Alberta Univ., Edmonton. Dept. of Botany.
M. Hickman, and D. M. Klarer.
Br. phycol. J., Vol 10, March 1975, p 81-91, 2 fig, 2 tab, 41 ref.

Descriptors: *Environmental effects, *Water pollution effects, *Thermal pollution, Heated water, Powerplants, Algae, Temperature, Biological communities, Standing crops, *Primary productivity, *Canada, Lakes.
Identifiers: *Epiphytic algae, *Lake Wabamun(Alberta).

Thermal discharges were shown to cause an increase in the standing crop size of the epiphyton associated with Scripus validus and the mean primary productivity increased as a result. Thermal discharges were also found to cause changes in species composition and dominance in algal communities. The most noticeable difference between heated and non-heated areas was the occurrence as dominants of Oedogonium and Spirogyra during the spring and late summer at the heated site. The heated water approximately doubled the photosynthetic index of the non-heated site samples suggesting that the algal populations in the non-heated area were not photosynthesising at optimum temperatures. Continuous flow of heated water appeared to cause a decrease in photosynthetic efficiency in the heated area. (Chilton-ORNL)

HETEROMORPHIC DEVELOPMENT OF AEDINE MOSQUITOES REARED AT ABNORMAL TEMPERATURES,
Illinois Univ. at Urbana-Champaign. Dept. of Entomology.
W. R. Horsfall.
Annals of Zoology, Vol 11, 1974, p 224-236, 15 fig, 28 ref.

Descriptors: *Environmental effects, *Temperature, *Mosquitoes, Sexual maturity, Laboratory tests, Reproduction, Gonads, Aquatic insects.
Identifiers: *Heteromorphic development(Insects).

Morphic variations in the adult stage of several species of mosquitoes were induced by different constant temperatures in the laboratory. The report includes descriptions of the modifications exhibited by the normally male-producing component when reared at constant temperatures of 21-28C. High temperature was found to inhibit the expression of the male features but not those of the female. Resulting adults are heteromorphic in degree of maleness according to the temperature. ntifiers: *Trout Brook(NB).

e parasite fauna of juvenile Atlantic salmon in out Brook was found to be composed of four mary species, the monogenean Discocotyle ittata (infecting 37.7% of the fish examined), digenean Crepidostomum farionis (40.5%), the matode Sterliadochona tenuissima (97.9%), and lochidium (32.0%). Six secondary species inted the juvenile salmon. Intensity of infection C. farionis and S. tenuissima was independent host age and sex. Males were found to be more vily infected with D. sagittata but this parasite s also independent of host age. No interactions re observed between season and host age nor ween season and host sex. D. sagittata was nd to be most abundant in summer and autumn, farionis and S. tenuissima in spring, and the chidium in autumn. Annual cycles of infection re indicated by relationships between changes parasite maturation and in seasonal abundance. ilton-ORNL)

THE EFFECT OF TEMPERATURE-SALINITY COMBINATIONS ON THE FUNCTIONAL WELL-BEING OF ADULT LYTECHINUS VARIEGATUS (LAMARCK) (ECHINODERMATA, ECHINOIDEA),
University of South Florida, Tampa. Dept. of Biology.
J. M. Lawrence.
Journal of Experimental Marine Biology and Ecology, Vol. 18, p 271-275, 1 tab, 15 ref.

Descriptors: *Environmental effects, *Salinity, *Temperature, Aquatic life, *Florida, Coasts, *Gulf of Mexico, Water temperature.
Identifiers: *Sea urchins, Lytechinus variegatus.

In 1971 large, dense aggregations of sea urchins were observed off the Florida Gulf coast. The aggregations were active in August and September but were dispersed with many dead individuals in October. The purpose of the present work was to ascertain the effect of various combinations of temperature and salinity on the viability of the sea urchins. The highest activity coefficient was found to be at 35% salinity and 28C. Increases in temperature and salinity above ambient levels had more effect on the urchins than decreases in temperature and salinity. A reduction of salinity to 25% along with an increase in temperature to 34C caused death of the urchins, while this level of reduction of salinity along with a decrease in temperature only reduced their viability. The area where the mass mortalities occurred is marked by large quantities of river discharge during rainy seasons and the waters are shallow resulting in extreme temperatures. (Chilton-ORNL)

DISTRIBUTION OF FISH SPECIES IN GREAT BEAR LAKE, NORTHWEST TERRITORIES, WITH REFERENCE TO ZOOPLANKTON, BENTHIC INVERTEBRATES, AND ENVIRONMENTAL CONDITIONS,
Fisheries and Marine Service, Winnipeg (Manitoba). Freshwater Inst.
L. Johnson.
Journal of the Fisheries Research Board of Canada, Vol. 32, No. 11, 1975, p 1989-2004, 8 fig, 6 tab, 47 ref.

Descriptors: *Environmental effects, *Competition, Ecosystems, Lakes, Oligotrophy, Arctic, *Zooplankton, Benthos, Benthic fauna, *Invertebrates, *Canada, *Distribution, Fish.
Identifiers: Species diversity, *Great Bear Lake(NWT).

Great Bear Lake is extremely oligotrophic and this is considered to have had the effect of reducing species diversity in the lake. Highest concentrations of benthic invertebrate were found in the upper 20 m with only Mysis relicta and Myoxocephalus quadricornis existing in measurable densities below 100 m. Salvilinus namaycush and M. quadricornis were found at depths from 3-400 m and at temperatures of 13.2C for M. quadricornis and 15C for S. namaycush. Whitefish were found only in the bays. Stizostedion vitreum, Lota lota, and Catostomus catostomus were found only at the periphery of the lake. Couesius plumbeus and Percopsis omiscomaycus were found in the headwaters and in Great Bear River but not in the lake. It was suggested the low number of species present in some arctic lakes is due to environmental or competitive exclusion rather than to ecosystem immaturity. (Chilton-ORNL)

INVESTIGATION OF THE SALMON (SALMO SALAR) SMOLT MIGRATION OF THE BIG SALMON RIVER, NEW BRUNSWICK, 1966-72,
Fisheries and Marine Service, Halifax (Nova Scotia). Dept. of Environment.
B. M. Jessop.
Technical Report Series No. MAR/T-75-1, 57 p, 5 fig, 28 tab, 30 ref, 6 append.

Descriptors: *Ecology, *Biorhythms, *Migration, Fish behavior, *Fish migration, *Smolt, *Salmon, Data collections, Water flow, Temperature, Size, Fish populations, Timing, *Canada.
Identifiers: Big Salmon River(NB).

A counting fence near the mouth of the Big Salmon River was used to collect data on the timing and duration of Atlantic salmon smolt migration, and on smolt numbers, sizes, sex ratios, and ages. During each year of the study, the timing of smolt migration was between May 7-28 to June 15-July 13. The 6 year mean average of numbers of smolt counted was 15,570. A relationship was observed between timing of the smolt run and water level and water temperature. Most smolts (90%) migrated at night but the number of smolts migrating during daylight hours increased during the latter part of the run. Mean smolt lengths ranged from 13.5 to 15.1 cm and were significantly different between years. Smolt yield for all ages was 4.0/100 sq. meters. (Chilton-ORNL)

Descriptors: *Pulp wastes, *Water pollution control, *Bleaching wastes, *Sulfite liquors, Lignins, Wastes, Industrial wastes, Pollutants, Water pollution sources, Evaporators, Acids, Chlorination.
Identifiers: *Sulfite pulp mills, Lignosulfonic acids, Condensates, Alkaline extraction, Chlorolignins, Spills, Pulp washing, Pulp bleaching, Wood extractives.

Collection of at least 98% of the waste liquor is the primary measure proposed. The proposed combination of diffusion and filter washing has proved effective with fir and beech. A closed separation (screen room) with no effluent is included. Such extensive effluent control will have long-term success only with elimination of accidental spills. A possible solution is described. Three types of water pollutants may come from evaporator condensates: lignosulfonic acids, volatile neutral compounds like furfural and methanol, and volatile acids like acetic. Reduction of contamination by each of these types is discussed. Effluent contamination from the bleach plant is a special problem; 70-90% of this results from the chlorination and alkaline extraction steps. A possible measure for reducing chlorolignins and alkaline extractives in the bleaching effluent is described. (Ward-IPC)

INVESTIGATION OF COMMERCIAL CHROME-TANNING SYSTEMS: PART VI. FULL-SCALE TRIALS OF CHROME LIQUOR RECYCLING AND THE IMPORTANCE OF SALT CONCENTRATION,
Commonwealth Scientific and Industrial Research Organization, Melbourne (Australia) Div. of Protein Chemistry.
J. E. Burns, D. E. Colquitt, M. H. Davis, and J. G. Scroggie.
Journal of the Society of Leather Technologists and Chemists, Vol 60, No 4, p 106-112, July/August, 1976. 3 fig, 4 tab, 19 ref

Descriptors: *Tannery wastes, *Waste water treatment, *Recycling, *Chromium, *Industrial wastes, Symbiosis, Reclamation, Chemical wastes, Liquid wastes, Effluents, Water reuse
Identifiers: Tanneries.

A method for recycling chrome tanning liquors which is suitable for short pickling times is described. Spent chrome liquor is used as a base for the preparation of the pickle liquor for the following pack of hides or skins. Between each cycle, the spent liquor is reconstituted by the addition of the full amount of mineral acid normally used in pickling together with a reduced amount of the desired masking agent. The conventionally delimed/bated pelt is then pickled with this liquor for the desired time after which the calculated reduced amount of the chrome reagent is added to give the usual total chromium concentration. Control of ionic strength during pickling/tanning with the recycled liquors is vital for maintaining leather quality, and this can be achieved by simply controlling specific gravity despite a progressive change from a chloride to a sulfate pickle system during the process. The concentration of chromium appearing in the tannery effluent can be greatly reduced with careful attention to the recovery of all chromium-containing liquors. (Kreager-FIRL)

THE CONTROL OF WATER POLLUTION AND THE DISPOSAL OF SOLID WASTES IN THE INDUSTRIES PRODUCING BASIC INORGANIC CHEMICALS,
Imperial Chemical Industries Ltd., London (England). Engineering Services Dept.
F. J. Wagstaffe.
Pure and Applied Chemistry, Vol. 45, No. 3/4, p 141-145, 1976. 7 ref.

Descriptors: *Industrial wastes, *Chemical industry, *Waste water treatment, *Recycling, *Chemical wastes, Solid wastes, Suspended solids, Separation techniques, *Inorganic compounds, Bubbles, Flocculation, Mercury, Calcium sulfate.
Identifiers: Magnetic separation.

Developments in the control of water pollution generated by the basic inorganic chemicals industry are reviewed. The use of diaphragm cells rather than mercury cells for the manufacture of chlorine is one means of reducing mercury pollution from chlor-alkali plants. A development in the removal of suspended solids from effluents containing a few hundred milligrams/liter of such solids involves the use of tube modules in conventional horizontal flow clarifiers. A technique in which gas bubbles are induced to attach themselves to flocculated solids permits the removal of the solids and floc in an overflow rather than an underflow manner. High gradient magnetic fields are being used to remove finely divided magnetic solids from aqueous streams. The recovery of waste calcium sulfate from the manufacture of phosphoric and hydrofluoric acids is being investigated as a solution to the inorganic chemicals industry's most important single solid waste disposal problem. THE CATALYTIC WET OXIDATION OF STRONG WASTE WATERS,
Catalytic Inc., Charlotte, N. C.
A. K. Chowdhury, and L. W. Ross.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 46-58, 1975. 1 fig, 10 tab, 11 ref

Descriptors: *Oxidation, *Catalysts, *Waste water treatment, *Chemical oxygen demand, *Organic compounds, Liquid wastes, Chemical wastes, Kinetics, Chemical reactions, Pressure, Temperature, Oxygen, Efficiencies, Performance Evaluation, Sulfates, Iron compounds, Copper sulfate, Oxides
Identifiers: Fenton catalysts, Platinum oxide, Hydrogen peroxide

Catalysts for the wet oxidation of strong waste waters (chemical oxygen demand of 3500-15,000) were investigated. Copper sulfate, ferric sulfate and hydrogen peroxide were the most effective catalysts over a wide pH range (2.8-7.0), with typical chemical oxygen demand reductions of over 95% being achieved at 400 F. Fenton catalyst produced comparable results but only at a pH of 2.5. Platinum oxide gave the best results among various solid catalysts tested. The pressure of the reaction system did not exert any effect on catalytic wet oxidation over a range of 300-900 pounds/sq in. Air was as effective as oxygen in carrying out the oxidation reactions as long as adequate oxygen was maintained with proper stirring. Beyond temperatures of 400 F, a leveling of of the catalytic oxidation rate was observed. Catalytic oxidation of waste water obeyed first order kinetics. Wet oxidation is most effective when the organic content of the solution to be treated is high (chemical oxygen demand of more than 3500 milligrams/liter); thus the efficient operation of the process, a pretreatment step for increasing the organic concentration is necessary. (Kreager-FIRL)

APPLICATION OF ULTRA FILTRATION REVERSE OSMOSIS TECHNIQUE FOR THE FRACTIONATION OF CHEESE WHEY - A WASTE DISPOSAL OF THE DAIRY INDUSTRY,
Central Salt and Marine Chemicals Research Inst., Bhavnagar (India)
A. V. Rao, B. J. Bhalala, and D. J. Mehta.
Indian Chemical Journal Vol. 10, No. 12, p 19-23, June, 1976. 3 fig, 2 tab, 4 ref

Descriptors: *Dairy industry, *Food processing industry, *Filtration, *Reverse osmosis, *Waste

vater treatment, Byproducts, Recycling, Separa-ion techniques, Liquid wastes, Proteins, Chemi-al oxygen demand, Industrial wastes, Efficien-ies, Performance, Membrane processes, Mem-ranes, Water reuse, Nutrients.
dentifiers: Sugars, Lactose.

Jltrafiltration membrane optimization studies vith cellulosic polymers were conducted to levelop a suitable membrane for the separation of rotein and lactose from cheese whey which is ften disposed of as liquid waste. Protein rejection y the membrane was maintained at over 90% hroughout the entire operation, and lactose rejec-ion was kept at a minimum of 2.0%. About 80% of he lactose and 70% of the protein originally resent in the cheese whey appear to be recovera-le in the ultrafiltrate and concentrate, respective-y. The ultrafiltrate can be further concentrated in reverse osmosis unit to reduce the chemical ox-gen demand level of the protein-free filtrate. The ermeate from this second stage can then be eused in dairies as fresh water. (Kreager-FIRL)

AEROBIC AND ANAEROBIC MICROBIAL TREATMENT ALTERNATIVES FOR SHELLFISH PROCESSING WASTEWATERS IN CONTINUOUS CULTURE,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
F. G. Pohland, and J. W. Hudson.
Biotechnology and Bioengineering, Vol. 18, No. 9, p 1219-1247, September, 1976. 13 fig, 2 tab, 11 ref.

Descriptors: *Food processing industry, *Waste water treatment, *Biological treatment, *Aerobic conditions, *Anaerobic conditions, Kinetics, Model studies, Microorganisms, Organic compounds, Solid wastes, Separation techniques, Hydraulics, Methane, Efficiencies, Oxidation, Shellfish, Industrial wastes.
Identifiers: Shellfish processing.

Aerobic and anaerobic microbial treatment of shellfish processing waste water were investigated, and a kinetic model based on continuous culture kinetics was developed for the former treatment scheme. Aerobic oxidation of shellfish processing waste water were investigated, and a kinetic model based on continuous culture kinetics was developed for the former treatment scheme. Aerobic oxidation of shellfish processing waste water proved to be a satisfactory means of reducing soluble organic constituents to acceptable levels and the results of bench-scale studies were amenable to continuous culture analysis with kinetic models which enabled certain design and/or operational criteria to be formulated. A critical hydraulic retention time about 2 hr was estimated for single-pass treatment modes; and with solids recycle, the critical hydraulic retention time could be reduced to about 1 hr. The efficiency of biological solids separation was markedly affected by changes in applied dilution rates and was of major importance in determining the best operating mode and overall system performance. The kinetic description of anaerobic biological treatment using continuous culture analysis was not achieved. However, anaerobic treatment exhibited a limited potential for waste water stabilization in that soluble substrate removals and methane production occurred at all retention times. Solids recycle tended to increase treatment efficiencies in both aerobic and anaerobic processes. (Kreager-FIRL)

SYNCRUDE VOWS ENVIRONMENTAL RESPONSIBILITY,
Syncrude Canada Ltd., Edmonton (Alberta).
O. Tost.
Hydrocarbon Processing, Vol. 55, No. 10, p 102-106, October 1976. 1 fig.

Descriptors: *Oil industry, *Reclamation, *Mining, *Oil wastes, *Environmental engineering, Industrial wastes, Revegetation, Runoff, Erosion, Surface water, Research priorities, Programs.

Syncrude's environmental protection program for its 17,000-acre synthetic crude oil projects in Alberta, Canada's Athabasca Tar Sands, the worlds' largest open pit mining and reclamation operation, is outlined. Initial environmntal work was started by Syncrude in 1962 and centered on broad baseline studies of the surrounding soil, vegetation, water, animal and bird populations, and atmospheric patterns. About $300 million is being spent on environmental research and pollution control systems for the open pit mining operation which is projected to come on stream in mid-1978. Syncrude's long-range goal is to revegetate with native grasses and trees the 10 sq mi comprising the mine site once the area is mined out. The most difficult task is expected to be establishing growth on the tailings dike that surrounds the 10-square-mile tailings pond in order to prevent erosion and washout and to contain runoff from polluting nearby rivers and streams. The dike which will range from 10-180 ft high will contain the sand, water, and unrecoverable effluent from the bitumen extraction process. (Kreager-FIRL)

IMPACT OF WATER CONSERVATION IN THE DESIGN OF MODERN OIL REFINERIES,
Fluor Engineers and Constructors, Inc., Los Angeles, Calif.
H. J. Klooster, and R. A. Beardsley.
American Institute of Chemical Engineers Symposium Series, Vol. 71, No. 151, p 14-24, 1975. 4 fig, 7 tab, 4 ref.

Descriptors: *Oil industry, *Reclaimed water, *Water conservation, *Water reuse, *Waste water treatment, Industrial wastes, Liquid wastes, Symbiosis, Reclamation, Ammonia, Hydrogen sulfide, Dewatering, Sludge, Filtration, Recycling, Design.

Water conservation measures for modern oil refineries are outlined. The first step in the process of reducing waste effluents is to segregate wastes streams according to the degree of treatment required. Sour condensates produced in crude units and hydrocrackers can be reused as crude condenser wash water, desalter wash water, and/or recycled water for the hydrocracker after simple stream stripping to remove ammonia and hydrogen sulfide. High mineral, non-toxic salt concentrated streams which are not contaminated with organics can be reused for various process requirements after desalination and/or mechanical evaporation. Some waste streams containing non-hardness and non-siliceous mineral salts but otherwise contaminated with organics may be used as cooling tower makeup. Filter backwash may be recycled to the inlet of the clarifier without any added treatment, and the recycled filtrate may aid in the solids settling rate in the clarifier, thereby enhancing the clarifier operation. Decant water from sludge dewatering may also be recycled to the clarifier feed. (Kreager-FIRL)

EIGHTH MEETING OF THE IULTCS TANNERY WASTES COMMISSION, SVENDBORG, DENMARK, 21ST TO 23RD MAY 1975.
Journal of the Society of Leather Technologists and Chemists, Vol 60, No 4, p 95-105, July/August, 1976. 7 tab, 18 ref.

Descriptors: *Tannery wastes, *Waste water treatment, *Biological treatment, *Water reuse, *Waste disposal, Solid wastes, Sludge, Denitrification, Filtration, Separation techniques, Industrial wastes, Membranes, Oxygen demand, Chromium, Sulfides, Sewage, Effluents, Physical control, Analytical techniques, Byproducts, Symbiosis, Toxicity.
Identifiers: Tanneries.

The following annual reports on topics dealing with tannery wastes were presented at the eighth meeting of the IULTCS Tannery Wastes Commission. Methods for Depilation (W. Frendrup); Improvements in the Uptake of Tannins by Skin (A. J. J. van Meer); Sulphide Oxidation (A. J. J. van Meer); Methods of Biological Treatment (A. J. J. van Meer); Toxic Effects of Sulphide and Chromium (D. R. Corning); Mixing of Tannery Effluent with Domestic Sewage (W. Frendrup); Sludges - Storage and DIsposal (M. Aloy); Specific Criteria for the Discharge of Tannery Effluents (J. Gauglhofer); Charging for Tannery Waste Water Disposal (Mr. van Vlimmeren); Disposal of Solid Wastes (L. Feikes); Reuse of Water (B. Gorecki and J. Ludvik); and Chemical Treatment of Tannery Effluents (L. Feikes and L. Del Pezzo). In addition to these topics, the following other subjects were discussed: new developments in the treatment of tannery wastes, chromium recovery methods, sludge applications in agriculture, denitrification studies, the organization of an international symposium on tannery wastes, analytical methods for determining oxygen demand parameters, membranes for ultrafiltration units, statistics on the incidence of anthrax, and the maximum admissible concentration limits for aluminum in waste water. HANDLING DISCHARGES FROM WASTE OIL PROCESSING,
Recon Systems, Inc., Princeton, N.J.
N. J. Weinstein, and R. M. Wolfertz.
Industrial Wastes, Vol 22, No 5, p 50-52, September/October, 1976. 2 fig, 4 tab.

Descriptors: *Oil industry, *Sludge disposal, *Waste water treatment, *Oil wastes, *Waste disposal, Recycling, Separation techniques, Neutralization, Lagoons, Landfills, Industrial wastes, Chemical wastes, Dissolved solids, Suspended solids, Phenols, Metals, Organic compounds, Byproducts.
Identifiers: Oil re-refining.

The treatment and disposal of sludges and waste waters generated during oil re-refining operations are reviewed. Acid sludge which contains metals, combustibles, and oil must be handled carefully because of its high acid content, and currently all acid sludge disposal by refineries in the United States is to landfills or lagoons, usually without neutralization. Spent clay is ordinarily disposed of to landfills, although some uses for it have been found, for example, unpaved road stabilization. Other wastes such as filter and centrifuge sludges, tank cleaning sludges, furnace coke, combustion ash, waste water flocs, and scums are normally disposed of with refuse or separately landfilled, although oil recovery by dewatering and blending may be practices on some tank sludges. Distillation bottoms are either stored in lagoons or used as an asphalt blending stock. Oil/water separation and neutralization are used to treat process waste water, and cooling water is sometimes recycled or occasionally joined to other waste streams entering an oil/water separator. Waste water from oil re-refining operations generally contains traces of metals, dissolved and suspended solids, dissolved phenols, and other organics. (Kreager-FIRL)

BIOLOGICAL PROCESS FOR EFFLUENT AND WASTE TREATMENT AS APPLIED IN THE PAPER INDUSTRY,
B. Morgeli, and J. Gnieser.
Sulzer Technical Review, Vol. 58, No. 2, p 85-88, 1976. 6 fig, 1 tab, 10 ref.

Descriptors: *Pulp and paper industry, *Biological treatment, *Activated sludge, *Pulp wastes, *Waste water treatment, Industrial wastes, Microorganisms, Biodegradation, Aeration, Liquid wastes, Recycling.

The use of biological treatment for purifying liquid wastes generated by the pulp and paper industry is discussed. A biological treatment process which is capable of accommodating operational disturbances and variations in the quality and quantity of the waste to be treated is outlined and involves the use of activated sludge treatment with sludge reaeration. Return sludge for the biological treatment is prepared in a separate sludge tank in which the microorganisms that are grown in the activation tank remain alive for longer periods of time. The return sludge can thus not only be supplied to the process in metered quantities but can also be altered in terms of microorganism activity. (Kreager-FIRL)

ADVANCED TREATMENT OF PULP WASTE WATER (PARAPU HAISUI NO KODO SHORI),
M. Koseki, and N. Mimoto
Sumitomo Jukikai Giho (Sumitomo Shipbuilding and Machinery), Vol. 24, No. 71, p 88-92, August, 1976. 12 fig, 4 tab, 5 ref.

Descriptors: Pulp and paper industry, *Activated sludge, *Waste water treatment, *Adsorption, *Coagulation, Activated carbon, Sedimentation, Biological treatment, *Pulp wastes, Chemical wastes, Industrial wastes, Liquid wastes, Evaluation, Performance.

Activated sludge treatment of pulp waste water was evaluated. Activated sludge treatment not only improved water quality but also permitted a large reduction in the chemical dosage required for subsequent coagulation-sedimentation. Activated sludge treatment also permitted greater adsorption of pollutants during activated carbon treatment. Chemical oxygen demands of less than 200 milligrams/liter appear to be attainable by using a combination of activated sludge, coagulation-sedimentation, and activated carbon adsorption treatment. SOME INTERNAL MEASURES FOR THE REDUCTION OF THE EFFLUENT LOAD SHOWN BY THE EXAMPLE OF A CALCIUM-BISULPHITE PULPMILL (EINIGEINNERBETRIEBLICHE MASSNAHMEN ZUR VERMINDERUNG DER VERFLUTERBELASTUNG, DARGESTELLT AM BEISPIEL EINER CALCIUMBISULFIT-FABRIK),
J. P. Franzreb.
Das Papier, Vol. 30, No. 9, p 384-389, September, 1976. 6 fig, 4 ref.

Descriptors: Pulp and paper industry, *Waste water treatment, *Sulfite liquors, *Pulp wastes, *Bleaching wastes, Effluents.

A number of different measures are proposed for the reduction of effluent load at a calcium bisulphite pulpmill. First is the collection of at least 98% of the digester waste liquor. A combination of diffusion and filter washing with effluent-free closed separation has proved effective for fir and beech wood. The success of such an operation depends on the exclusion of uncontrolled accidental losses. Three groups of damaging materials are distinguished which can lead to secondary contamination as evaporation condensates; the problem of their reduction is discussed. From 70-90% of effluent contamination by bleaching plant effluents result from the chlorination and/or alkaline extraction step. Measures to eliminate this are described. (Miller-FIRL)

WASTE TREATMENT ADVANCES: WASTE WATER TREATMENT VIA ACTIVATED CARBON,
Calgon Corp., Pittsburgh, Pa.
D. G. Hager.
Chemical Engineering Progress, Vol. 72, No. 10, p 57-60, October, 1976. 5 tab, 7 ref.

Descriptors: *Activated carbon, *Adsorption, *Textiles, *Waste water treatment, *Treatment facilities, Color, Carbon, Organic compounds, Phenols, Efficiencies, Performance, Evaluation, Chemical wastes, Industrial wastes
Identifiers: Textile industry.

The effectiveness of activated carbon adsorption in reducing total organic carbon, color, and phenol was evaluated for 107 industrial waste water samples, including 16 samples from the textile industry. Total organic carbon removals of greater than 85% were observed in 79 out of 102 samples; 95% color removal was observed in 16 out of 16 samples, and 99% phenol removal was achieved in 5 out of 5 samples. A total of 15 full-scale industrial adsorption systems have been placed in operation throughout the United States since 1973 to treat a variety of dissolved organic contaminants. Flows range from 6000 to more than 1 million gallons/day, with carbon contact times ranging from 8 min to about 23 hr. All of the plants rely on off-site carbon reactivation. (Kreager-FIRL)

TREATING EFFLUENT CONTAINING COMPOUNDS PREF. DYES - BY ADDING SALT GENERATOR OF OPPOSITE CHARGE TO EFFLUENT ION THEN ULTRA-FILTERING.
Belgian Patent BE-838-926. Issued August 25, 1976. Derwent Belgian Patents Abstracts, Vol. X, No. 37, p D2, October 10, 1976.

Descriptors: *Patents, *Tannery wastes, *Waste water treatment, *Filration, *Separation, Chemical reactions, Ions, Salts, Industrial wastes, Chemical wastes, Membranes, Pressure.
Identifiers: Tanneries, Ultrafiltration, Salt formation.

A patent for a process that removes water-soluble ionic compounds from tanning effluents is described. The process involves the addition of a water-soluble salt generator which carries a charge that is opposite that on the ionic compound to be removed. This salt generating compound is prefereably of high molecular weight. After salt formation, the effluent is subjected to ultrafiltration under pressure. High flow rates can be obtained with the method, and a semi-permeable membrane which would be unsuitable for filtering the untreated effluent may be used to filter the treated effluent. (Kreager-FIRL)
W77-02612

AIR AND WATER PURIFICATION - WITH ACID CHLORITE SOLUTION.
German Patent DS 2223-790. Issued August 26, 1976. Derwent German Patents Abstracts, Vol. X, No. 36, p D2, October 13, 1976.

Descriptors: *Patents, *Tannery wastes, *Air pollution, *Waste water treatment, *Industrial wastes, Pollution abatement, Gases, Liquid wastes, Nitrogen compounds, Sulfur compounds, Hydrogen sulfide, Alcohols, Organic acids, Acidity, Chemical reactions
Identifiers: Mercaptans, Fatty acids.

A patent for a tanning waste purification process is described. Both waste gases and waste waters containing alcohols, aldehydes, fatty acids, and sulfur and nitrogen-containing compounds like hydrogen sulfide, mercaptans, and tryptophane are purified by treatment with alkali or alkaline earth chlorites in an acid medium at a pH of less than 6 and a temperature of 80 C. The process results in the formation of nontoxic products in an inexpensive manner and without the risk of explosion. (Kreager-FIRL)
W77-02613

LEATHER INDUSTRY EFFLUENT PURIFICATION - BY ACIDIFICATION PRIOR TO LIME TREATMENT AND SEPARATION BY FLOTATION.
Soviet Patent SU-487-024. Issued February 25, 1976. Derwent Soviet Inventions Illustrated, Vol. X, No. 35, p D4, October 6, 1976.

Descriptors: *Patents, *Tannery wastes, *Waste water treatment, *Lime, *Flotation, *Separation techniques, Chromium, Proteins, Suspended solids, Chemical wastes, Industrial wastes, Liquid wastes, Acidity, Alkalinity.
Identifiers: Tanneries, Leather industry.

A patent for a tannery effluent purification process is described. The process involves a lime treatment and pressure flotation separation. Protein, chromium compounds, and suspended solids are better removed by prior acidification of the effluent to a pH of 4.5. After this initial step the deposit is removed in a flotation tank, and the pH of the effluent is adjusted to 7.5-8.0 with lime. Final separation is achieved by pressure flotation. (Kreager-FIRL)

Identifiers: Noxfish, Dibrom, Juglone, MS-222, Benzocaine.

Activated carbon was effective in removing fish toxicants and anesthetics from water solutions. Its capacity to adsorb 3-trifluoromethyl-4-nitrophenol (TFM), antimycin, Noxfish(R) (5% rotenone), Dibrom(R), juglone, MS-222, and benzocaine ranged from 0.1 to 64 mg per gram of carbon. The adsorptive capacity of activated carbon for removal of TFM was determined at several column depths, temperatures, pH's and flow rates. Adsorptive capacity increased when the contact time was increased by reducing the flow rate or increasing the column depth. The adsorptive capacity was not significantly influenced by temperature but was substantially higher at pH 6.5 than at higher pH's tested. A practical and efficient filter for purifying chemically treated water was developed. (Katz)

PHOSPHORUS REMOVAL DEMONSTRATION STUDY USING FERRIC CHLORIDE AND ALUM AT C.F.B. UPLANDS,
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Centre.
W. E. Stepko, and E. E. Shannon.
Technology Development Report EPS 4-WP-74-5, Environmental Protection Service, June, 1974, 63 p., 4 app., 9 fig., 18 tab, 10 ref.

Descriptors: *Waste water treatment, Sludge, Detergents, *Activated sludge, Suspended solids, Sewage treatment, Phosphorus, Aeration, *Canada.
Identifiers: *Phosphorus removal, *Ferric chloride, *Alum, Raw sewage, Aeration tanks, Aeration tank effluents, Raw waste waters, Clarification.

Full scale phosphorus removal studies were conducted on the activated sludge wastewater treatment plant at C.F.B. Uplands. Wastewater characteristics and treatment plant performance were closely monitored under baseline conditions (no chemical addition) and at various ferric chloride and alum addition levels. The addition of either alum at 17.5 mg/l as Al, or ferric chloride at 30 mg/l as Fe was capable of producing a secondary effluent averaging 1 mg/l total phosphorus. The phosphorus removal efficiency was greatly influenced by plant flow. Consistent removals were only obtained with flows at or below plant design, corresponding to secondary clarifier overflow rates of 700 Igal per sq. ft. or less. At flows greater than design, total phosphorus removals were affected by the excessive transport of solids over the secondary clarifier weir. Based upon the addition points (raw sewage, aeration tank or aeration tank effluent) evaluated, all locations were equally effective in removing filterable phosphorus. However, at flows greater than design, better overall phosphorus removals were achieved during the raw sewage (primary) additions. The effect of the 1973 Canadian laundry detergent reformulation upon reducing phosphorus loading to the treatment plant was observed. (Environment Canada)

COMPUTER-AIDED PLANNING OF REGIONAL SLUDGE DISPOSAL SYSTEMS, USER'S MANUAL,
B and P Engineers, Kitchener (Ontario).
F. J. Allan, P. L. Silveston, and W. L. Keay.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 46, Environmental Protection Service, Environment Canada, Ottawa, Canada, September 1976, 409p., 60 fig., 38 tab, 10 ref. 10 append. 73-5-8.

Descriptors: *Sludge disposal, Computers, *Planning, Costs, Publications, Administration, *Computer programs, Data collections, Lagoons, Landfills, Regional analysis, Model studies, Waste disposal, *Canada.
Identifiers: Niagara, Ontario, Land disposal.

This training manual introduces potential users to the concepts of computer-aided planning, the models for sludge disposal that are imbedded in the computer programs, and the information which must be developed in order to use the programs. It is a source book for setting up a data collection program to be used with computer-aided planning. It contains the coding which transforms the data into the proper form for processing by a computer. Detailed information is provided on the structure of the computer program, so that it can be modified for special purposes or expanded to handle different planning problems such as refuse disposal. A general purpose computer program applicable to the optimization or regional sludge disposal systems is described. The model upon which the computer program is built is a network of transport routes connecting nodes which represent sources of sewage sludge, intermediate facilities for processing or the temporary storage of sludge (such as vacuum filters or lagoons), and dead-end facilities for ultimate disposal (such as landfill or land spreading sites). (Environment Canada)
W77-02745

EFFECT OF STORAGE ON STORM AND COMBINED SEWERS,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
J. G. Henry, and P. A. Ahern.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 34, Environmental Protection Service, Environment Canada, Ottawa, Canada, February 1976, 106p., 27 fig., 19 tab, 27 ref, 2 append. 74-8-1.

Descriptors: *Storage, *Water storage, *Roofs, *Sewers, Storm runoff, Reservoir storage, Costs, Alternative planning, Storm drains, Storm water, *Canada, *Combined sewers, Watershed(Basins).
Identifiers: *Roof ponding, Ontario.

The effect of storage on storm and combined sewers has been investigated for residential subdivision of approximately 100 acres area, under development in Southern Ontario. The storage methods examined were: ponding of rainfall on flat roofs; on-side storage of roof runoff; storage of flows from street gutters at catch basins; and holding reservoirs as part of the sewer network. A hydrograph model for estimating stormwater runoff from residential areas has been developed and incorporated in a computer program. The model was used to determine the outflow hydrograph at the storm sewer outfall from the subdivision for a synthetic two-year design storm. An alternative design, replacing the separate sanitary and storm sewers by combined sewers, was carried out and the outflow hydrograph from a combined sewer network was determined. The effects of different storage methods on the outflow hydrograph were tested for both the separate and combined systems. Substantial reductions in peak flow were found to occur as the level of storage was increased, with holding reservoirs providing the greatest reductions. Cost data from the original separate system design was used to calibrate formulae for estimating sewer pipe costs. The total costs of systems incorporating various storage options were compared. A combined sewer system was found to be slightly less expensive than the separate system and small savings in subdivision sewer costs resulted when storage was incorporated. (Environment Canada)

DIRECT PHYSICOCHEMICAL TREATMENT WITH OZONE,
Sherbrooke Univ. (Quebec). Dept. of Chemical Engineering.
J. P. Jones, and J. Dufort.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 32, Environmental Protection Service, Environment Canada, Ottawa, Canada, February 1976, 59p., 21 fig., 5 tab, 9 ref, 3 append. 72-5-16.

Descriptors: *Ozone, *Waste water treatment, *Chemicals, Biochemical oxygen demand, Efficiencies, Suspended solids, *Filtration, *Filters.
Identifiers: Clarification unit, Chemical clarification, Sand filtration, Dual media filters.

A pilot study of direct physicochemical treatment of wastewaters using ozone is described. The pilot plant consisted of three principal elements: a chemical clarification unit, an ozone contact section, and a dual media filter. The chemical clarification unit removed up to 95% of the suspended solids in the raw sewage food. The ozone contact section consisted of four spray contactors. These were generally sufficient to reduce the soluble BOD5 by 40%. The filter served to polish the effluent by removing the last traces of suspended solids. The amount of ozone needed to reduce the BOD5 and the TOD in the effluent of a chemical clarification unit to acceptable levels has been studied. The amount was found to depend principally on the initial TOD and to be a weaker function of other variables. The stoichiometric efficiency of ozone was increased by providing holding time between contactors. Treatment with eight ozone contact stages resulted in an effluent with a BOD5 of 16 mg/l. A comparative economic study was made of direct physicochemical treatment with activated carbon. The cost of the ozone process was 17% higher. However, credit was not allowed for the disinfection and aeration which occurred during ozonation. (Environment Canada)

PHOSPHORUS REMOVAL WITHIN EXISTING WASTEWATER TREATMENT FACILITIES,
Ontario Ministry of the Environment (Toronto)
B. I. Boyko, and J. W. G. Rupke.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 44, Environment Protection Service, Environment Canada, Ottawa, Canada, August 1976, 43p., 9 fig., 5 tab, 26 ref. 71-1-1.

Descriptors: *Phosphorus, *Water pollution control, *Treatment facilities, Waste water treatment, Coagulation, Costs, Effluents, Chemicals, Ponds, Anaerobic digestion, Sewage, *Canada.
Identifiers: *Phosphorus removal, *Ontario.

Various projects were undertaken to assist in the implementation of the Province of Ontario's phosphorus control program. Under this five-year program, phosphorus removal was to be initiated on the discharges of more than 170 existing wastewater treatment plants serving some five million persons. In order to implement this program, a methodology to predict the coagulant best suited for phosphorus removal at any particular treatment facility was required. It was also necessary to determine whether the chemicals used for phosphorus removal would have any physical or process effects on present wastewater treatment processes, facilities, methods of sludge treatment, and subsequent sludge disposal practices. This report discusses coagulation and prime coagulant selection, and the operational results problems and design considerations derived from a series of full scale studies. The study concluded that phosphorus removal may be readily implemented with minimal capital expenditure at operating municipal wastewater treatment facilities of a designs currently in use in Ontario. (Environment Canada)

ANAEROBIC DIGESTION OF LIME SEWAGE SLUDGE,
Ontario Ministry of the Environment, Toronto
Pollution Control Branch.
S. A. Black.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No 50, Environmental Protection Service, Environment Canada, Ottawa, Canada, 1976. 17 p, 1 fig, 1 tab, appendix 71-1-18.

Descriptors: *Sludge, *Anaerobic digestion, *Lime, Sewage treatment, Treatment facilities, Phosphorus, Disposal, Land, Municipal wastes, Gases, Waste treatment, Canada.
Identifiers: Newmarket, Ontario.

This study, designed to assess the ability of the anaerobic digestion process to accept the sludge produced by the addition of hydrated lime to the raw sewage of a conventional activated sludge plant, was supported under the Canada-Ontario Agreement on Great Lakes Quality. The study was carried out in conjunction with full-scale phosphorus removal at the Newmarket 2.0 MIGD activated sludge plant. An intensive sampling program on the two-stage anaerobic digester carried out between March, 1972 and March, 1973 is described. The study determined that normal digester operation when receiving lime sewage sludge may be anticipated, but that care should be used to eliminate shock loading effects when starting up a digester on lime sewage sludge. (Environment Canada)

EFFLUENT POLISHING BY FILTRATION THROUGH ACTIVATED ALUMINA, VOLUME II, (MARCH, 1975).
Pollutech Pollution Advisory Services Ltd., Orville (Ontario).
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 40, Environmental Protection Service, Environment Canada, Ottawa, Canada, April, 1976, 110p. 10 tab, 12 fig, append. 73-5-4.

Descriptors: *Effluents, *Filtration, Water pollution control, Phosphorus, Lime, *Waste water treatment, Sewage, Costs, Municipal wastes, Canada, Treatment facilities.
Identifiers: *Effluent polishing, *Activated alumina columns, Waterloo, Ontario, Sodium hydroxide.

Chemically pretreated secondary effluent from the Waterloo Water Pollution Control Plant was polished in pilot scale activated alumina columns. Various regeneration modes for removal of phosphorus from the saturated alumina were investigated. The feasibility of lime treatment of the regenerant solutions to allow continued reuse of the caustic was evaluated. Capital and operating cost estimates were developed based on the findings of the study. All phases of the process, phosphorus adsorption, sodium hydroxide regeneration and lime precipitation were found to be technically feasible. The adsorptive capacity of fresh activated alumina was approximately 4 mg P/g Al203, but was significantly reduced after several saturation-regeneration cycles. One through elution with 15 bed volumes of 1N NaOH was the most efficient regeneration mode. Continuous recirculation of small volumes of caustic did not improve the regeneration efficiency. Activated alumina losses during regeneration were minimal and did not account for the loss of adsor

ive capacity of the bed. Lime treatment of the egenerant solutions at a dosage of 8 g/l effectively removed the phosphorus to allow reuse of the odium hydroxide solution. However, continued me addition adversely affected the settling properties of the precipitate and further studies are equired in this area. (See also W76-10491) Environment Canada)

AND DISPOSAL OF SEWAGE SLUDGE, OLUME III, APRIL 1974 - MARCH, 1975,
Guelph Univ. (Ontario). Dept. of Microbiology; nd Guelph Univ. (Ontario). Dept. of Land Resources Science.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 35, Environmental Protection Service, Environment Canada, Ottawa, Canada, February 1976, 282p., 11 fig., 226 ab. 72-5-17.

Descriptors: *Sewage sludge, *Sewage treatment, Land use, Hazards, Rates of application, Soils, Runoff, Heavy metals, Microbiology, Seasonal, Seepage, Phosphorus, Crop response, *Waste isposal, *Sewage disposal, Water reuse, Recycling.
dentifiers: *Land disposal, Soil characterization.

Described are runoff studies with fall, winter and pring applied sewage sludge, and field rate and ource of sludge studies with bromegrass on a oam soil and with corn on a loam, a sandy loam nd a clay loam soil. A greenhouse trial with different rates and sources of sludge on two soils at hree pH levels is also reported. Fluid digested ewage sludges from calcium oxide treatment of Newmarket sewage, aluminum sulphate treatment f Kitchener sewage and ferric chloride treatment f North Toronto sewage were used. Chemical nalyses of the sludge, soil nitrogen, crop yields nd nutrient and metal content of crops are resented along with microbial studies of the ludge and the crops grown. detailed descriptions f the soils used are also presented. In runoff studies, losses of nitrogen and nutrients were low in 974, lower than 1973. In the field, crops esponded to sewage, responses being similar in ost cases to those from chemical fertilizers. About twice as much nitrogen was required from ludges as from ammonium nitrate to produce a articular yield. At higher rates of sludge applicaion, levels of nitrate toxic to animals were approached. Sludges increased sodium bicarbonate oluble ('plant available') phosphorus quite markedly, and this effect was greatest with calcium ludge. Cadmium, nickel and zinc concentrations n crops increased appreciably with additions of ludge high in metals. (Environment Canada)
W77-02756

PILOT SCALE EVALUATION OF A PHYSICAL-CHEMICAL WASTEWATER TREATMENT SYSTEM FOR COMBINED SEWER OVERFLOWS.
Pollutech Pollution Advisory Services Ltd., Oakville (Ontario).
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 36, Environmental Protection Service, Environment Canada, Ottawa, Canada, 1976, 96 p, 27 fig, 29 tab, 19 ref. 4-8-29.

Descriptors: *Waste water treatment, *Sewers, Overflow, Storm water, Suspended solids, *Pilot plants, *Screens, Gravity, Separation techniques, Filters, Chemicals, Ozone, *Combined sewers, Treatment facilities.
dentifiers: Oakville, Ontario, Strainers, Microstrainer(R), *Ozonation.

A pilot scale investigation of the feasibility of using coarse screening, microscreening, and ozonation for the treatment of combined sewer overflows is described. The pilot scale system consisted of a Crane-Cochrane Microstrainer with 23 micron screen openings and an ozone generator. The dilute waste concentrations anticipated in combined sewer overflows were simulated by diluting raw sewage with tapwater. The contaminants measured were BOD, total organic carbon, suspended solids, total phosphorus, oil and grease, and total coliforms. The effects of waste strength and hydraulic loading were studied by varying the dilution of the raw waste and controlling the throughput of the unit. The contaminant removal efficiency decreased with the degree of dilution of the raw sewage, and the hydraulic loading on the Microstrainer increased. The effect of ferric chloride and polyelectrolyte chemical addition prior to microscreening was investigated, but no beneficial effect on the treatment efficiency was observed. Ozonation reduced the concentration of all measured contaminants including suspended solids. At a 20 mg/l ozone dosage in a continuous ozonation reactor with a nominal 15 minute retention time, COD removals of 40 to 50 percent were observed. Microscreened raw sewage spiked with lead to simulate street runoff showed a 35 percent reduction in lead concentration. The average removal efficiency of the pilot scale treatment system for all experimental conditions was 67% BOD5 removal, 40d% suspended solids removal, 26% total phosphorus removal, and greater than 99.9% total coliform reduction. MODIFICATION OF THE TRADITIONAL SEQUENCE FOR THE TREATMENT OF WASTEWATERS FROM METAL FINISHING INSTALLATIONS,
Environmental Protection Service, Ottawa (Ontario).
L. Buffa.
(Water Pollution Control Directorate) Economic and Technical Review Report, July 1976, 12p., 3 fig, append.

Descriptors: *Waste water treatment, *Metals, *Heavy metals, Separation techniques, Effluents, Regulation, Chemical precipitation.
Identifiers: *Metal finishing plants, *Cyanides, Precipitation(Treatment), Clarification, Chemical treatment.

This analysis was initiated as an attempt to define the effect a controlled amount of dilution water would have on the amount of contaminats discharged from metal finishing operations and their concentrations. A simplified 'traditional' chemical treatment system has been used as a model to arrive at a relationship between quantity and concentration of a given contaminant, and the ratio volume of treated process water to volume of dilution water. This relationship has been used to discuss a modified treatment system applicable to wastewater from metal finishing installations. (Environment Canada)
W77-02762

REMOVAL AND RECOVERY OF METALS FROM SLUDGE AND SLUDGE INCINERATOR ASH,
Canada Centre for Inland Waters, Burlington (Ontario).
B. G. Oliver, and J. H. Carey.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 33, Environmental Protection Service, February 1976, 58p., 16 fig., 22 tab, 31 ref. 74-3-15

Descriptors: *Sludge treatment, *Heavy metals, Copper, Zinc, Nickel, Cadmium, Trace elements, Temperature, Costs, Sludge digestion, Phosphates, Aqueous solutions, Electrodes, Electrochemistry, *Waste water treatment, Recycling.
Identifiers: *Sludge incinerator ash, Sulphuric acid, Copper struck graphite and aluminum electrodes, *Metal recovery, *Metals removal.

The electrochemical plating of Cu, Zn, Ni and Cd from aqueous solutions has been studied using standard plate type electrodes and improved efficiencies were attained with fluidized bed electrodes. Because direct electroplating from sludge was inefficient, acid and base additions were made to solubilize the metals prior to plating. Most of the metals and phosphorus in the digested sludge could be dissolved by adding sufficient H2SO4 or HC1 to lower the sludge pH to 1.5. The average cost of acid required per ton of dry solids was $41 for the H2SO4 and $77 for HC1. Little economic advantage would be gained by recovering sludge constituents, since processing costs for the large volumes of dilute leachate would be high. The metals and phosphorus in sludge incinerator ash can be solubilized with H2SO4 in a countercurrent stepwise process which uses most of the acid. Further processing of the H2SO4 leachate for recovery of valuable constituents is complicated by the presence of large quantities of iron in the leachate. Neutralization of the leachate with NaOH precipitates all the metals and phosphorus. Treating this precipitate with a hot NH4OH - (NH4) 2SO4 mixture resolubilizes most of the trace metals and phosphorus leaving iron oxide in the solid phase. Electroplating can remove Cu, Zn, Ni and Cd from the ammonia leach, and ammonium phosphate can be recovered from the solution after electrolysis. While processing costs for incinerator ash are much less than those for wet sludge, the procedure does not appear to be economically viable except for very large treatment plants. CHROMIUM RECOVERY FROM SLUDGES PRODUCED FROM CHROMATE-INHIBITED COOLING WATER,
Goodyear Atomic Corp., Piketon, Ohio, Process Technology Dept.
L. E. Deacon, M. E. Holland, and R. I. Kaplan.
(1975). 16 p, 4 tab, 4 fig, 6 ref.

Descriptors: *Waste water treatment, *Cooling water, *Chromium, Chemical wastes, Water pollution sources, Water chemistry, Separation technique.
Identifiers: *Calcination.

The technical feasibility of recovering chromium values from sludge produced when recirculating cooling water is treated to remove toxic hexavalent chromium before discharge is demonstrated. The most successful approach involved calcination of the sludge with added soda ash at 850-900C for about 30 minutes in an open-air calciner. 75% recovery yields were recorded. The process converts the chromium to water-leachable sodium chromate. (Chilton-ORNL)

SILICA IN WATER IN RELATION TO COOLING TOWER OPERATION,
Los Alamos Scientific Lab., N. Mex.
C. Wohlberg, and J. R. Buchholz.
Report LA-UR-74-1895, 56 p, 17 fig, 51 ref, append. International Corrosion Forum Devoted Exclusively to the Protection and Performance of Materials, Toronto, Ontario, Canada, April 14-18, 1975. W-7405-Eng-36.

Descriptors: *Water purification, *Cooling water, *Cooling towers, *Silica, Chemistry, Separation techniques, Water pollution, Heat transfer, *Waste water treatment.

Evaporation of cooling tower water concentrates the initial silica content of the water and causes it to precipitate on heat-exchanger surfaces, thus interfering with heat transfer. It was concluded that the solubility of silica is a function of the species with which it is in equilibrium. The data cited indicate that magnesium and aluminum ions play a large role in natural systems in removing silica from water. These ions probably also have a large role in the deposition of silica in heat exchangers and have been the basis for some commercial methods of SiO2 removal from water. (Chilton-ORNL)

CHEMICAL COMPOSITION AND METHODS FOR PURIFYING PHENOLIC WASTE WATERS RESULTING FROM RAPID THERMOLYSIS OF LIGNITES OF THE IRSHA-BORODINO AND MOSCOW REGIONS,
Kaliniskii Politekhnicheskii Institut (USSR).
L. I. Volkova, A. M. Kunin, N. N. Amagaeva, G. V. Nenast'eva, and A. Y. Tkachenko.
ORNL-tr-2944, p 20-25, 1 tab, 5 ref. Translated from Trudy Kalininskogo Politekhnicheskogo Instututa, Moscow, Vol 13, 1972.

Descriptors: *Water pollution, Waste water(Pollution), Water quality, Chemical wastes, *Phenols, Chemistry, Coals, Lignite, *Water purification, *Waste water treatment, Industrial wastes.

The paper reports on the possibility of dephenolizing waste waters from the rapid thermolysis process by an extraction method as follows: the tar water solution, after preliminary filtration and neutralization, is extracted with butyl acetate with a total solvent consumption of 20% of the water volume, at 20-22C and with a standing time of 60 min. Data showed that water from the non-pyrolysis regime has an extraction coefficient for total phenols of 64-73%, for nonvolatiles of 49.5-63.2% and for volatiles of 94.9-96.5%. In the extraction of phenolic waters obtained in the process with additional pyrolysis, there is a higher extraction coefficient for total phenols(87-90%) but near the same extraction coefficient for volatiles and nonvolatiles. It was concluded that tar water obtained in rapid thermolysis decomposition of tar water and Irsha-Borodino brown coals have a complex chemical composition and are difficult to purify. (Chilton-ORNL)

MEASURES TO COUNTERACT DAILY WATER POLLUTION: DEVELOPMENT TENDENCIES IN USA, (IN SWEDISH),
Swedish Council for Building Research, Stockholm.
G. Svensson.
Vatten 31(3), p 198-212, 1975.

Descriptors: *Sewage disposal, *Sewage treatment, *Sewerage, *Mathematical models, *Cost analysis, *Urban runoff, *Combined sewers, Planning, Runoff, Waste storage, Rainfall-runoff relationships, Separated sewers, Biodegradation, Chemical degradation, *United States.
Identifiers: Sweden, Denver, Chicago, Washington(D.C.).

USA work on sewage disposal problems is reviewed to determine the best and cheapest solution applicable in Sweden, particularly with the problems of overloading caused by severe rainfall. Whether a combined sewage system or the most costly separate sanitary sewers should be used is discussed. Experience in Denver, Colorado, Chicago, Illinois and Washington, D. C. is described. Mathematical models and cost estimates for different schemes in other cities are presented. Emergency plans for Washington involve systems combining biological and chemical purification of sewage capable of dealing with large volumes of dirty runoff water. A combined sewage system including an overflow storage space can cope with most Swedish problems with cost savings provided there is a combined network of sewage mains.

Vatten 31(3), p 274-285, 1975.

Descriptors: *Water pollution, *Waste water treatment, *Sewage treatment, *Sewage effluents, *Nutrient removal, *Urban runoff, Lakes, Water pollution treatment, Phosphorus, Storm water, Waste water(Pollution), Water pollution sources.
Identifiers: Diversoni, Motala, Lake, Recovery, Sweden, Uppsala, Polluted Lakes.

The building of advanced wastewater treatment plants resulted in a lower P content in sewage effluent. In addition to the pollution from the treatment plants, diffuse municipal loading (urban storm water and wastewater) adds nutrients to the wastewater receiving waters. When studying the recovery of polluted lakes, it is essential to quantify the total transport of nutrients. The quality of urban storm water from areas of different structure and the yearly amount of pollution originating from diffuse sources in Motala and Uppsala (Sweden) were studied. Great amounts of diffuse pollution in relation to sewage effluents were found. For an optimal water-control program effort should be made to minimize diffuse pollution sources.

5E. Ultimate Disposal Of Wastes

INCINERATION OF INDUSTRIAL WASTES,
Minnesota Mining and Mfg. Co., St. Paul.
C. R. Lewis, R. E. Edwards, and M. A. Santoro.
Chemical Engineering/Deskbook Issue, Vol. 83, No. 22, p 115-121, October 18, 1976. 2 fig.

Descriptors: *Chemical industry, *Incineration, *Air pollution, *Waste water treatment, *Treatment facilities, Chemical wastes, Industrial wastes, Neutralization, Chemical reactions, Sedimentation, Heat transfer.
Identifiers: Wet scrubbing.

An incineration facility for destroying toxic chemical wastes is described. The heart of the system is a 23,000-kilocalorie/hr rotary kiln incinerator which is used for the disposal of solvent-contaminated wastes. The purpose of incineration is to produce stable oxides that can be returned to the environment without causing detrimental effects. Satisfactory combustion in the primary and secondary chambers of the incinerator is the key to air pollution control; however, the incinerator is also outfitted with a wet scrubber system. The scrubber system consists of five major components: a quench chamber, a venturi scrubber, a mist separator, an induced-draft fan, and a 200-foot stack which acts like a reflux condenser. The scrubber effluent is subject to acid neutralization, chemical treatment, and sedimentation before it is discharged to the receiving stream. Pilot studies involving attempts to recover heat from the incinerator in the form of steam indicate that such recovery is not economically attractive because of the sizable distribution system required. HISTORY OF OCEAN DUMPING IN THE GULF OF MEXICO,
Texas A and M Univ., College Station. Dept. of Civil Engineering
R. W. Hann, Jr., T. F. Zapatka, M. C. Zapatka, and C. Baskin
Sea Grant Program Report No. TAMU-SG-77-201, October 1976. 96 p, 12 fig, 5 tab, 31 ref. SG 04-6-158-44012

Descriptors: *Gulf of Mexico, *Waste disposal, *Permits, Sewage disposal, Sludge disposal, Public rights, Oceanography, History.
Identifiers: *Ocean dumping, *Public Law.

A historical look at the practice of ocean dumping in the Gulf of Mexico is presented. The past and present ocean disposal practice in the Gulf of Mexico is documented. The Gulf of Mexico is defined with respect to physical, chemical, and biological characteristics. The currents, temperatures, and salinities are reported as well as a list of major river systems that drain into the Gulf. The economic importance with respect to fisheries and oil and gas reserves is discussed. The report is divided into tow sections: the Corps of Engineers permitting system, and the EPA permitting system. Some information is included on who is known to have been dumping and what they have dumped, and when the dumping took place. Under the EPA permitting system, there is much more information concerning dumping. Excerpts from the Marine Protection, Research and Sanctuaries Act of 1973, which defines the national policy toward ocean dumping, are given as well as the types of permits issued under this law. Actual permits issued by the EPA were obtained from the regional office in Dallas, Texas and reviewed. A summary of each permit was made and presented. A short section discussed the more commonly used methods of discharging wastes from vessels such as jet-dispersion, hopper-barge, wake mixing, and container discharge. (NOAA)
